 Aloe, the propagation of an, by leaves, 423
 Alpine garden, the, 212; hardy Opuntias for the, 379
 Alpine plants under alternations of temperature, 290
 Alps, a storm-tossed Pinus Cembra on the, 459
 Alternation of generations, 224
 Althæa, Primrose Gem, 114
 Amaryllis Belladonna var. kewensis, 298, 339, 354
 Amateur, what is an, 336
 America, a national university for, 140
 America, forestry demonstrations in, 383; fruit crops in, 289; the Apple crop in, 383
 American Blackberry and Dewberry, the, 249; blight, an heroic remedy for the, 371; tree seeds, 256
 American notes, 46, 120, 140, 237, 316, 364, 382
 Amonimus, 61
 Ampelopsis Veitchi, its proper name, 461
 Androsace sarmentosa, wild, in Norway, 126
 Annuals, three good, 308
 Ant-destroyers, 34
 Anthurium crystallinum var. illustre, 417
 Anthracnose, the development of some, 164
 Ants, a method of trapping, 32
 Antwerp artisans as gardeners, 322
 Antwerp, Chrysanthemums at, 421
 Antwerp Horticultural Exhibition, 88
 Aphides and the use of carbolic-soap, 125
 Aphides, the Lady-birds and, 444
 Aphis on Beech-trees, 354
 Apiary, the, 9, 49, 95, 121, 161, 197, 287, 319, 360, 385, 437, 469
 Aplopappus ericoides, 382
 Apospory in Ferns, 62
 Apothecaries' garden at Chelsea, the, 126
 Apple, Andenken an Palandt, 164
 Apple-barrel, a standard, 181
 Apple crop in America, the, 383
 Apple, diseased, 325
 Apple, Lewis' Incomparable, 371; the, in market-gardening, 380; the place of origin of the Baldwin, 387
 Apple-trees, cankered, 372; diseased, 462; dwarf or bush, 233; for market cultivation, 232; planting, 118; pyramidal, 234; Apple with "glassiness," 325
 Apples and Pears, the cracking of, 341
 Apples, American and British, 308; in Scotland, 346; Jas. Grieve and others, 277; notes on, 268; picking, grading, and packing, 231; polishing, at shows, 277; some new, 309; varieties of, for the market gardener, 192
 Arbor tristis, 61
 Arzyreia speciosa, 350
 Aristolochia siphon, 137
 Arizona, the Date-Palm in, 316
 Artificial manures, the use of, 46, 447

Arundinaria aristata, 211; A. auricoma, flowering of, at Castlewella, 181; A. metallica, 274; A. nitida, 211; A. Laydekeri, a seedling plant of, 274
 Ash-tree, leafage of the, in the North, 12
 Asparagus, culture about London, 7; rust, 120; A. Sprengeri fol. var., 221; varieties of, 462; winter, forcing of, in America, 46
 Aster, Dwarf Mignon, 324; the wild form of the China, 254
 Asters, diseased, 128; perennial, at Kew, 289; perennial, in Scotland, 277
 Astilbe, Gerbe d'Argent, 123
 Astragalus alpinus albus, 73
 Auctioneer's botany, 474
 Australian desert, the West, 433
 Azalea indica out-of-doors at Clyne Castle, 101
 Azores, Hydrangeas in the, 336, 457

B

BAARAS, 61
 Bacteria in hailstones, 288
 Baldwin Apple, place of discovery of the, 387
 Bamboos, 86, 211; at Royal Horticultural Society, 91; hardy, 246, 258, 274; A. B. Freeman-Mitford's lecture on, 92
 Barham Court gardens, 251
 Barr, Mr. Peter, 105; in America, 406
 Bath, street trees in, 238
 Bean, the Florida Velvet, 51, 146
 Beans in Guernsey, 462
 Bedding-out, the system of, 221
 Bedding, the summer, at Hampton Court, 13
 Beech, the purple, 423, 445; in Miss Sullivan's garden, 304
 Beech trees, aphid on, 354; coccus on, 371; dying, 55
 Beeches, The, St. John's Wood, Orchids at, 314
 Bees, in a jam factory, 257; late swarming of, 222
 Beet, globe-shaped, 292
 Beetle, a Dendrobium (Xyleborus morigerus), 388
 Begonia, a monstrous, 372
 Begonia Bavaria, 78
 Begonia Gloire de Lorraine, 339, 407, 444; at Highbury, 440
 Begonia venosa, 462
 Begonias, Lemoine's, new double semperflorens, 334
 Belgian Campine, the founding of a school of horticulture in the, 272
 Belgium, a collection of Cacti in, 127
 Benevolent Institution, Gardeners' Royal, 166, 386, 406, 441; alteration of address, 352
 Bibliography and history of the Green Gage group of Plums, 465
 Bicton, 153, 177, 190
 Bidens atrosanguinea superba, 296
 Bignonia purpurea, 399
 Biological exhibition in the Zoological Gardens, Clifton, 240
 Birds, as gardeners' friends, 277; in the garden, 292
 Birdsell, York, Carnations at, 47
 Bishopstowe Gardens, Torquay, 416
 Blackberry and Dewberry, the American, 249
 Blackberries, 165; British, 184
 Blackbeetles, chocolate as a trap for, 400
 Black Currant x Gooseberry, 55
 Black Currant, the Golden, 54
 Blindness in Strawberry, cure for, 89

Blooms, wired and cupped, 354
 Blue flowers, 292
 Bog garden, the water and, 45

 Broom House, Fulham, 348
 Brunsvigia Cooperi, 345
 Bryanstone House, 429
 Buda Pesth, Hungarian horticultural exhibition at, 220
 Buddleia variabilis, 138
 Bulb garden, the, 345, 398
 Bulb-growing, the principles and practice of, 361, 422, 442
 Bulbs and tubers, the passive life of, 434
 Bulbs, the timely planting of, 388, 423, 445, 461
 Bulbous plants, planting, 348
 Bulbous plants, short notes on, 98, 135, 195
 Burbank, Luther, a successful hybridiser, 366
 Burford Lodge, gardens at, 87
 Butler's Hudibras, misquotation from, 108

C

CABBAGE, concerning the, 174
 Cactaceæ of the Galapagos Islands, the, 265
 Cacti and other succulents, cultivation of, 134; in Belgium, 127; the cultivation of, by F. Laet, 258
 Cactus Dahlia, "Trump," 436; new varieties of, 460
 Caladiums, 350
 Calanthe x Veitchi, 433
 Calceolaria amplexicaulis, 292, 383
 Calceolarias, 88
 Callistephus hortensis, 268
 Calochortus clavatus, 51
 Cambridge Botanic Garden, annual report of the, 32
 Cambridge Lodge, Orchids at, 2
 Camellia as a seaside plant, the, 365
 Camellias, seedling, 246
 Campanula betulifolia, 424; C. Medium calycanthema, 65, 89; C. maritima, 33, 108

Campanulate Foxgloves, 10
 Canada, and the preferential tariff, 164;
 horticultural prospects in, 221;
 tender fruits from, 47
 Canadian industry, a new and profit-
 able, 309
 Candytuft "Little Prince," 324; C.,
 "White Spiral," 308
 Anna, a sportive, 379; C., indica
 ripening seed in the open, 258; C.,
 the, as a decorative plant, 43
 annas, 379
 Cape Gooseberry, the, 389
 Cape, Grapes from the, 47
 Cape Town, *Rosa gigantea* flowering
 at, 421
 Carbolic soap and greenfly, 90
 Carlew gardens, Falmouth, 399
 Carnation, a seedling, 73; C. Isinglass,
 120; C. Queen of the Yellows, 125;
 C. Mrs. W. Buckler Lethbridge, 52;
 C. Souvenir de la Malmaison, the
 cultivation of, at Dover House, 3;
 C., sport in, 142; C., staking, 407
 Carnations at Birsall, York, 47;
 border, 109, 221, 292; C. from Kelso-
 on-Tweed, 164; C., Mr. Martin
 Smith's, 113
 Carrot, a monstrous, 460; Carter's
 Long-forcing, 47
 Carrots in India, 457; varieties of, 48
 Caryopteris Mastacanthus, 292
 Cassia corymbosa, 339
 Catalpa hybrida, 251

 carpum, 301
 Caterpillars, and how to rid them from
 the land, 462
 Cattle Show, the, at Smithfield, 421
 Cattleya dolosa, 98; C. granulosa,
 134; C. x *Hardyana* var., 398;
 C. x *Hardyana* Mrs. C. E. Chrimes,
 282; C. labiata, 398; C. labiata
 alba, 330; C. labiata Schrodere, &c.,
 256; C. x *Maroni*, 332; C. Mossie,
 at Messrs. H. Low & Co.'s, 2; C.
 O'Brieniana, 378; C. superba
 splendens, 300; C. Warscewiczii, 22;
 C. Warscewiczii var., 398
 Cauliflower, early dwarf Snowball,
 108; Veitch's extra early forcing,
 48
 Cauliflowers, Danish, 285; Snowflake,
 for forcing, 70
 Ceanothus Gloire de Versailles, a good
 blue-flowering plant, 292
 Celluloid labels, 52
 Cercis Siliquastrum, the propagation
 of, 428
 Cereals, recent observations of Prof.
 Eriksson on the rusts of, 269
 Cereus peruvianus monstrosus, 174
 Cetraria islandica, 179
 Ceylon, the rainfall in, 29
 Chacun à son goût, 179
 Chamærops excelsa in Dr. Hamilton
 Ramsay's garden at Torquay, 420
 Chamærops exelsa flowering out-of-
 doors, 308
 Channel Isles, market gardening in
 the, 452
 Charities, the gardening, 12, 33, 71,
 180
 Chelsea physic garden, 126, 441
 Chemical manures, lecture upon, 46,
 447
 Cheques, cashing crossed, 322
 Cherry-leaves, diseased, 55

 Chrysanthemum blooms, wired and
 cupped, 354

Chrysanthemum Congress at Lyons
 list of papers read at the, 51
 Chrysanthemum disease, the (rust),
 269, 292, 307, 324, 371, 407, 428;
 literature, recent, 213; C. Madame
 Carnot, 410; C. Mrs. G. Gruner-
 wald, 276; C. nipponicum, 348;
 notes on, 278; C. R. Hooper Pear-
 son, 368
 Chrysanthemum show at Aquarium,
 through French eyes, 442
 Chrysanthemum show at Milan, 406
 Chrysanthemum, the modern, 352
 Chrysanthemum, unseasonable flower-
 ing of, 69
 Chrysanthemums, 314, 341, 346, 367,
 404, 458; a liquid fertiliser for, 406;
 at Antwerp, 421; colonial novelties
 in, 410; cultural notes upon, 284;
 damping of, 342; in Guernsey, 453;
 in Scotland, 409, 445, 462; popular
 show, 410; some new white varieties
 of, 387; the annual propagation of,
 409; the crown and terminal buds
 of, 424; novelties in, 425, 458; with
 aerial roots, 324
 Cider-making in France, 25
 Cinchona in Java, 237
 Cinerarias, cultivation of, 459; hybrid,
 101
 Cirrhœa viridi-purpurea, 190
 Cissus discolor in fruit, 52
 Clematis paniculata, 268
 Clinostigma Mooreanum in Lord
 Howe's Island, 450
 Cliveden, the gardens at, 1
 Clyne Castle, Azalea indica at, 101
 Cobbett's Corn, 90
 Coccus on Beech-trees, 371
 Cœlogyne lagenaria, 314
 Cold storage Pæonies, 69
 Coleus macrophyllus nanus, 296
 Colonial notes, 47, 66, 100, 178
 Combe Abbey, the gardens and gar-
 dener at, 229
 Compensation Act, 1897, the Work-
 man's, 441
 Continental Novelties, 295, 324, 436

 Co-operative, the National Festival,
 142, 162
 Corn, Cobbett's, 90
 Corn, Indian, crops of the United
 States, 406
 Cornish Daffodils, 353
 Cornish garden, the chronicle of a
 little, 21, 97, 210, 330, 433
 Cornwall, South, notes from, 398
 Coryanthes maculata, 267
 Cottage Gardeners' Compensation Act,
 the, 276
 Covent Garden Market, reminiscences
 of, 173, 194
 Coxcombe, exhibition, 460
 Crassula coccinea, and Rochea falcata,
 hybrid between, 143
 Crassulaceous hybrid, 147
 Cratægus Oxyacantha var. horrida, 13
 Cratægus, noteworthy forms of, 466
 Crinum giganteum, 298; C. purpuras-
 cens, 398
 Crocosmia, 307; C. imperialis, 324;
 C. aurea, hardness of, 372
 Crocus lævigatus, 466; C. nudiflorus in
 England, 88; C. speciosus, 354
 Crown forests, 240
 Cucumber, a, for window culture, 436
 Cyanide of potassium as an insecticide,
 50, 432
 Cyclamen europæum with long rhizo-
 mes, 372; C. latifolium in North
 Africa, 52
 Cyclamens, the hardness of, 199
 Cymbidium Traceyanum, 314; C. Hut-
 toni, 2
 Cyperus fertilis, 8
 Cypripedium insigne malformed, 342;
 C. i. Harefield Hall var. 466
 Cypripedium or Paphiopedilum, 414
 Cyrtanthus sanguineus, 298
 Cucumber, "Alabaster," 295
 Cucumbers, twin, 32
 Currant, black, the golden, 54; shoots
 falling, 55
 Currant, crop of Greece, the, 304; red,
 La Versailles, 125

D

DABEOCIA polifolia, 382
 Daffodils in Cornwall, 353; in Guern-
 sey, 453
 Dahlia-Cactus, Fantasy, 238; Society,
 the National, 12; "Trump," 436;
 new varieties of, 460
 Dahlias, 184; at the Crystal Palace,
 198; D. Cactus, 249, 324; at Slough,
 302; crossed by Sunflower, 325,
 426; storing, 302, 459
 Dalkeith in June, 41
 Danae nigrescens, 413
 Danish Cauliflowers, 285
 Darlingtonias, 338
 Date Palm, the, in Arizona, 316
 Dendrobium aequum, 300, 362
 Dendrobium-beetle, a (*Xyleborus mori-
 gerus*), 388
 Dendrobium Dearei, 193; D. densi-
 florum, a fine plant of, 184; D. for-
 mosum varieties, 301; D. f. gigan-
 teum at Gunnersbury House Gardens,
 472; D. Phalænopsis album, 433
 Denmark, 285
 Desmodium tortuosum (the Beggar
 Weed), 256
 Deutzia corymbiflora, 265
 Devonshire gardens, some, 117, 165,
 291, 298, 416
 Dianthus Atkinsoni, 124; D. Hedde-
 wigii Queen of Holland, 324
 Diaspis amygdali, a fruit scale-insect,
 245
 Diervillas in autumn, 196
 Digging, autumn v. spring, 372
 Digitalis, campanulate, 10
 Dimerous Cattleya granulosa, 147
 Diospyros Kaki, 337; fruit of, from
 south wall in Canon Ellacombe's
 garden, 342
 Disas, the cultivation of, 203
 Disease of Lily, a cure for the, 42; of
 Pæonies, a, 124
 Diseases of plants, 69; of the Potato,
 134
 Dorchester public gardens, the, 299
 Druggist's garden, a, 134
 Dublin note, 378
 Dulcote, Orchids at, 154
 Dulwich, Hollyhocks at, 291

E

THE

Gardeners' Chronicle.

SATURDAY, JULY 2, 1898.

CLIVEDEN, MAIDENHEAD.

CLIVEDEN can be seen in all its glory in the last week of May, and the early days of June. It could be seen at a great advantage recently, as the rains had quickened the growth of tree, shrub, and grass, and in the veering wind and shade of a May afternoon, the stretches of verdure gleamed in the sunshine, and anon the hanging woods darkened in changing tones, which seemed to vary, not only from hour to hour, but from moment, as fleecy clouds budded across the sky carried before the brisk easterly wind. Below the woods could be caught a glimpse of the silvery Thames, winding its way towards the Royal borough in the distance. Flower, tree, and shrub mingled with the embrace of greenery of the woods, and from the clump of trees, among which the Horse-chestnut stood up tall and strong, sounded the ocsin of the summer time—"the cuckoo's lithesome note."

The park and woods of Cliveden occupy the summit and slope of a lofty ridge which overhangs the river, presenting to view a scene of picturesque beauty scarcely equalled in this part of England. The mansion is built on a broad terrace, which rises above the lawn on the heights, commanding a prospect not inferior to that from the north terrace of Windsor Castle, but looking a different way. The original edifice was built in the reign of Charles II., by George Villiers, Duke of Buckingham, the dissolute courtier who has been immortalised by Dryden and Pope in some of their most powerful passages of satire. It was to this place that he conducted the Countess of Shrewsbury after the murder of her husband, in a duel, of which she was a spectator, disguised as a page, and holding the horse of her paramour. The house built by Villiers was one of red-brick with stone dressings, having a noble terrace 433 feet in length, with square wings and sweeping colonnades. It was burnt down in 1795 by the carelessness of a maidservant reading a novel in bed.

In 1830 Cliveden was rebuilt by Sir George Warrender, of Lock End, from whom it was afterwards purchased by the Duke of Sutherland. Another conflagration in 1849 having destroyed the mansion erected by Sir George Warrender, the present structure was built by his Grace, the architect being the late Sir Charles Barry, whose design for the centre is said to have been suggested by that of Inigo Jones for old Somerset House. The estate eventually passed into the hands of the Duke of Westminster, who a few years ago disposed of it to W. Waldorf Astor, Esq., who now resides there. Under the capable management of Mr. A. B. Wadds, the gardens and grounds are in the very best condition, and at no previous visit has the place been seen to better advantage. To go into full details of every feature would

require an immense space; it is possible to notice a few leading ones.

A new kitchen-garden of considerable extent, with a solid wall all round, laid out by Mr. Wadds three years ago, is now of considerable value as a source of production. It has a slight slope to the west, and, as is usually the case, it is in two main divisions, divided in the centre by a broad gravelled walk, with spacious side-walks, and a broad border all round. On the north wall are Plums and Morello Cherries, on the south Peaches and Nectarines, on the east Apricots, and on the west Pears and a few Cherries. The trees on walls are doing remarkably well, and getting into a fine bearing condition. Of Cherries, Géant de Hedelfinger, a large and late black variety, is a vigorous grower, and bearing freely; Early Rivers is this season a shy bearer.

Vegetables are in great demand at Cliveden, and large quantities are forced in early spring. All the growing crops in the open looked remarkably well, and Mr. Wadds spoke very highly of Veitch's Extra Early Pea for supplying a first crop. Beck's Gem, Chelsea Gem, and other varieties are largely grown for a supply. Mr. Wadds cultivates a select stock of Ellam's Early Dwarf Cabbage, and by sowing the first week in July is able to cut nice Cabbages before Christmas; a sowing made the first week in August gives the spring supply; and a sowing is also made in April for early autumn use. On an east border is a very good herb-garden stocked with all the sorts used for culinary purposes, a large supply having to be provided.

Passing from here, and crossing a grassy glade, a new road is reached, by which access is had to the large circular fruit garden abutting on the road from Taplow. This is quite unique in its way. All round it is an iron-palisading 5 feet in height, and covered overhead by a 1-inch mesh wire-netting, resting upon solid supports stretching from side to side. This is done to keep the birds from attacking the fruit, there being trees and shrubs round the garden. This circular garden is 85 yards in diameter, with two main walks of turf crossing each other in the centre, leading to a circular grass-walk all round with a 15-foot border between it and the palisading. It is thus divided in the centre into four main segments. Cordon Apples, Pears, Plums, and Cherries are trained over arches thrown across the turf walks, and the segments are variously planted; Apples here, Plums there, Cherries in another place, and so on.

There is a plantation of American Blackberries treated exactly as Raspberries, such as Kittatiny, Wilson Jr., and laciniatus. The first-named is the earliest, and has the best flavour. The fruit has not the large core of Wilson Jr., and is of a more robust constitution. Wilson Jr. follows this, and laciniatus is the latest, and makes a good succession till the wild Blackberries are ripe. It will be remembered that Mr. Wadds received an Award of Merit for fruit of these Blackberries at a meeting of the Royal Horticultural Society in August last. Generally, there is a good set of fruit in this garden, the wire-covering overhead serving as a protection against late frosts. The condition of the trees suggests good cultivation.

On the outside border are Red Currants and Gooseberries on the sunny side, the latter including several standards, with Black Currants and Raspberries on the cool-side, all promising for heavy crops. In certain open spaces in the centre are plantations of Strawberries. Cleanliness and order could be observed on every hand.

Was ever such a floral feast of Pansies pre-

sented to view before as that which bursts upon the sight when the terrace is reached? Mr. Wadds calculated there is an aggregate of 60,000 plants in flower, a large number in the long winding beds on the terrace, the remainder in the long stretch of beds stretching away along the green glade for a considerable extent. There were eight beds in duplicate. The first pair had a centre of Roses, a grass walk round, and then a 4 feet 6 inches border of Souvenir Pansy, light blue. The next pair had scarlet Rhododendrons, grass, and a border of equal width of Yellow Seedling Pansy. The third pair, Roses, bordered also with Roses. The fourth pair, white Rhododendrons, bordered by white Pansy, The Dove. The fifth pair had Tea Roses, and a border of Mauve Queen Pansy. The sixth pair, scarlet Rhododendrons, and a Celestial Blue Pansy as an edging. The seventh pair, like the third, were wholly of Roses. The eighth pair had white Rhododendrons, with a border of Cloth of Gold Pansy.

The series of beds were admirable illustrations of the floriferousness of the Pansy, and its adaptability for a spring and early summer display. Each border was composed of some 2,000 plants. By the end of June or early in July the Pansies are removed, and Asters, in colours and as numerous as employed, take their place. In addition there is a large circular bed in four divisions, each having a centre of Niphetos Rose, edged with yellow Pansy, and also a number of small circular beds with clipped Box edgings, filled with different coloured Pansies.

Under the terrace are the long raised beds, with a winding edge, and consequently of varying widths, edged with Ivy which forms a kind of wall; next to this a line of Aubrietia, and then ribbon lines of Violas and Pansies—first, Countess of Hopetoun, white; Mauve Queen, Cloth of Gold, Cliveden purple, Sovereign, The Duke, and others, each bed containing 15,000 plants all in splendid bloom, and forming a floral spectacle rarely seen.

In one of the long, low, span-roofed intermediate houses was a remarkable sight formed by a few plants of Begonia corallina, a rare species, and one of the handsomest of the shrubby kinds, trained up the uprights, and then all along under the apex of the roof, where it had formed dense festoons of bright coral-red blossoms, extending the length of several yards. Mr. Wadds said it was never out of flower; and one would not wish it even should be, for it forms a spectacle of rare beauty.

In every house devoted to plant-culture there were abundant evidences of high and successful cultivation, though there is an enormous demand for house decoration. Malmaison Carnations are a fine feature; some plants of Achimenes longiflora were splendidly bloomed. In the fruit-houses there were fine crops of Grapes, Peaches, Nectarines, Figs, Melons, &c.; and the space devoted to Tomatos and Cucumbers is very great, the demand being enormous.

The herbaceous garden, laid-out and planted by Mr. Wadds, is 190 yards in length by 28 yards in width, with turf-walks the whole length, which contains a representative collection, especially of those subjects which are adapted for cutting. It has been my pleasure to visit Cliveden on various occasions during the past thirty years, but I never before saw the place in better condition than at present, or more delightfully furnished. All the best traditions of the spring gardening, as carried out by John Fleming, are maintained by Mr. Wadds; every portion of the gardens under his care does him the greatest credit. R. D.

NEW OR NOTEWORTHY PLANTS.

CYMBIDIUM HUTTONI, Bth.

THIS remarkable Orchid, which, I believe, is not to be found in European collections, was first described by Hooker as *Grammangis Huttoni*. Its habitus affords the cooler mountain regions of the western part of Java, where, however, it is by no means common. Some years ago Dr. Konderz brought a living plant from Celebes. The pseudo-bulbs are naked, large, much compressed, ovoid, and bear usually three erect, lanceolate, leathery leaves at the top. The scapes are pendulous and equal, 8 inches long, and two-flowered; the flowers are not widely opened, and measure $1\frac{1}{2}$ inches in diameter. The upper sepal is broadly oblong, acute, concave; the lateral sepals are a little narrower, acute, the apical part is curved outward. The petals are lanceolate, acute, the apical half convex and reflexed. Lip erect, three-lobed, the side lobes are erect, the front lobe is curved downward, and warty. In the centre of the lip is a two-ridged crest. The sepals, the basal half of the petals, and the lips are dull light greyish, densely spotted with dull blackish-violet; the apical half of the petals is of a uniform blackish-violet. The column is arched, long, and blackish-purple, the anthers yellowish with minute purple spots.

Just as in *Grammatophyllum*, *Acriopsis*, and other Orchids, the roots produce numerous upright white secondary rootlets, that soon die off. By this, rootlets, dead leaves, twigs, &c., are retained, and form humus that the plant needs for its nourishment. It is very curious that the whole plant exhales a very peculiar, something patchouly-like odour; the odour of the flowers is also very singular, but not disagreeable. *Cymbidium Huttoni* is not to be reckoned among the fine or lovely Orchids, but as a curiosity it may find a place in the collections. *J. J. Smith, Buitenzorg (Java), May, 1898.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT CAMBRIDGE LODGE, CAMBERWELL.

THE collection of R. I. Measures, Esq., thanks to the skilful treatment of his enthusiastic gardener, Mr. H. J. Chapman, is famed for its complete set of Masdevallias, both of showy and of botanical species; and for the number of rare plants usually associated with Masdevallias, such as *Restrepia*, *Pleurothallis*, *Stelis*, *Octomeria*, &c., which it contains. It also affords many remarkable instances of sets of plants flourishing in the foggy suburban district of Camberwell, with which cultivators in some of the most salubrious spots in the British Isles utterly fail. Of these may be noted the collection of fine and sturdy plants of most of the species of *Phalaenopsis*, which now flower profusely, and bear large, fleshy and perfect leaves, notwithstanding the fact that some years ago, when Mr. Chapman entered on his charge, many of them were almost leafless, and otherwise in a very bad state. As plants of that kind can be re-established at Camberwell, growers in more favoured situations ought not to despair.

Another instance is the large bed of varieties of *Vanda suavis* and *V. tricolor*, which extends through two houses, the plants being in fine health, and bearing rich green leaves down to the pots, a few of them being already in flower. Of the same nature are a collection of East Indian *Aërides*, *Vandas*, *Saccolabiums*, &c., which are failures in many places, probably because they are kept too hot in the winter and too airy in spring and summer, which is their proper growing season. In flower among them are the fine *Saccolabium ampullaceum Moulmeinense*, of *Rollisson's Catalogue*, 1875, a giant compared with the ordinary form; *Vanda Parishii Marriottiana*, with several spikes; *Aeranthus Leonis*, with many spikes of its fragrant white flowers; several *A. modestus* and other species. Overhead, suspended so as to be nearer the light, are a fine series of varieties of hybrid *Cattleyas* and *Laelio-Cattleyas*, among which were

noted *L.-C. × Lady Wigan*, *L.-C. × Andreana superba*, *L.-C. × Sallieri*, and other fine kinds; also the beautiful white *Cattleya labiata*, *R. I. Measures*, *C. × Hardyana*, &c.

The Masdevallias are divided among three houses according to their requirements, the collection of the *Chimæra* section being suspended in the house, the stages of which are occupied by the large specimens of *Cymbidiums* now out of bloom. Among those of this section in bloom were a fine set of varieties of *M. Chimæra*, including *Roezli*, *Winniana*, &c. Of allied kinds in bloom were *M. bella*, the original specimen from Mr. Lee's collection, the unique *M. trinema*, figured in the *Gardeners' Chronicle*, 1890, p. 268, as *M. Lowi*, *M. Nycterinia*, *M. Carderi*, *M. Houtteana*, *M. caudata*, *M. c. xanthocorys*, *M. c. Shuttleworthi*, &c. Suspended with them and flowering profusely are the varieties of *Odontoglossum citreumum*.

In the lean-to Masdevallia-house there is a brilliant show of varieties of *M. Harryana*, the richest scarlet being *M. H. "Comet,"* the palest *M. H. lilacina*, *M. H. roseo-violacea*, and the apricot-coloured *M. H. armeniaca*. The forms of *M. ignea* were almost as showy and varied, and of others in bloom were noted *M. × Cassiope*, *M. × Hinckiana*, *M. × Gelseniana*, *M. × Ellisiana*, *M. × Stella*, *M. pulvinaris*, *M. Wageriana*, *M. cucullata*, *M. oethodes*, some very brilliant *M. amabilis*, &c.

Of the lesser species in the other house in bloom were the rare and pretty Masdevallia *O'Brieniana*, *M. gemmata*, *M. triaristella*, *M. simula*, *M. hieroglyphica*, *M. infracta purpurea*, and others of that class.

In the long *Cattleya*-house there was a good show of *Cattleya Mossiæ*, *C. M. Reineckiana*, *C. Mendeli*, and a magnificent dark variety of *Cattleya labiata*, the first to flower of a new importation.

Also in bloom in the intermediate-houses is a splendid lot of *Miltonia vexillaria* in perfect health, notwithstanding the fact that the protracted dull weather gave Mr. Chapman much anxiety about them, and some of the other species. In one house is a large batch of *Miltonia Roezli*, principally the pure white kind, and well furnished with its pretty rose-scented flowers; a healthy lot of *Vanda teres* in flower, and profusely-flowered *Dendrobium Dearei*.

The *Phalaenopsis*-house has a fine lot of plants in perfect health, some *P. amabilis* being in bloom. With them in flower or bud *Ceologyne pandurata*, *C. Dayana*, *Oncidium Papilio*, and *O. Krameri*, *Calanthe veratrifolia*, &c. And in the most perfect health a number of fine plants of *Bolleas* and *Pescatoreas*, including *P. Klabechorum*, *P. Lehmanni*, *P. Schroderiana*, &c. Another instance of what intelligent culture may do with delicate subjects.

Other remarkable things in the collection are a fine set of insectivorous plants, *Sarracenias*, *Droseras*, *Cephalotus*, &c.; a very healthy batch of *Disa grandiflora*, a pretty unheated low house filled with *Todeas*, in splendid condition; and in the other houses of remarkably well-flowered plants were the now rare yellow *Oncidium sessile*, a fine *Laelio-Cattleya × Schilleriana*, and a large number of *Cypripediums*, both species and hybrids.

The raising of hybrid Orchids, in which Mr. Chapman has been so successful, is being continued steadily, and many new kinds are approaching maturity, while thousands of small ones are coming on.

CATTLEYA MOSSIE AT MESSRS. HUGH LOW & CO.'S NURSERY.

This grand old Orchid is just now in excellent condition at the Bush Hill Park Nursery of Messrs. H. Low & Co., and a walk through the houses there gives the visitor an opportunity of feasting his eyes on a sight that is seldom met with, and that cannot be matched at the present time anywhere in the neighbourhood of the metropolis. The removal of the plants from Clapton, and the establishing of imported plants in the fresh and purer air, have become absolutely essential, and little more need be said than that the step was the right one, and that the results have justified the step.

Some flowers noted as we walked through are of the true old type, if such a statement may be permitted, that is, one's memory at the sight of many runs back to some flowers of earlier importations;

there are others, however, that seem quite fresh both in colour, markings, and general appearance. Among such I noticed the lovely *C. M. Arnoldiana* having pure white sepals and petals, the latter broad and of a very stout substance, the charm, however, being in the lip, which is of great width, the throat of a deep orange colour, with purple lines running well through it; the first part of the labellum is of deep purple, with deeper coloured streaks over the whole of it. A flower of great substance, measuring just 8 inches across. *C. M. Reineckiana* is in many respects similar, but having less purple in the labellum—still, a most lovely form. Other forms have deep coloured labellums, with yellow throat; with others the yellow prevails, and but little of the purple is present.

Among the thousands of flowers just now open, the most exacting could find forms to suit them; to attempt to describe them, however, is a task beyond ordinary powers, and would avail little. Of the *C. Mendeli*, it must also be said the blooms are of immense size and vigour, stout and broad in every segment. I have one now before me with most charming mauve-colour, sepals and petals perfect in every particular, the beauty of this one consists in the deep purple of the labellum, intensely dark on the lip, being carried right round the upper portion, so that the whole of this limb has a deep purple margin, which adds much to its beauty and distinction. Another form of great size and beauty, with a labellum of intense purple tint, sharply defined from the yellow throat, strikes one at once; but the great number is bewildering. One thing that struck me was the clean, healthy appearance of all the plants, the freedom of growth, the stout pseudo-bulbs, and leather-like looking leaves—plants which when out of flower are attractive and pleasing, full of roots, and always promising better things.

Among so many plants deserving of mention, I must allude to *Oncidium macranthum*; these have grown freely, bulbs of fine size and stout leaves, and are now full of their choice yellow and purple flowers. To my mind this is one of the most showy of all the *Oncidiums*, and if to keep and flower it year after year is a proof of excellent culture and attention, I have no fear of its continuing to prosper at Bush Hill. Of the *Odontoglossum crispum*, it is only just needful to say that many thousands of this lovely Orchid are in robust health, some of the specimen plants having bulbs of unusual size and plumpness. The spikes of bloom are, as might be expected, stout, numerous, and in every respect satisfactory. The middle of June is, however, rather too late to see these in all their freshness and beauty, and what one can note just now is but the end of the spring display; then the show during March, April, and May, must have been superb. Of two seedling *Cypripediums*, *C. l'Ansoni* and *Mrs. Reginald Young*, I say little. These, I anticipate, will be at the Drill Hall on Tuesday, the 27th, when they will come under the notice of the committee, whose opinion on their merits will, I venture to think, be a favourable one. As this nursery has so recently been described in your pages, it is not necessary again to mention the number and size of the houses, the immense quantity of plants so well done, and the additions constantly being made. I would, however, say, my visit gave me intense delight, filled me with surprise, but knowing well the earlier stages of the Orchid-culture at Clapton, I was led also to expect even greater things in days to come. *W. Swan.*

ORCHID PORTRAITS.

BRASSAVOLA DIGBYANA and LAELIO-CATTLEYA DIGBYANA. TRIANÆI, *Le Moniteur Horticole*, June 10.

The following plates are issued in the last number of the *Lindenia*—

CATASETUM SPLENDENS VAR. LANSBERGEANUM, sepals straw-coloured; petals white, thickly sprinkled with minute violet spots, apex acuminate rosy violet; lip yellow, flushed with brown, t. DCXI.

CATTLEYA TRIANÆI, VARS., t. DCXII.

CYPRIPEDIUM LEBRUNIANUM × L. Linden, apparently a natural hybrid between *C. Spicerianum* and *C. purpuratum* and sent to Brussels with a consignment of *Spicerianum*, t. DCXIII.

LÆLIO-CATTLEYA CHERIMETEFFIA X, L. Lind., sepals narrow; petals broad, spreading, pale violet, with deeper flush on the centre, base of lip convolute white, flushed with violet, anterior lobe broad, circular, undulate, rich violet with a white edge, t. DCXV.

LÆLIO-CATTLEYA HRUBYANA X, perianth segments violaceous, with a brownish streak; anterior lobe of lip spreading, rich rosy violet, t. DCX.

ODONTOGLOSSUM ADRIANÆ VAR. *CRAWSHAYANA*, a densely-spotted form, presumed to be a hybrid between *O. crispum* and *O. Hunnewellianum*, t. DCXIV.

ODONTOGLOSSUM CRISPUM VAR. *LEEMANNI*, a form with broad undulate white segments, all with large purplish-brown spots. Moortebeek, *Lindenla*, t. DCIX.

ODONTOGLOSSUM KRAMERI, Rehb. f., in *Gardeners' Chronicle*, 1868, p. 98; id. 1886, i., 756, t. DCXVI.

CARNATION SOUVENIR DE LA MALMAISON.

THIS well-known variety, certainly the best of the perpetual or Tree-Carnations, is fast claiming a large share of public favour; it would, however, be hard

the slightest trace of it, and I am inclined to congratulate myself on being victorious.

It would serve no purpose to enumerate the different antidotes, exterminators, &c., which I tried for nearly six years, many of which were accredited with highly curative properties, but which failed in each case, which failures led me to conclude that it was rather some detail in the treatment of the plants that was at fault, and my subsequent experience proved that in this I was right. I procured a stock of young layers, fairly clean, but not absolutely so; and I removed the affected parts, and adopted a system of treatment which I will now endeavour to explain, and if any of the many persons who have from time to time asked me questions concerning the cultivation of the Malmaison should read this note, I trust they will take it as an answer to their queries.

The procuring of a healthy stock should be the first consideration, and preferably young stock, and

brisker the circulation the better. Towards the autumn, winter-quarters should be selected for the plants, and this should be an airy cold glasshouse, preferably span-roofed. In this stand the plants near the glass, and maintain a dry temperature, admitting an abundance of air at all times, affording no more water than is actually necessary, and lessening the amount of it as the days shorten. A sharp look-out must be kept for the least trace of the dreaded fungus, and should it be found the removal of the affected parts should be immediately carried out. Greenfly is sometimes troublesome, but a mild fumigation at fortnightly intervals, using Richard's XL - All vaporiser, will keep this in check.

From the middle to the end of the month of January, root-action becomes more apparent, and a shift into 6-inch pots becomes a necessity. The potting-soil on this occasion should consist of two parts fibrous-loam, broken with the hand into pieces of the size of a Walnut, one par

FIG. 1.—A GROUP OF SOUVENIR DE LA MALMAISON CARNATIONS, AT DOVER HOUSE GARDENS, ROEHAMPTON.

to determine whether this popularity arises from the beauty of the flower, or to the difficulty experienced in the successful cultivation of the plant. However that may be, the fact remains that hundreds of gardeners throughout the country are engaged in growing "Malmaisons."

The chief obstacle met with in the cultivation of the plant is its liability to fall a victim to several minute funguses which, if not resolutely and persistently combated, soon disfigure, and ultimately ruin the plant. I remember the time when no such pest was known to me, when the *Souvenir de la Malmaison* Carnations were not thought much of, and the plants produced strong "grass" and huge flowers, which, like the poet's "modest wee flower," "were allowed to blush unseen."

My first acquaintance with the fungus was upon taking charge of Dover House gardens, where it was present, but in my ignorance of its ravages, I took no particular notice of it. I have since then had good reasons for remembering it, for until three years ago I have had to wage a constant war against it. I am happy to say that for the time mentioned I have not found

the present is a good time to look round and see where this may be obtained. I recommend young layers or plants, as they can be conveyed to a distance at less expense, are less costly in the first instance, and, besides having the pleasure of growing them, not much is lost should a plant die; whereas, if plants at 3s. 6d. and upwards are bought, the loss of one is a consideration. There exist various opinions as to whether layers upon being taken up should be placed in 3-inch or 6-inch flower-pots. I have produced good plants in both ways; but preferably I should recommend the former, especially to those about to begin the culture of the variety, as in this case there is less danger from affording too much water, a significant point in itself. Ample drainage is very essential; the soil should consist of two parts fibrous loam, one part leaf-mould, and half a part each of sharp sand and spent Mushroom-dung. When potted place the plants in a cold frame and keep close for a few days, no water being afforded at the roots till partial re-establishment has taken place. When that occurs air may be admitted, that is, in about a week from the date of potting; and the

peat similarly treated, with a half-part of sand and leaf-soil added, these forming the chief constituents of the soil, but, by way of adding porosity, a few pieces of charcoal with a sprinkling of ballast (burnt clay), and a 6-inch potful of Thomson's manure should be added to each wheelbarrow load of soil. The whole must be well mixed together before use. Press the soil well about the root-mass, but not making use of a rammer, which is not a safe implement in everyone's hands. These being now established plants, no coddling after repotting should be done; place a neat, green-painted stick to each plant, to which the main lead should be loosely tied, and given good weather, growth will quickly become more active, accompanied by a rapid growth of side-shoots; and these being the flower producers for next year should be well looked after, and as they grow up they should be slung up to the centre stick. It is well to thin out to the number of ten of these young shoots, which will be a sufficient number even in very strong plants. Remove all side-stem flowers as they appear, as it is better to have one really good flower than a number of puny ones. A greater quantity of water

will at that period have to be afforded, and once a week some weak manure-water will greatly benefit the plants; farm-yard liquid well diluted with soft rain-water, with as much soot added as will slightly colour the water, is a very safe stimulus.

Of late years we have, thanks to the efforts of Mr. Martin Smith, been treated to several varieties of sterling merit, which differ much in colouring from the older types, but in nearly all cases has the stout leathery foliage characteristic of the type been retained; in fact, in the case of the variety "Churchwarden," the grass is more robust than that of any Carnation known to me, while in habit it is all that could be desired, being compact, bushy, and eminently suited for low-pitched houses; Lady Grimston, Sir Evelyn Wood, Trumpeter, and Lord Rosebery might also be mentioned as being deserving of cultivation in the choicest collections. *J. F. McLeod, Roehampton.*

FLOWERING PLANTS UNDER TREES.

THE growing taste for planting flowers in an informal manner, and in parts of the garden distant from the flower-garden proper, renders the subject of planting under deciduous trees worthy of special mention. It is supposed that planting of this kind presents great difficulties, but these arise only when unsuitable plants are chosen, or the planting is performed in an unworkmanlike manner. It is not sufficient to plant weaklings from the bedding-out, or the refuse plants left over, and to merely scratch a shallow hole in the ground in which to stick them. On the contrary, the plants should be strong of their kind, and planted at the proper season; and though some plants succeed with very little preparation of the soil, others require a thorough loosening of the soil before the planting is performed.

Though flower plants will flourish in woods when not very dense, those which flower early, that is, before the leafage of the trees is complete, give the finest results. The shade of the Beech is proverbially inimical to any sort of undergrowth, still something may be done to clothe the ground beneath these trees. Nearly all of the plants mentioned in this note have been established for years in a grove of Beeches, where the trees are large-headed, and the shade dense enough to have killed all the grass that ever existed beneath them. It may be necessary to add that the lowest branches are a good height from the ground, and the plants therefore are not smothered by close shade.

I leave out Crocuses, which do well for a season or two, and then gradually disappear; and Daffodils, which do not flower freely unless the plants get a fair share of light, though the double *N. Telamonius* or *Von Sion* and the white-trumpeted *N. albicans* flower more or less freely most years.

First of all in season and in numbers comes the winter Aconite (*Eranthis hyemalis*) in countless thousands, covering large areas skirting the walk beneath the trees, and spreading far back from it and forming sheets of gold in winter. Then the Snowdrops, in lesser quantities certainly, but still plentiful enough for effectiveness, and before these have faded the blooms of *Anemone appennina* appear, grateful for the shelter provided by the overhanging branches; and then comes the almost equally attractive *A. ranunculoides* intermingled with it. It may be stated that the pheasant has a partiality for plucking off the buds of *A. appennina*, and does much harm some years. Unfortunately, neither *Anemone sylvestris* nor *A. nemorosa* thrive under the trees in our light and generally dry soil. Now, as I write in mid-May, the Wood Tulip (*T. sylvestris*) and the Primroses are passing, their places being taken with large groups of *Scilla nutans* and *S. campanulata*, both fine plants for light soils, each represented in three or four colours or shades of colours; the flesh-coloured form, *S. nutans*, makes a charming plant if planted in a group by itself. Other occupants of the woodland now in flower are the Forget-me-Not, *M. sylvestris*, which comes freely from seed sown on the surface of dug ground. Blue-eyed Mary, *Omphalodes*

verna, in its blue and white varieties, and big patches of Dog-tooth Violets coming in succession to patches of Sweet Violets. Both of the latter can be readily raised from seeds sown, like the *Myosotis*, when the seed is ripe. *Tulipa sylvestris*, it may be said, does better beneath the shade of trees than in the open, the flowers liking the shelter trees afford, and lasting longer. *Fritillarias* of species, including the Crown Imperial, do fairly well, but our land is too dry for them to make much increase, and the Crown Imperial does not flower, but the plants are conspicuous for their habit at a time when most of the undergrowth is low. Later on we get a fleeting purple tint throughout the grove from many hundreds of flower-spikes of *Campanula glomerata*, which lasts about ten days or a fortnight. *Alliums* in two or three species are interesting and bright; the St. John's-Wort, too, makes a capital undergrowth, but is a plant requiring to be kept within bounds, and not used in combination with other things. In the autumn huge corms of *Cyclamen neapolitanum* throw up hundreds of blossoms, to be succeeded by big cushions of marbled leaves. This plant should be used in the woodland as freely as Snowdrops, Primroses, and Winter Aconites, as it produces a wealth of flower at a time when flowers are getting scarce.

Under isolated specimens of the purple Beech, the native *Saxifraga granulata* forms a carpet of white, which contrasts effectively with the tender hue of the leaves of the Beech growing under great Cedars; the common Celandine is excellent, and Violets do well in similar positions. Under some Dog-wood (*Cornus sanguinea*) bushes growing on a bit of swampy ground, the pretty *Chrysosplenium alternifolium* makes an effective cushion of a golden hue, on which the red shoots and branches show up beautifully.

In addition to the native and other flowering plants I have named, there are a few others such as the *Veratrum*, *Helleborus foetidus*, Solomon's Seal, Turk's Cap Lilies, and hardy Arums, especially *italicum marmoratum*. *J. C. Tallack.*

FRENCH PEACHES.

IN the South of France the Peach grows very well in the open air, but in other regions it requires shelter on walls. The Peach is said to have been introduced into Europe from China (though no wild Peach has yet been discovered), where its culture was "venerated," and its luscious fruit held to possess the property of "eternalising life." It belongs to the Rosaceæ family. Persia also claims to be the original home of the plant—hence the name *Persica vulgaris*. Of the varieties, the name is legion, as it does not follow that the seed will reproduce the exact parental type, and new kinds are often raised in this way. There are more than 100 varieties in cultivation in France, but nurserymen limit the varieties they cultivate for sale to about a score. Even when pollination is most carefully carried out, it is found that a plant will not exactly reproduce itself. The flowers are hermaphrodite, and appear before the leaves.

In countries where the Peach-crop is plentiful, the fruit is distilled, and thus forms a profitable branch of industry. The earliest Peaches are ripe in June, and the latest may ripen even in November. Generally, cultivators of the Peach so choose varieties as to have a supply of fruit from the close of June till the end of October, and ten to fifteen selected of early and late varieties will be sufficient. Among the earliest used in France are:—The Amsden, Early Beatrice, Louise, and Alexander; then the Noblesse, Grosse Mignonne, Madeleine; and later the Galande, Belle de Paris, Reine des Vergers, Malta, Belle de Vitry, Desse Tardive, Salway, and Lord Palmerston.

The soil for Peach culture should not be too light or too heavy, but rich in lime. If the soil be heavy and moisture-holding, the Plum-stock is the best for worked plants; in other cases the Almond is more suitable as a stock, and on thin poor soils budding on the Apricot succeeds, as in the north of France. The nature of the soil has an important effect on the

quality of the fruit and the amount of the crop, as well as on the longevity of the tree. A Peach-tree may commence to bear fruit in the third year from the budding, and will continue doing so for five or six years, when decline sets in. The fruit of older trees is superior to that from young ones. If a soil be too humid or too warm, the fruit often falls before ripening, or what is nearly as bad, it acquires a bitter taste. A northern aspect is quite unsuited to the growth of Peaches, and a south-east aspect is the best; then east, south-west, and south. A western site is, in France, too much exposed to rain, and a southern one is too warm, for the Peach is capricious, and does not like sudden changes of temperature, or rapid alterations from sunshine to rain. This is the reason why Peach-trees are sheltered with screens, boards, glass, &c., from the month of February till the close of April, so as to shade them from the sun, and protect the bloom and the buds from damage by hail, snow, and frost. It is not the cold winter rains, but the spring frosts during flowering, that are dangerous. If a Peach-wall is to be erected, it should be carried to a height of 8 to 10 feet, and if not plastered, it should be faced with wooden lattice-work. The coping ought to consist of tiles, and it should project 5 to 6 inches.

The vitality of the seed of the Peach is not always certain; it disappears rapidly, hence it is customary to sow or at least pit the stones in the autumn, or store them in a cellar, or against a wall, covering them with earth or leaves. The layered stones are in April carefully removed and planted in rows in a nursery-bed at a distance of 20 to 30 inches apart, and the germ covered with soil to the depth of 3 inches.

During the first year the plant forms a long tap-root, and the stem attains a height of 2 to 3 feet. If trees are bought from a nursery they are not more than eighteen months old, straight, with well-ripened shoots and devoid of gum, and the lower shoots well developed. In planting stocks for wall Peaches the roots must be turned outwards from the wall. Budding time depends on soil, climate, and the state of the trees, but it is effected in the interval between the middle of the month of July and the middle of September. Though not a large tree—9 to 18 feet high—the Peach grows rapidly. At the commencement of every second or third winter the Peach-border, in which are the roots, is manured. At Montreuil, near Paris, which is devoted to the rearing and cultivation of Peaches, street-sweepings and horse-dung are the manures chiefly preferred; and in case of a soil that is light and warm, cow-dung replaces that of the horse. The coating of manure applied may measure from 2 to 3 inches in thickness. After the operation of pruning, tying, &c., the border is covered with straw, and it is never cropped with vegetables, and beyond an occasional hoeing to keep down weeds, nothing is done to it. The shoots of the Peach lend themselves readily to training, and hence the numerous fanciful forms cultivators give their trees. Let it be borne in mind that the tendency of the sap is to flow to the branches nearest the centre, and those that more or less approach an erect position.

The U, or as it is called, the vase form, is a favourite, as are also the palmette and the candelabra. The fan is a common form of training, and seven branches on each side of the centre can, in the course of a few years, be trained to cover a surface of forty square yards. In the vineyards of southern France, the rows of Peach-trees alternate with those of the Vine, and the precocious American varieties are in great favour there. No pruning is adopted save to remove the dead wood. The fruit on these low standards or bushes grows towards the tips of the branches. The fruits from such vineyard trees arrive in Paris at the close of the season, the costers selling them for stewing purposes at the rate of 20 centimes, or 2d., per pound. When the *Phylloxera vastatrix* destroyed the vineyards of France, many farmers planted Peach-trees, and those who did so have had no reason to regret it, although the Peach-trees do not live long. The oldest trees produce the best flavoured fruit, as has already been remarked, but great care must be given not to exhaust the

ree by over-cropping. The French gardener, like his English *confrère*, disbuds and thins the shoots of his wall-trees; and he finds it necessary, to give the desired colouring to the fruit, to remove the leaves that shade it some fifteen days before ripening. Peaches are removed with the fingers alone, and the fruit is placed in a small basket containing paper shavings or soft dry grass, or upon Vine-leaves deprived of their stalks, or on wool, the basket never having more than three layers of fruit. Before serving Peaches, it is usual to remove the down with a long soft-hair brush, and thus display the colour of the skin fully. When gathering fruit with a view to exportation, the Peach should be gathered a week or more before it is ripe, and enveloped first in tissue-

cover the incision with grafting-wax. If the roots be affected with parasitic fungus, the tree is dug up at once and burnt. For mildew on the shoots and leaves, flowers-of-sulphur is used; and tobacco-water-wash to clear off aphides.

The octroi-tax upon Peaches entering Paris is 1 franc per 2 cwt.; they mostly are the produce of La Crau, Estressin, Perpignan, and Isère. Brussels forwards excellent Peaches, both forced and from the open air, the latter coming from Hainault, where no Vines exist; she pays the same customs-dues as upon her Grapes, viz., 160 francs per 2 cwt.; if to this tax be added the expense of transport and local taxes, the total cost will amount to 207 francs. But the Peaches sell at 722 francs per 2 cwt. For

and 11 from Scotland; 19 gave no address on their papers.

Three hundred marks were allotted as a maximum, and all candidates who obtained 200 marks and upwards were placed in the first class. The total number was 87, or 45·7 per cent.

Those who received 150 and less than 200 marks were placed in the second class. The number was 61, or 32·6 per cent.

Those who obtained 100 and upwards were ranked in the third class. The number was 36, or 19·0 per cent.

The highest number of marks was awarded to Miss O. M. Harrison, of the Horticultural College, Swanley.

The great advantage of systematic training is seen in the fact that of the pupils, e.g. of the Swanley College, 24 were in the first class, and only 4 in the second. Of those of the Technical School of Stafford, there were 12 in the first and 7 in the second class; of the County School of Horticulture, Chelmsford, 8 were in the first class and 4 in the second; while of the Horticultural School, Holmes Chapel, Cheshire, 6 were in the first class and 4 in the second.

Comparing the results with those of last year, we find that the number in the first class has slightly decreased, viz. from 89 to 87. In the second class there is an increase from 55 to 61; and also in the third class from 28 to 36. Those not placed have fallen from 12 to 5. Comparing the percentages they stand as follows:—

	1897 (184).	1898 (190).
First class	48·3	45·7
Second class	29·8	32·6
Third class	15·2	19·0
Not classed	6·5	2·6

The answers were, on the whole, very satisfactorily given; and the general standard of those dealing with the Elementary Principles of Vegetable Physiology were somewhat better than was the case in 1897.

There is also a general improvement in the answers to questions referring to Practical Horticulture. Most of the students have a good general idea of the work, although a limited number only went fully into the minor details of it; but some of these details are essential to a full measure of success, and as far as possible they should be included in the answers.

GEORGE HENSLOW, }
JAS. DOUGLAS, } *Examiners.*

The questions set were as follows:—

Eight questions only to be answered: four from Division A and four from Division B.

DIVISION A.—ELEMENTARY PRINCIPLES.

1. Describe the methods of propagation of different weeds; explain why Groundsel and Chickweed and the large white-flowered Convolvulus are particularly troublesome. What are the best means of exterminating these plants?
2. Point out the importance to the plants of a good circulation of air in a hot-house, and the consequences of a stagnant condition of the atmosphere within it.
3. Describe the different functions of leaves, and the best way to secure their due performance.
4. What are the component parts of a flower, and of what use are they respectively to the plant?
5. What external conditions are favourable for inducing variations to appear in cultivated plants; and how would you proceed in order to fix any variation?
6. What parts of the flower are retained and altered in forming the fruit of the Peach, Melon, Mulberry, Fir-cone, and Pine-apple?
7. To what Natural Orders do the following trees belong:—Tulip-tree, Maple, Apricot, Ash, Laburnum, Gueldres-rose, Hornbeam, Thuia, and Evergreen Oak? Which are natives of this country?
8. Describe the structure of the bulb of the White Lily, the corm of Gladiolus, the creeping-stem of Couch-grass, the rhizome of the Flag, and the tuber of the Potato; and explain their uses to the plants.

DIVISION B.—PRACTICE.

9. Describe landscape-gardening as an art.
10. Describe the formation of a garden-lawn, and the details of the work necessary to keep it in condition during the year.
11. What are the preliminary operations necessary to the laying-out of a garden for fruit and vegetable culture? Describe the arrangement of the fruit-trees, and the method of planting them.
12. A garden having four walls facing north, south, east, and west, what varieties of fruit-trees should be planted on each? Describe their first year's pruning and training.
13. Give full details of the propagation and culture of Grape-vines and Fig-trees in pots.

FIG. 2.—BLUSH-COLOURED CARNATION SOUVENIR DE LA MALMAISON, AS GROWN AT DOVER HOUSE GARDENS, ROEHAMPTON. (SEE P. 3.)

paper, then in stronger paper, and lastly in soft, dry hay, or paper shavings or wood-wool, not more than two dozen being in a single layer in a deal box. Attention to these rules will prevent injury from shaking. Gather fruit in the morning, after the dew has disappeared; but never, if possible, when it rains.

The "gomme," or gumming, is the most serious disease from which the Peach-tree suffers, and the suddenness of the attack makes it all the more necessary to discover it in time. It is due to an excess of sap. It is not dangerous so long as it is confined to the small shoots; but when the fruit-bearing stems are affected, the loss of the tree may be feared. The gomme disease is recognised by the oozing out of a liquid-gum from spots on the bark, and the only course pursued is to cut off that portion of the branch, and

French-raised Peaches, the total cost of arriving at the Halles Centrales, or Central Markets of Paris, varies from 17 to 25 francs per 2 cwt., and the mean average selling price is 70 francs for the same weight. At Montreuil, the Peach suburb of Paris *par excellence*, the Peach-gardeners are wealthy, and their fruit is unquestionably the very best sent to the market. E. Conner.

EXAMINATION IN HORTICULTURE, 1898.

SUBJOINED is the Report of the Examiners of the Royal Horticultural Society for the year 1898:—

The Annual Examination in the Principles and Practice of Horticulture was held on April 6: 190 candidates presented themselves for examination. Of this number 155 were from all parts of England,

14. Describe the culture of Seakale, Asparagus, and French Beans; and the best method of forcing them.

15. What are the best manures for kitchen and fruit-gardens? How ought they to be applied, and when?

16. Describe the propagation and culture of Roses and Carnations intended to be cultivated under glass.

NOTICES OF BOOKS.

A TEXT BOOK OF BOTANY. By Dr. E. Strasburger, Dr. Fritz Noll, Dr. H. Schenk, and Dr. A. F. W. Schimper; translated from the German by H. C. Porter, Ph.D. (Macmillan & Co., 8vo, pp. 599, figs. 504.)

BRITISH and American students are under an obligation to Dr. Porter for his translation of this standard treatise. It is not intended for beginners, but for advanced students, and those who have need of a standard book embracing all or most of the newest discoveries and the most novel views. Morphology is studied so far as it can be phylogenetically, that is, from the ancestral or hereditary point of view, and "ontogenetically," or from the comparative study of the development and growth of existing individual plants. The former is, of course, mainly conjectural, the latter is actual.

Physiology—the action under various conditions, external and internal, of protoplasm—follows next in order. Purely physical influences, such as gravity, do not account for all the phenomena we witness, the shoot, like the ascending sap, ascends directly contrary to the influence of gravitation; the root, on the other hand, descends, and the root-stock creeps on the surface, though the physical conditions may be the same in each case. We can only suppose that the protoplasm is stimulated by light in the one case, by water in the others, to bend in the direction most beneficial at the time. To say that the movements are due to the forces of growth is to make an assertion, and leave it unsupported by evidence. Whether we admit a vital force or not, at any rate, all concur that living protoplasm is sensitive to impressions—is "irritable," as the technical phrase has it; whilst dead protoplasm is no more sensitive than any inorganic or dead substance.

The third section is devoted to "Special Botany," under which heading we have a general account of the present system of classification of plants, the arrangement followed being that of Alexander Braun, as modified by Eichler and Engler. The description of the several classes is given in a diffuse verbose style, which renders them dissertations not descriptions. This is not peculiar to this volume, but is general in modern German text-books, and copied faithfully in recent English ones. How we long, in perusing these long dissertations, for the descriptions of Linnæus without a superfluous word, and for the clear, definite statements of Lindley. The reader has to toil through a page or two—perhaps several pages—of detailed description before he can light upon any contrasting or definite statement which he can compare with others. Desirous, we will say, of knowing what Ferns are, and wherein they differ from allied orders, the reader has to read as many pages as his forefather would have had to peruse lines, to get at the required information. It is only fair to say that the present work is considerably clearer, and less wordy than many German books, and it has, as far as we can judge, been well translated. We find no mention of the discovery of spermatozoids in Cycas and in Ginkgo, so that we imagine the work was out of hand before this very important discovery was made known. As a text-book of the highest class, this work deserves, and will, we doubt not, obtain a place among the very foremost.

THE FLORA OF PERTHSHIRE. By Francis Buchanan W. White, M.D. . . . Edited by James W. H. Trail, A.M., M.D. (Printed for the Perthshire Society of Natural Science by William Blackwood & Sons.)

This is a book with an unfortunate history. The greater part was in manuscript before the death of

the author, but that manuscript was incomplete, and had not received the final revision of the writer. Professor Trail's task has therefore been no light one. He has received willing aid, which he is careful to acknowledge. Perthshire is one of the most interesting, botanically speaking, of all the counties, and a complete flora of it is a boon to local botanists and tourists. The report of an address on the origin of *The Flora of Perthshire*, by Dr. Buchanan White himself, forms an appropriate introduction to the volume; whilst the memoir will be read with much interest by those who only knew the author by name. It may be pertinent to suggest to local botanists that they should cast their eyes over the garden-wall and tell us what crops of fruit and vegetables are grown above certain levels, and what exotic trees thrive in the policies. A great deal of useful information as to local climate and its influence on vegetation might thus be obtained to supplement, and often, we doubt not, to illustrate that obtained from the wild plants. We note in passing that in many parts of Perthshire the flowers and Ivy are only fully developed in warm autumns. Possibly equally good results would arise from such investigations as are to be had from the minute study of "critical" plants. The significance of variations is no doubt all important, but when we find the "critics" holding discordant views, no two of them agreeing as to the limitations of the varieties of Water Buttercup, or brambles, for instance, it is allowable to ask whether a little more study of the variations and adaptation to environment noticed in plants under cultivation might not be desirable. It is curious to note that, while a large number of variations of *Hieracium*, *Rubus*, and other genera are mentioned, not a single variety or variation is specified in the case of the Lady Fern, scores of which are enumerated by the Fern lovers. They must surely occur in Perthshire.

ELEMENTARY BOTANY. By Percy Groom, M.A., F.L.S. (George Bell & Sons.)

The object of this little book is a good one—to awaken and improve the observant faculties, and to encourage sound deductions from what is observed. Instead of beginning with details that not one student in a hundred ever has, or can have, a chance of seeing for himself—details which must always be left for the expert to discover and correlate—the author of the present volume begins with what may be seen by any beginner with no more elaborate tools than a penknife and a pocket magnifying-glass.

Passing systematically from the simple to the more complex—from the root to the fruit—the author reviews the subject of vegetable morphology, and gives a brief summary of the main phenomena of vegetable physiology. The appendix of technical terms contains, we are told, some terms which are actually incorrect and misleading. This, we suppose, is the case with the *tigellum*, which is said to be used (by whom?) as a synonym of the word *plumule*.

A MANUAL OF AGRICULTURAL BOTANY, from the German of Dr. A. B. Frank; translated by John W. Paterson. (William Blackwood & Sons.)

In this little treatise the agricultural student is at once introduced into the mysteries of Schizophytes, Mesomycetes, Archegoniata, and such like, before he has been told how to distinguish between Barley and Rye, Swedes and Mangolds. In other words he is taught, of necessity, to rely on what other people have seen, rather than what he can see for himself. Knowledge is of little or no use unless the recipient is able to apply it. In the present work two pages at the most are devoted to the bacteria. It may be left to the reader to conjecture what amount of real knowledge can be conveyed to the agricultural student in so small a space, or how much a tyro could be expected to appreciate the extremely complex and obscure action of these infinitesimal creatures. For one who has already some knowledge of botany, and wishes to refresh his memory, this little book may be useful. It is illustrated with numerous woodcuts.

BRITISH ORCHIDS.

MR. A. D. Webster has published through Messrs. J. S. Virtue & Co., 26, Ivy Lane, a second edition of his work on this subject, to satisfy the demand for information on this most fascinating group of plants. Long before Darwin had turned his search-light on to the group, botanists were enamoured with it, and the search for and discovery, say of a bee Orchis, gave a joy not to be appreciated by the profane. In Kent, at any rate, Orchids are associated with many other distinct and interesting plants, so that the chalk downs and chalk woods of the county are sources of unspeakable delight to the harmless botanist.

Unsympathetic game-keepers are, however, a nuisance. Not only do they shoot rare birds, but they suspect innocent naturalists of crimes or procedures that never enter into their heads, and, indeed, of which in many instances they know absolutely nothing.

The text of Mr. Webster's book still requires revision; for instance, on p. 5, the name of one of the tribes is given as "Phrydeæ," an evident but none the less annoying oversight, as it is supposed to be an extract from Hooker's "Manual" (*sic*), whatever that may be. The illustrations, too, are unfortunately often of a piebald description, half black, half light, from imperfections in the process-blocks or in their preparation for the press. The cultural details are, in every case, worthy of careful consideration, and give the work its principal value, as may be judged by the following extract:—

"The Orchid-bed can be formed in a shady, quiet spot, where the various qualities of soil may be placed in a very small area, so that different species of similar requirements can grow in close proximity. The position and preparation of the bed will, however, require a little attention, and may be readily formed in any half-shady corner (constant sunshine is inimical to the growth of several Orchids) by digging into the ordinary garden soil (which we will suppose in most cases to be loam) a quantity of peat or leaf mould; this being a mixture suited to the wants of most species. In planting the tuberous or other roots, the requirements of each kind can, however, be readily attended to; it may be by adding lime or chalk to those requiring a calcareous soil, pure loam or leaf-mould where necessary, &c. Limestone blocks or boulders should, where obtainable, be half sunk in the bed in as natural a manner as possible, and against the sides of which those kinds requiring a calcareous soil may be planted with the best chance of success.

When forming this low rock-work, part of the bed should be raised above the general level of the surrounding ground, in order to meet the wants of those kinds requiring a dry soil and situation. The bed should also be carpeted with some low creeping plants, such as the Sedums, Arenarias, *Campanula hederacea*, *Linaria alpina*, or *Anagallis tenella*, all of which are not only ornamental, but preserve a cool moist surface by preventing the too speedy evaporation of moisture, a matter of much importance for the healthy development of the plants. When planting the tubers, these should not be placed at a greater depth than from 3 to 4 inches. A few species, notably *Epipactis latifolia*, the *Cephalantheras*, and one or two others having fibrous roots, are, however, exceptions to this rule, and may with advantage be placed at a depth of 6 inches in the ground; but for the various species of *Orchis*, *Habenaria*, *Ophrys*, &c., the above specified depth should never be exceeded.

Although the majority of British Orchids are found in a somewhat stiff soil, still, in my experience of them, when brought under cultivation a fair admixture of sand is highly beneficial to most species; indeed, I make it a rule when planting to surround the tuberous or other roots with a handful of rough grit or sand, which not only to a great extent prevents decay, but materially assists in the formation of roots. This precaution is all the more necessary when planting imported Orchids, the roots of which have become damaged in transit, or through carelessness in lifting."

LAYERING.

THE student of gardening desirous of discovering the origin or originator of the practice of layering, as it now exists, would doubtless have to seek for information in very remote ages. Nature herself set the example in many directions. We see it displayed liberally in Strawberries, in some Saxifrages, in various weeds, and in divers trees and shrubs. But so far as modern gardening is concerned, layering as a means of increased propagation, seems to be applied more in an artificial way than in a natural way by creating similar conditions to those produced by Nature, and deriving similar results. So profuse in natural layering is the Strawberry, that we have no reason to seek

for other methods of propagation. It more than serves all ordinary requirements; yet the Strawberry does not present quite the same aspect of layering that is found in other plants that have of necessity to be artificially treated. The Strawberry stolon produces a plant even before it does roots. No one probably has ever attempted, or even thought it worth while, attempting to induce the stolons of these plants to produce other rooted plants by making incisions into these connecting-strings, layering them into soil. Of all plants we grow in gardens, there are few on which we have to depend on layering for increase so much as the Carnation. This is particularly true of it, because it is practically everybody's flower. Yet, whether layering be applied to Rhododendrons or to Magnolias, to many similar things, as well as to trees, and, not least, to the propagation of various stocks for fruits, the principle is the same. Generally, it may be said that mere layering may be applied to them liberally, but no satisfactory results will happen unless the principle of tonguing the stems be practised. In burying stems of branches Nature often does much, but tonguing she does not, except

that the desired diversion of sap into it with the view of producing certain results may follow. Layering is not the only operation performed on plants with the object of increasing them, that naturally calls for thought and enquiry. The operation of cutting-making, so very common, and far more available for the purpose, though very much the same in all cases, is one that should command all the operator's intelligence. It is not enough to be able to do this work mechanically. It should be the aim of all to understand the physiological principles that govern it. A. D. [We may indicate a few kinds of plants which a gardener may increase at this season by layering big or little shoots and branches, viz., Vines, both ornamental-leaved and fruiting; Ivies of all kinds; Roses (not the monthly Roses readily), but especially those that make long, vigorous growths, such as the naturally climbing species and varieties; Loniceras with climbing habit; Rhododendrons hybridum, and the warm-house (Javan species and hybrids), the Alpine species and the more prostrate habited Himalayan species; Weigela sinensis; the Cotoneasters; Laurels of all species and varieties; the Ligustrums; the New Zealand Veronicas, Senecios

used to pack in Rhubarb leaves. All his goods were well grown and shown. Then there were three market-gardeners—the Atwoods—who used to grow Asparagus; and there were also Grayson, Hitchcock, Pocock, and Jessop; the last-named grower used to send very large quantities. I have seen his van loaded with bundles of Asparagus packed in the body, without any baskets being used, which I never knew any one else to do. He also produced very fine Onions and Parsnips—in fact, everything he grew was well done. Jessop used to pack his Asparagus in meadow-grass mown, no doubt, for the purpose; while Hitchcock, Grayson, Pocock, and some others packed in Rye-grass, which is a nice clean kind of packing, and I used to think that it made the Asparagus more attractive to customers. The bundling varied slightly from that now in use, and, I think I may safely say, that all bundles contained more heads than is now the case. Now, from what I have observed and read, I believe we have among British gardeners some of the best cultivators in the world, and I wish to bear record to this fact. Although in this and previous seasons large Asparagus—Giant, Victoria, or call it what you like, from abroad has realised considerably more, sometimes double the price of home-grown, it was for the simple reason that it was big, showing there is, with increased wealth of the community, a growing demand for Asparagus with big heads. Now I would ask, why cannot our own growers grow the vegetable to as large a size. It must be remembered that there are not 100 heads in a bundle of this big "grass," and, moreover, it is pale in colour, and is not, I suppose, exposed to sunshine, and may be the variety differs from that which we grow. [No; it is a matter of climate and of feeding with sewage. Ed.]

In conclusion, I feel certain if we grow it big enough, seeing what the demand now is, that we could command the trade. In the Evesham district I hear that the area under Asparagus is considerably extended, and it is estimated there are now four thousand acres under this crop, but the produce that I have seen is puny, and the market reports of the *Gardeners' Chronicle* show that it fetches inferior prices. T. P., June 25, 1898.

PACKING FRUIT FOR MARKET.

The growers in their methods of marketing fruit, we are pleased to see, are taking a step in the right direction. Strawberries are being marketed in fancy handle-baskets different to anything that has been seen before, and we trust they will be followed with other fruits that will allow of it throughout the season. Retailers of fruit know how much better fruit opens up the less it is handled, and also how much more attractive it is to the would-be purchaser. We trust, therefore, that the trade generally will take to this new method, which we have advocated from the first both as regards baskets and boxes. Packing selected fruit in small quantities and in such a form that they can be readily handled, although perhaps putting the grower to a little more trouble, is certainly more likely to bring better results all round. For this purpose there is still room for improvement in the make of both baskets and boxes for this purpose. The handle-baskets above referred to are coming from French senders; they are very light and serviceable. It can hardly be expected that anything suitable will be turned out from the English basket-makers' shops, considering the start the foreigner has got upon us, but wholesalers of this ware, who pay periodical visits to the various basket-making centres, might do much towards bringing about this improved method of marketing in small quantities, even if they had baskets made to their own design. *The Journal of Greengrocery, Fruit, and Flowers.*

STAPELIA LONGIDENS.

ON the occasion of the publication of Mr. N. E. Brown's description of this new species in our issue for September 21, 1895, we were unable to procure a figure of the flower. We are now enabled by the kindness of Mr. Eric D. Tillett, of St. Giles' Street, Norwich, to afford our readers an illustration of this singular looking plant (see fig. 3). The plant

FIG. 3.—STAPELIA LONGIDENS, GROWN BY E. D. TILLET, ESQ., NORWICH.

in a rough way, by abrasion. It is most likely that the earliest gardeners, who first adopted artificial means to the desired end, did observe the frequent rooting which followed up on the breaking of the bark of tree or shrub stems, resulting from abrasion, and from it came the practice of tonguing. The principle of this practice lies in the absolute necessity there is for a break, though it be but partial, in the bark, to check the sap-flow, which presumably passes through the cambium bark layer. The tonguing of any stem is invariably done by an upward cut or slit towards the leafage, and not in the reverse way. The latter would probably prove useless. The tongue soon calluses over, and develops roots. Very pretty work, too, is layering, not only because it is light, but it requires considerable deftness of hand and experience in manipulation to do it properly. Few operators, however, wooden generally, but know that their labours will come to nought if the cut surfaces of the layer close up and are so buried in the soil. The cambium layer that is inevitably formed on the wound in this case becomes a species of cement, uniting the severed portions again indissolubly, and no rooting follows. It is therefore indispensable that in placing the layer into the soil the tongue or slip of partially-severed stem be separated from the main stem, when so inserted,

and others; bush fruits, although this method is not to be recommended, the production of under-ground shoots and suckers being a great nuisance; Codlin and Burrknot Apples, and many of the climbing hard-wooded plants of the greenhouse and stove. Ed.]

MARKET GARDENING.

ASPARAGUS CULTURE ABOUT LONDON.

As the Asparagus season is now practically over, the following remarks may prove interesting to readers of the *Gardeners' Chronicle*. I think it will be admitted by all who know the market trade, that there is not half the quantity grown by the market-gardeners in the London district that was the case in the late fifties and early sixties; neither is the produce so fine now as then. Many causes have brought about this state of things, as, for instance, the increase of buildings in the suburbs, notably Brompton, Fulham, Battersea, and Wandsworth, where at that period splendid market-gardens existed, with unlimited manure within easy reach. I am now referring to the time when George Bagley, of Fulham, called "Gentleman Bagley," used to come and sell his own produce. He brought fine Asparagus, which he

was introduced from Delagoa Bay by Mrs. Monteiro, who sent flowers to Kew, and a plant flowered with Mr. W. H. Tillett of Norwich in October, 1892.

KEW NOTES.

CYPERUS FERTILIS.—This is an elegant basket-plant or the warm-house, several examples of it at Kew being noteworthy. It has lately been introduced from Old Calabar, where it grows abundantly. Judging by its growth at Kew, it is not a plant to introduce into a tropical country, as it might easily become a pest. It has bright green linear-lanceolate leaves, 6 inches long, and $\frac{3}{4}$ -inch wide, with a distinct keel and prominent nerves, which are coloured red at the base. Its white flower-spikes are borne on slender arching, and finally drooping stolons, which become about 2 feet long, and bear a cluster of plantlets at the end. These hang all round the plant in great profusion, ultimately dropping off, and starting on their own account. Like all sedges, this one enjoys a rich soil and plenty of water.

INCARVILLEA GRANDIFLORA.

A plant of this new introduction from China has lately flowered in the Cape-house at Kew. It is not unlike *I. Delavayi* in some characters, differing in its shorter leaves, more rounded leaflets, and short scape, bearing only one or two flowers, which are, however, as large as those of *I. Delavayi*, whilst the calyx-lobes are much narrower, and the corolla-lobes longer; the colour of the flowers is a rich rose-red. It is possible that *I. grandiflora* is only a form of *I. compacta*, also a native of China. For the discovery and introduction of this plant we are indebted to the expedition to Thibet and Western China by Prince Henry of Orleans in 1890. Another species of *Incarvillea*, found at the same time, has been named *I. lutea*, and is described as having yellow flowers as large as those of *I. Delavayi*. W. W.

SCHIZANTHUS.

WHEN plants of *Schizanthus* in variety are well grown, they make a magnificent show in the spring. The varieties which I have grown are *S. Grahami*, *S. Grahami carmineus*, *S. humilis*, *S. pinnatus albus*, *S. retusus*, and *S. retusus albus*, these being the showiest. The seed may be sown any time during the month of September in pans, in fine sandy soil, shaded, and placed in a cool frame. As soon as the plants are large enough they should be pricked off five or six in a 48-size pot; a 32-size pot serving for the next shift, and in this size they may be flowered, although if larger plants are required a shift into 16's may be afforded. A compost consisting of loam in a rough state, leaf-mould, and cow-dung, three parts of the former and one of the latter, should be used for the final potting, and the plants should be placed in the green-house. The stopping of the growths must be left to the grower's judgment, as it will depend on the size he wishes the plants to reach, and the time they are wanted in bloom. To insert three or four neat stakes placed at equal distances round the pots, and then to tie a piece of green twine at intervals round the stakes, is, for supporting the plants, the best way which I know.

Copious supplies of water at the roots are required at the flowering period, and frequent applications of weak manure-water improve the colours and invigorate the plants, and by keeping them shaded during bright sunshine the flowers last for a long period of time. R. N.

VEGETABLES.

DICKSON'S JUNE KING BROCCOLI.

I CONSIDER this a most valuable acquisition to our supply of late Broccolis, and this year, owing to the earliness of the season in Sussex, we have finished Late Queen and Veitch's Model Broccolis, but June King is just coming into use. The plant is dwarf, and the curd is compact and white. It is a variety that is sure to be extensively grown when better known. E. Burbury, Arundel Castle Gardens, May 30.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERRARD, Eastwell Park, Ashford.

Rosa rugosa alba.—This is an exceedingly pretty shrub for summer flowering, and the habit of the plant is good. When a plant of this species is well established, progress in size is rapid from its habit of throwing up suckers or shoots from the roots. The flowers are of a pure white, and if planted in quantity, especially when in proximity to the type, a very telling effect is afforded. A good soil, moderately manured, is that which suits *Rosa rugosa*; if the soil be made too rich with plant food the growths become too vigorous, and on the other hand a poor soil brings about a scraggy and stunted appearance. The fruits of the type and the variety are very ornamental.

General Remarks.—The rains have been beneficial to all the various kinds of plants in the flower garden. The borders of herbaceous perennials are gay with Delphiniums, Gaillardias, Lilies, Sweet Williams, Foxgloves, Pæonies, Pentstemons, Potentillas, Pyrethrums, Irises, and many other species of plants. Annuals in beds and borders will be fast coming into flower, as will the border Carnations. The subtropical garden, if not quite so dazzling to the eye, will soon be a source of interest to all who admire fine form in leaf and plant. And even the prim ribbon borders, where they still maintain their place, and the geometrically designed beds, with their Pelargoniums, Calceolarias, Begonias, Lobelias, and other plants, will be a source of enjoyment to others. Roses are in this part of England on the eve of opening. The presence of all this floral beauty gives the true gardener much to do and to think about. He can have no idle moment; what with staking, tying, thinning, pruning, removing spent flowers, &c., his hands are always full.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Woolverstone Park, Ipswich.

Salvias.—Late-struck plants of the autumn and winter-flowering varieties, if they are still in 4 and 5-inch pots, should now be put into pots in which they will remain till they flower, and for this purpose 7 or 8-inch pots are suitable, as when the roots are much restricted, growth is weak. As a compost, make use of good fibry loam, with a small portion of rotten manure, and sand in quantity sufficient to make it porous. When the roots have filled the pots, manure-water may be applied. If a plant is thin, let the points of the shoots be pinched, to induce a greater degree of bushiness.

Bouvardias.—These plants, if set out in a bed of light mould over a spent hot-bed without glass over them, make good late-flowering specimens; and they should be syringed daily when the weather is warm and dry. Any extra vigorous shoots should be stopped, and if the heads are crowded with shoots, some amount of thinning-out will be required. Bouvardias standing in their flowering-pots should be plunged outside in a warm sunny position, having been previously gradually hardened off. Late-struck plants should be pushed on rapidly, and when finally potted, they should occupy 5 or 6-inch pots. Let these last also be hardened-off, and placed outside about the middle of the month.

Achimenes.—These plants now growing freely will, if growing in flower-pots, require to be staked, or they will not have a good appearance. The stakes should be of a length suitable to the variety, neat in form, and painted green. If a particular variety needs to be increased, cuttings formed of the tips of the shoots may be inserted round the sides of a 5 inch pot, in a light sandy soil, and kept close and warm. Plants that have filled their pots with roots may be occasionally afforded weak manure-water.

Myrsiphyllum asparagoides (Smilax).—The last shift may now be afforded plants intended to be grown in flower-pots, and a 32 will be sufficiently large for plants raised this year from seed. Place them so that the growths may be trained on pieces of twine, or, failing this, neat stakes may be employed to support the bine, a very necessary practice if the growths are used in house or dinner-table decorations.

Decorative Trailing Plants.—Batches of cuttings of *Oplismenus Burmanni variegatus*, *Tradescantia*, and *Selaginella* should be struck at this date, to take the place of those that may have become shabby-looking, most of which may be thrown to the rubbish-heap. The cuttings should be inserted thickly, and placed

in a close, moist pit, shading them carefully for a time during bright weather.

Stove Plants for Conservatory or House Decoration should be carefully hardened off some days prior to their removal to the conservatory or house, as to remove stove-plants of any kind before gradually inuring them to a cooler temperature is always a cause of serious injury to them.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Currants and Gooseberries.—Bushes which are making growth freely, will be getting so crowded with shoots that it will become imperative to thin out the latter in order to let in light and air to the fruit. But whilst attending to this matter do not shorten the leading growths, nor those required for extending the crown or filling the gaps caused by loss of branches. Bear in mind to leave sufficient foliage to aid the fullest development of the fruits. As a rule of general application, it may be stated that the weaker shoots may be cut back to the base, and the stronger ones to three leaves of full size. Black Currants should receive no summer pruning in this way, the fruit being borne chiefly on wood of the preceding year.

Raspberries.—The whole of the young canes not should required to grow into fruit-bearers for next year be removed. Too often the Raspberry plantation is allowed to become a mass of root-suckers, starving the main stools and impoverishing the soil, forming a harbour for the fruit-eating and other birds, and hindering the due ripening of the fruits. It is a mistake to do nothing till the fruit is gathered, as is so often the rule in gardens. If young canes for forming plantations next year or this year are required, a sufficient number must be left, and at such distances from the old stools, that their removal in the autumn or spring may be effected without injury to the latter.

Out-door Vines.—These plants need frequent attention in the matter of securing the leaders to the wall, the removal of every weak or useless shoot, and the stopping of others at two joints beyond a bunch. If new rods are going to be laid-in in place of old ones, these should now be selected and trained at full length on a sunny, bare part of the wall. The side-growths coming from these young canes may be stopped at the first joint. Mildew in out-door Vines is often brought about by the dryness and impoverishment of the soil of the border, and it is a prudent course to afford water and diluted liquid-manure during the summer; and a dressing of Vine-manure is beneficial if afforded after the fruit is set. This applies more particularly to Vines in confined borders. Vines with unrestricted root-runs can scarcely be helped in this manner, their roots being as a rule far from home.

Plums.—If the trees of Denyer's Victoria and Rivers' Prolific planted against walls are too abundantly cropped, some rather severe thinning should be done, otherwise the fruit will be small in size, and lacking in flavour. Moreover, timely thinning favours the production of a fruit-crop the following season. The green fruits that are pulled off are of use in the kitchen, and need not be thrown away.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

Aërides japonica and Promenæa citrina are now flowering in the cool-house; these are two rarely-seen species of Orchids worth adding to any collection. The flower-spikes of the *Aërides* droop gracefully, and the blossoms possess a delicate fragrance. The plant should be grown in a small pan or basket, and have only crocks and sphagnum-moss in which to root. The *Promenæa* being of dwarf growth should also be cultivated similarly. During the summer let both plants be hung in a shady part of the cool-house, in winter removing them to a cool position in the intermediate-house, and keeping them always moist at the root.

Odontoglossum House.—At this season a few of the plants in this house will require repotting or re-surfacing, the more important of these being *Maxillaria Sanderiana*, *M. Hübschi*, *M. Amesiana*, *M. prestans*, *M. Augusta Victoria*, and *M. striata grandiflora*. These varieties are the better for being cultivated in baskets, for the reason that the flower-spikes frequently push forth in a downward direction, similar to *Stanhopea* and *Acineta*. *M. grandiflora*, *M. fucata*, *M. Harrisoniae*, *M. Houtteana*, *M. lepidota*, *M. luteo-alba*,

M. nigrescens, *M. picta*, *M. tenuifolia*, *M. venusta*, *M. meleagris*, *M. scurrilis*, *M. Lindenii*, *M. fractiflexa*, *M. mirabilis*, *M. porrecta*, and *M. elegantula*, may be cultivated successfully in an ordinary flower-pot. *Maxillarias* make plenty of roots and grow freely in a compost that consists of $\frac{2}{3}$ sphagnum-moss, $\frac{1}{3}$ peat, and a moderate quantity of clean crocks. Let the pot be filled up to two thirds of its depth with drainage material, and on this place the plant. After repotting apply water cautiously till roots push forth freely, when more may be afforded till the new growths are mature. All of the *Maxillarias* enumerated succeed when placed at the warmest part of the cool-house and afforded plenty of light, but not direct sunlight at any time.

Oncidiums.—The species *O. tigrinum*, *O. dichromum*, *O. excavatum* (aureum), *O. obryzatum*, *O. ornithorhynchum*, and *O. sessile*, may likewise require fresh material in some instances. Plants of *O. superbiens* and *O. loxense* now in flower should be kept moist at the root till the flower-spikes are cut, and then the quantity of water should be reduced, which will have the effect of inducing the plants to rest, which they may be allowed to do for a short time. They will break all the stronger for such rest.

Calanthe Veitchii, *C. bella*, *C. Burfordiense*, *C. Victoria Regina*, and the *vestita* section generally, now growing vigorously and getting well-rooted, should be afforded plenty of light, heat, and moisture, and occasionally weak cow-stall drainings. It is at this season that the plants should be examined occasionally, and where numbers of roots show on the surface of the compost, a thin layer of lumpy, fibrous-loam should be placed lightly over them, into which the roots quickly find their way, to the advantage of the plant. Keep the plants conveniently near the roof, and afford a humid atmosphere at all times, but avoid letting water lodge in the centres of the growths or axils of the leaves.

Eulophia guineensis (congoensis) and the pretty *Geodorum Augusti* require the same kind of treatment as the *Calanthes*.

Catasetum and *Cynoches*, now growing rapidly, should be afforded strong heat and a clear light at this season, and the best position for the plants will be found on the south-side of the East Indian-house, suspended close to the roof, with their foliage almost touching it. Afford water plentifully at the root till the new pseudo-bulbs are fully matured, and the leaves fallen. The flower-spikes generally appear just before the pseudo-bulbs are fully developed.

Habenaria rhodochila.—Plants that have ceased to flower may be placed in a light position near the roof in order to ripen the tubers. *Habenaria militaris*, *H. Susannae*, *H. carnea*, and its variety *nivosa*, if now growing freely will require much root moisture till the flowers show, and afterwards a less quantity will suffice. Watch the plants carefully for insects, or the beautiful foliage will soon become disfigured.

Miscellaneous.—Plants of *Platyclinis glumacea* may be removed from the East Indian-house to a cool intermediate-house, and growth being now finished less water is needed at the root. The leaves of the plants should be frequently syringed in order to keep them free from insects. *P. uncata* and *P. Cobbiana* will require the same kind of treatment till growth recommences. *P. filiformis* is fast sending up its thread-like flower-stems, and the plant will benefit from a daily over-head syringing till such time as the flowers open. This pretty species thrives best in the intermediate-house the whole year round. All of the *Thunias* should, as they go out of bloom, be placed in a less warm temperature by a few degrees than that of the East Indian-house, and where they may be gradually inured to the full light. They will require to be afforded water till the leaves begin to change to a yellow hue, from which time water should be withheld by degrees, and after the leaves have fallen not any water should be afforded. When at rest, place in a dry position, where the temperature does not fall below 55°.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

The Late-Bearing Peas.—The sowings of these varieties require a cool, deep soil, and an open sunny position. The round-seeded, early Peas not being so liable to attacks of mildew as the Marrowfats should be the ones sown. Let narrow trenches be prepared as for a row of Celery, or sow in well-trenched ground not recently manured with nitrogenous farmyard-dung. An endeavour should be made to keep the plants vigorous and green by frequent applications of

water in the dry weather, and dressings of artificial manure rich in potash.

Cauliflowers.—Those plants that were raised from seeds in May, and pricked out in nurse beds, will now be fit to plant out. They will form the latest supply of heads, and should be planted on a sunny open piece of ground in rows 18 inches apart, 12 inches between the plants, as they will not attain to the size of the earlier sowings. Plant with a trowel and make the soil firm about the ball, affording water in dry weather, keeping the soil stirred, and moulding up the stems when the plants are about 1 foot high, and generally following the directions given in earlier calendars.

Celery.—In some parts of the country it will have been necessary to afford water to the Celery-plants in the trenches, and as doing this causes the surface to cake, the hand-fork or hoe should be used to break it up slightly. And before proceeding to set out Celery, it is good practice to loosen the soil in the trenches in the same manner. The main Celery crop should now be planted in trenches at 9 inches apart; or if double rows are planted in a trench, they should stand at 12 inches by 9 inches. Assuming the plants were pricked out on nurse-beds, they should be lifted and planted with a trowel, so as not to damage the roots more than can be helped. And as regards the time to plant, a dull day following rain is the most suitable. Some gardeners sow thinly, and do not transplant, but lift the plants with a fork, trim the roots, and top the plants somewhat.

Brussels Sprouts, Savoy, and Borecole.—Advantage should be taken of showery weather to make good any vacancies in the beds and plantations, and to plant out the required numbers of the above.

Vegetable-Marrow and Cucumbers.—The early plants are now in bearing, and the bine will require regulating and thinning at short intervals of time, placing it regularly and evenly over the beds, pegging it down so as to keep it in place, and cause rooting at the points where it touches the soil, which will all add to the strength and vigour of the plants. The same rule holds good for plants of the pickling Cucumber. Afford each a frequent dewing over on hot afternoons with a syringe or a watering-pot.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

The Strawberry.—Continuing my remarks of last week on this subject, I would advise the gardener to determine the varieties he will force next season, and the number of each. Some varieties do better in some gardens than others when forced early, that is, for putting into the forcing-house in November and December. At Hatfield, that good Strawberry for early forcing, *Vicomtesse H. du Thury*, and also *La Grosse Sucrée*, are the best, and even for keeping up the supply till fruits are ripe out-of-doors. Other trustworthy varieties are *Royal Sovereign*, *Sir Charles Napier*, *President*, and *British Queen*. If one variety only is required, choose *Royal Sovereign*. The Strawberry is subject to infestation by mildew, which, should it appear on the old plants, from which runners are being taken for potting, it will spread to the young plants, checking growth very much. As a remedy, dissolve flowers-of-sulphur in water till it forms a thin paste, and then mix it with water at the rate of half-a-pint to two gallons of water. With this mixture let the plants be syringed from both sides of the row, doing this in fine weather. More than one application may be needed before the rooted runners are severed from the mother plants.

Melons.—The plants raised from seeds sown about a month ago should now be planted; and if a Melon-house is at command, and such a structure is always best for bringing a late crop of Melons to perfection, it should be thoroughly cleaned, and everything cleared out of it that is likely to breed fungus or afford a harbour for insects. Melon plants do not need more than 8 inches of soil, and this may be put on a hard floor overlying the water-pipes. For earlier fruiting plants, if the construction of the house will admit of it, a quantity of prepared stable-litter and tree-leaves is an advantage as a means of affording bottom-heat, is a saving of labour, and produces better flavoured fruit; moreover, a more shallow bed of soil is required. The best kind of soil for Melons is a stiff pasture loam one year in stack, which should be trodden or rammed firm when put on the bed. Let it get well warmed before the plants are put out. In pits where the Melon-plants are in flower, let the air be maintained of an uniform

degree of warmth of 68° to 70° by night, and 80° to 85° by day, with a bottom-heat of 80°. By keeping a high day temperature, the plants can be afforded freer ventilation at the setting time. At this particular period the plants should not be syringed overhead, but the moisture necessary to healthy growth in the plants can be afforded by damping the walls and bare parts of the Melon-bed. Plants in other stages of growth, whilst cool weather lasts, should be less frequently syringed. Melons grown in frames should be carefully looked after as regards the stopping of the shoots and fertilisation of the blossoms.

Cucumbers.—Let the spent bine and the older leaves be removed in small quantities from time to time, laying in new bine and pinching the points of laterals. If many roots appear at the surface, afford a 2 inch layer of soil and horse-manure. If winter Cucumbers are grown, a sowing of seed should now be made, in order to have plants for putting out in another structure, while the winter plants are coming into bearing. Cucumbers in frames require much the same kind of treatment as those in houses. The frames should be shut up early in the afternoon.

Tomatos.—When the stem reaches its limit, nip out the point and all the side-shoots, and keep them nipped off. Plants bearing a full crop of fruit may be afforded a dressing of loamy soil, mixed with old plaster, &c., enriched with an artificial manure. Plants for winter-cropping should be potted-off, and afterwards shaded from bright sunshine for a week or ten days.

THE APIARY.

By EXPERT.

Affording Honey Storing-space.—The first indication of bees needing room for honey-storing is when the top portions of the combs in the body-box become extended, as may be seen by the lighter colour of the wax employed by the bees in lengthening out the cells. This is an unfailing sign that honey is coming in, and that increased space must be afforded without delay. The ability to produce honey in quantity and in good form bespeaks the skilful bee-man, and such a one takes time by the forelock—has his supers ready to put on at a moment's notice, and no matter how long the inflow lasts, he is prepared for it. In fact, the loss of a couple of days may mean the loss of cwt. of honey, even in a moderate-sized apiary. In the year 1893 the inflow set in during the last week of May, at the rate of 6 lb. per hive per day. It, therefore, does not take much adding up to see what the loss to a bee-keeper owning a couple of score of colonies means at such a time. Supers were filled and ready for removal in three days, and unless others had been ready to take their places, see what the loss would have been. This happy condition may be our lot in 1898, and we should at any rate keep wide awake as to possibilities. We may be disappointed, but, bearing in mind that supers are not perishable, the worst that can happen is having to put them carefully away for another year. Remember the adage, "Store is no sore," and it is better to have stores and not need them than to need and be unable to get them. Having then decided what kind of surplus we intend to work for, let us prepare supers accordingly. If for extracted honey, fit the shallow frames with thin brood foundation. If for sections get the same fitted with full sheets of thin super foundation. To get bees to work well and quickly in surplus chambers—whether of shallow frames or sections—the main point is to prevent them from storing to any great extent in the brood-chamber. This latter should be reserved for the use of the queen, the main harvest being as nearly as possible all carried into the upper chambers. Any second crop may with advantage be left to go into the brood-chamber for winter stores. The natural position for stores intended for bee-food is above the brood, and with a little management the lower chamber can be filled with brood all through this month, after which time all stores must necessarily go into the chambers above. Under no circumstances should we allow the surplus to go below to the exclusion of brood, if we do that, there is little hope of remedying the defect before the honey flow is over. The immediate object to work for now is a strong stock of bees, and the whole body-box filled with brood; this object secured, the principal harvest will be stored in our supers. Wrap all supers up warmly, and see that they fit close down upon the brood-chamber. When the first super is three-parts filled, add another below, this leaves an empty space, and bees abhor a vacuum when honey is plentiful, and will at once set to work to fill it. A space between brood and stores tends to prevent swarming, and offers the bees an inducement to work harder than before.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR JULY.

SATURDAY, JULY 2	{ National Rose Exhibition at the Crystal Palace.
TUESDAY, JULY 5	{ Rose and Horticultural Shows at Hereford, Diss, and Harrow.
WEDNESDAY, JULY 6	{ County Borough of Hanley (Staffs) Horticultural Fête (2 days). Rose and Horticultural Shows at Farningham, Newton Stewart, Tunbridge Wells, Enfield, Redhill (Reigate), Chelmsford, Ealing, and Hitchin.
THURSDAY, JULY 7	—Rose Show at Woodbridge, Suffolk.
FRIDAY, JULY 8	—Ulverston Rose Show.
SATURDAY, JULY 9	{ Manchester Royal Botanic Society Rose Show. Wood Green and District Horticultural Society, Show. Royal Botanic Society, General Meeting. National Amateur Gardening Association, at Regent's Park.
TUESDAY, JULY 12	{ Royal Horticultural Society's Committee. Wolverhampton Horticultural Show (3 days).
WEDNESDAY, JULY 13	{ Durham, Northumberland, and Newcastle-on-Tyne Horticultural Show, at Newcastle (Deputation from the Royal Horticultural Society). Rose and Horticultural Shows at Nottingham (2 days), Bedford, Maidstone, and Ipswich.
THURSDAY, JULY 14	{ National Rose Society's Show at Halifax. Jersey Gardeners' Floral Fête. Floral Fête (Hospital) at Canterbury. Rose and Horticultural Shows at Salterhebble, Reading, and Brentwood.
SATURDAY, JULY 16	{ New Brighton Rose and Horticultural Show. Cardiff Horticultural Society's Show (2 days).
WEDNESDAY, JULY 20	{ National Carnation and Picotee Society's Show at the Crystal Palace.
THURSDAY, JULY 21	—Sidecup Rose Show.
SATURDAY, JULY 23	{ Royal Botanic Society, General Meeting. Redhill Carnation and Picotee Society's Show.
TUESDAY, JULY 26	{ Royal Horticultural Society's Committee. Tisbury Rose and Horticultural Show.
WEDNESDAY, JULY 27	{ Beckenham Horticultural Society, Show. Brightstone (Isle of Wight) Horticultural Show.
THURSDAY, JULY 28	—Bedale Rose and Horticultural Show.

SALES FOR THE ENSUING WEEK.

THURSDAY, JULY 2	{ Frechold Building Land at Malden, Essex, by Protheroe & Morris.
FRIDAY, JULY 8	{ Orchids and Palm-seeds, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63°1.

ACTUAL TEMPERATURES:—

LONDON.—June 29 (6 P.M.): Max., 74°; Min., 59°.
PROVINCES.—June 29 (6 P.M.): Max., 68°; Shields; Min., 56°; Sumburgh Head.
Dull; showery.

The Royal Horticultural Society's Fruit Show.

WHEN referring, on p. 360 of our last volume, to the recently-issued schedule of the September fruit show, we omitted to note an important regulation that appears upon one end of the entry forms, to the effect that the practice of advertising with what manure the fruit has been grown is prohibited. The Royal Horticultural Society has in many instances of late introduced very necessary improvements in connection with horticultural exhibitions, and though the present modification may be considered a small matter, it is by no means unimportant. Horticultural shows should be made pretty and attractive as possible, and as much by the elimination of unnecessary features that tend to mar the beauty of the display as by the introduction of novel and gratifying effects.

Those of us who are in the habit of visiting the exhibitions for the purpose of inspecting the plants and flowers to be found there, are only too sensible of the untasteful prominence given to advertisement cards. But of these the greatest objection is taken to the cards placed in very close proximity to first-prize collections, and suggesting, and sometimes actually asserting, that the produce has been grown by the aid of this or that manure. We need not discuss whether these are placed in such positions by the exhibitors themselves, or by their permission even. It is a fact that they are generally distributed subsequent to the prizes being awarded, and the visitor will seldom see one attached to other than a first-prize exhibit.

Without asserting that in many cases the exhibits may never have been given any of the particular manure so closely associated with them during their exhibition period, this much is quite certain, that the manure has played a secondary part in the production of the flowers, fruits, or vegetables. Is not the first prize in a competition a primary testimony to the skill of the cultivator? His attention to details, his knowledge of the plant's requirements, and his doing of necessary work at the proper time, all these are the chief factors in the successful cultivation of any plant, and were such a cultivator to substitute Mr. So-and-So's artificial manure for Mr. Somebody-else's preparation, the result would most likely be similar. Gardeners understand this, but the "man in the street," the large number of unprofessional cultivators who attend the shows, may be misled.

It is, therefore, most gratifying to note that the Royal Horticultural Society has decided that such practices in future will not be permitted at their fruit show. Certain other societies who are ever ambitious of acquiring a respectable reputation, would find it to their advantage to adopt a similar course in the matter.

We may add, also, that we have no sympathy with the custom of displaying cards advertising the fact that certain exhibits have resulted from the employment of seeds from a particular establishment. As in the other case, the credit is usually wholly due to the cultivator, who would not be likely to make use of inferior seeds.

ESCALLONIA LANGLEYENSIS × (fig. 4, p. 11).—This is a hybrid raised by Mr. SEDEN, at Messrs. VEITCH'S Nursery at Langley, between *E. macrantha*, which has relatively large pink flowers, and *E. Philippiana* (*Gardeners' Chronicle*, July 12, 1873, p. 947, *descript.*; and July 27, 1873, fig. 13), which has a profusion of small white flowers. The leaves of the hybrid are subsessile, linear,

oblong, tapering to both ends, and finely glandular serrate; the flowers are like those of *E. Philippiana*, but in colour a rosy-pink.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. C. J. INGRAM, secretary, desires us to inform our readers that the amount collected by Mr. J. JAKES for the Gardeners' Royal Benevolent Institution was £14 6s., not £7 10s., as stated.

MRS. WOODMAN.—We are glad to hear from Mr. NAPPER, whose devotion to his former employer is most touching, that Mrs. WOODMAN has been elected a pensioner of the Royal Masonic Benevolent Institution. It is pleasing to learn that the notices in the horticultural journals were important factors in producing this result.

GARDENERS' INVESTMENTS.—It was stated by the Treasurer at the recent dinner of the Gardeners' Royal Benevolent Institution that in one instance to which he referred, a gardener had subscribed sixteen years before he became a pensioner in 1866. He died in 1875, when the widow succeeded to the pension. Thus the husband received £144 from the Institution, and the widow £314, making a total of £458 received for an expenditure of £15 15s.!

GARDENERS' WAGES.—That these are often of the lowest amount, and utterly inadequate, we all know, but such low wages are not universal, or even general among the ten or twelve thousand men whose names occur in the garden year-books; and do not account for the painful want of proportion between those in receipt of adequate salaries and those who are contributors to the gardening charities.

GARDENERS' CHARITIES.—It is humiliating to have to beg in face of the figures which have been recently published to the effect that there are only 300 practical gardeners who contribute the annual mite required by the Orphan Fund, and of these only thirteen come from Scotland, in spite of the fact that eight of the children come from that country! How many *bona fide* gardeners in good places subscribe to the Gardeners' Benevolent?

FLOWER ON TENDRIL OF PASSION-FLOWER.—"Oakfield" obliges us with an interesting specimen of a flower produced on the tendril of a Passion-flower. Botanists have always been of opinion that the tendrils were modified flower-stalks, and the specimen sent by "Oakfield" confirms this in the most interesting manner.

A ROYAL VISIT TO MOORTEBEEK.—On Thursday, June 23, the King of the BELGIANS paid a visit to this well-known Orchid establishment, situated in the neighbourhood of Brussels. Under the guidance of Mr. LUCIEN LINDEN, the KING inspected for several hours the various houses and their treasures, and repeatedly expressed the deep interest he takes in horticulture, which plays such an important part in the industry of the country. His Majesty also complimented Mr. LUCIEN LINDEN on the model establishment he has erected, and continues to maintain in such a highly efficient manner.

LYONS.—The programme of the International Horticultural Exhibition to be held at Lyons from September 1 to 4, may be had on application to M. ANTOINE RIVOIRE, the President of the Committee, 16, Rue d'Algérie, Lyons. It is expected that Lyons will be the meeting place of all those distinguished in horticulture.

CAMPANULATE FOXGLOVES.—Several correspondents have favoured us with specimens this week. For some reason or other, the axis becomes arrested in its growth, and several of the topmost flowers run together and form a cup. The inner parts of the flower are generally more or less deformed, and no two are exactly alike.

NO. 3001.—This week we commence another millenary, so far as the weekly issue is concerned. Last week's number was the three thousandth weekly issue, and concluded the twenty-third volume of the third series. We are happy to state that the circulation is more than double what it was when we were younger!

CONFERENCE AT FLORENCE ON EARLY AND DELAYED MATURITY IN PLANTS.—We have received from the President of the Georgofili, or Royal Academy of Economy and Agriculture, particulars of

cultivated at lower latitude and at a lower altitude than those of the localities whence they were taken. Herbaceous plants, such as Wheat and other autumn-winter cereals ripen, on the contrary, later if the seed

under the same conditions of time and situation. On the contrary, different varieties from our country, Rieti Wheat, and red and white winter Wheat, are, in comparison, several days in advance of local varieties when cultivated in regions situated at an altitude higher than that of their original habitat; also, these varieties are renowned and sought after either in the north of Italy or in France, thanks to their early maturity, which renders them less subject to diseases, and especially to the attacks of rust. This difference in the vegetation of woody and herbaceous plants offers a problem not yet satisfactorily solved, based on the study of vegetable physiology and field meteorology; therefore, the Academy has offered a prize for a paper detailing the results of studies and experiments explanatory of the precocious or belated development of certain organs of field-crops when these are cultivated in localities where latitude and altitude differ from those of their original habitat." The competition is to be international; a Diploma with a Silver Medal, and a prize of 1200f. = £48, are offered to the author of the best monograph on the subject proposed. •Papers are to be written in Italian or French, and must be sent in to the Academy by June 30, 1900, and the award will be announced at the chief public meeting of the Academic year, 1900. The Secretary of the Academy is Signor A. FRANCHETTI, Florence.

LITERATURE OF FUNGOUS DISEASES.—Mr. W. C. STURGIS contributes to the Twenty-first Annual Report of the Connecticut Agricultural Station (New Haven, Conn.), a valuable list of the publications relating to plant diseases, issued by the U. S. Department of Agriculture and the several experiment stations during the ten years, 1887-1897, inclusive. The list will be so valuable that we may express the hope that it will be circulated separately. The author has adopted popular names where they are not misleading, and has endeavoured to systematise them thus, black-knot, black-rot, rust, leaf-blight, leaf-spot, stem-rot, mildew, leaf-scab.

ROSARIAN SOCIETY'S EXHIBITION AT LYONS.—We have received intimation concerning the second Conference of the French Society of Rosarians, which will be held at Lyons on September 2 and 3, on the occasion of the Concours Régional and the Horticultural Exhibition. The following subjects are proposed by the Society for discussion:—1st. The Classification of Roses; 2nd. Different Stocks and their Value; 3rd. Diseases of Roses, and Remedies to be applied; 4th. Synonymy in Roses; 5th. Forcing Roses, and the best Varieties for Forcing; 6th. The best Varieties of Roses for Cut Flowers; 7th. The Pruning of Roses; 8th. Use of different Manures in Rose-culture. Those who desire to deal with one or more of these questions, should send in their papers to the Secretary (M. OCTAVE MEYRAN) before August 15. The Exhibition at Lyons promises to be the most successful hitherto held, and promise of support is already assured from many horticultural and amateur growers.

A FERN-FROND SCREEN.—We have received from Mr. H. T. MARTIN, particulars of a four-fold screen 4 feet high, the leaves of which are ornamented on both sides with dried Fern-fronds. This style of decoration requires considerable time and patience to execute neatly, and our correspondent has evidently taken great pains with his work. The special interest attaching to this screen lies in the fact that the eighty pieces of different exotic Ferns and Mosses stuck upon it were grown or collected by Mr. MARTIN himself, and thus the charm of association is for him added to that of mere beauty of form and arrangement.

VIOLETS.—Mr. A. L. WINTON gives the following details relating to Violets:—One thousand plants contained in pounds, 257 lb. of water, 52 of organic and volatile matters, 7 of other mineral matter = 316. Of nitrogen, the quantity works out at 1.5; potash, 1.74; soda, .55; lime, .62; magnesia, .25; phosphoric acid, .37; sulphuric acid, .32; chlorine .27; other matters, 2.76 = 6.88.

FIG. 4.—ESCALLONIA LANGLEYENSIS: FLOWERS PINK. HORT. VEITCH. (SEE P. 10.)

a Congress to be held next year at Florence to consider the subject of advanced or delayed maturity in certain plants under varying conditions. Thus, some fruits, the Vine among others, ripen earlier when

comes from a locality higher both as to latitude and altitude. It sometimes occurs that certain varieties of foreign W heats from France, England and Germany ripen later than local Italian varieties, when cultivated

HOME CORRESPONDENCE.

THE GARDENING CHARITIES.—In your issue for June 18, your correspondent, Thomas Fletcher, commences his letter with a reference, as I suppose, to the Gardeners' Orphan Fund. He then proceeds to arraign the various insurance companies, calling into question their expenditure and general utility, and finally concludes by referring, as I imagine, to the Gardeners' Royal Benevolent Institution. It is in connection with this last-named charity that I venture to trespass on your space with a few brief remarks. When speaking at the festival dinner in aid of the funds of this institution on the 8th inst., I mentioned that it seemed to me that criticism in the horticultural press had worn itself out, but it seems I was mistaken; it has very little ground to stand upon if it endeavours to still sustain the fallacy that the gardeners who subscribe have no advantages over those who do not do so, the last remnant of which had been swept away, mainly owing to the splendid idea of Mr. Harry J. Veitch, the originator of the "Victorian Era Fund," established last year to commemorate Her Majesty's Diamond Jubilee, and which is devoted exclusively to the benefit of unsuccessful candidates, who have been subscribers, or the widows of subscribers. As soon, therefore, as a candidate, who has been a subscriber, or the widow of a subscriber, has satisfied the committee that he or she is a necessitous, deserving, and eligible person for a pension, such candidate is certain to be either elected a pensioner, or to receive benefit from this fund in proportion to the number of years of subscription. This is at once conclusive evidence of the advantages to subscribing gardeners should they unfortunately need assistance in their old age and time of need. Mr. Thomas Fletcher says that the "principle" on which the gardening charities are carried out is utterly wrong, but I fear he knows nothing of the "principle" of the Gardeners' Royal Benevolent Institution, at any rate, or of the Gardeners' Orphan Fund for the matter of that. Perhaps he will be surprised to learn that the former institution pays out to gardeners in pensions aggregately nearly five times as much as it receives from gardeners, although I am delighted to know that the gardeners who are making themselves acquainted with the institution and its work, are numbering themselves amongst its subscribers, and are doing all they can to further its progress and enlarge its usefulness. Besides which, out of thirty-six members of its Committee of Management, twelve are practical gardeners who may be supposed to have some knowledge at least of the "principle" which governs its operations, and I rejoice to know that these with many of their fellows, are doing their level best to support an Institution which is helping 168 poor old people to end their days in comparative comfort and without anxiety, as well as others not yet elected. I cannot think, therefore, that your correspondent voices the opinions of the majority of the gardeners, who in regard to the Institution could have no ground of complaint as to the benefits to be derived from its funds in cases of necessity and misfortune; and it must be borne in mind that four-fifths of its income are derived from the generous members of the nursery, seed, and allied trades as well as the benevolent public who take an interest in gardening, and who contribute, not for their own benefit, but for that of the gardener and his widow in their declining years. No public man of unimpeachable honesty and integrity ever fears criticism, neither does a well-managed institution, but in justice to a charity like the Gardeners' Royal Benevolent Institution which has existed sixty years, your critic should first thoroughly acquaint himself with the "principle" on which it is carried out before he makes the assertion that it is "utterly wrong." *George Monro, Covent Garden Market.*

A WASH AND BRUSH-UP AT SHOWS.—Now that the various horticultural societies are making their show arrangements, and in connection with your correspondent's suggestion for the earlier closing on the last day, I should like to suggest another boon for exhibitors. Would it not be possible for the larger societies to provide a small tent where a wash and brush-up could be obtained at a small charge? We are often so pressed for time after staging, as to be unable to get to our hotel and back before the show opens; and I feel sure that such accommodation would be greatly appreciated by exhibitors generally, including *Ernest J. Davis*. [May we suggest that a supply of clean towels is a great want at the Drill Hall, Ed.]

PRIMULA TRILH.—It is gratifying to find Mr. G. F. Wilson acknowledging that this supposed new species is simply *P. involucrata* under a new name. The result fully justifies the position taken by a small minority of the Floral Committee who objected to the creation of a new species upon such exceedingly vague information, and who also contended that Mr. Wilson's *Primula* was simply *P. involucrata*. What the Floral Committee, who are responsible for the new name, will be disposed to do in the matter, I cannot say, but I should think their obvious course is to withdraw both the name and the award. It may be a reproduction of Captain Munro's form of *P. involucrata*, which in all probability has become lost, for notwithstanding I have obtained this *Primula* under the names of *involucrata* and *Munroi*, I have always been unable to detect any difference between them. *R. Dean.*

LEAFAGE OF THE ASH-TREE IN THE NORTH.—The Ash and the Walnut mostly bring up the rear among our deciduous trees. I noticed, however, yesterday (June 20), several Ash-trees in fair and full leafage in and around Edinburgh. Considering the handsome appearance of the Ash in all its stages, flowering, foliage, and keys or seeds, it is surprising it is so little planted, either for use or ornament. In parks or pleasure-grounds we often find twenty, thirty, fifty Elms for one Ash. Even the lateness of its leafage should be a merit in many positions. For while Limes and Sycamores are approaching the sere and yellow leaf, the Ash clothes itself with its long robes of drooping green, very distinct and beautiful, whether at rest or in motion. *D. T. F.*

MANCHESTER AND NORTH OF ENGLAND ORCHID SOCIETY AND ITS AWARDS.—For an ordinary individual to attempt to criticise such an august assembly may appear somewhat presumptuous, but as a close observer of all reports relative to their meetings, and a conscientious well-wisher for the success of such a society, it is to be hoped that my remarks may be received in the spirit in which they are written. In the *Gardeners' Chronicle* of June 25, reporting the last meeting of the above Society, I note a First-class Certificate was awarded to a *Zygopetalum* "species." Had this particular plant been given a varietal name, no exception theoretically could have been raised; but I venture to ask, what is to prevent this very same plant being again exhibited by its present or ultimate owner, as *Zygopetalum* so-and-so, and awarded again a First-class Certificate, or the lesser Award? The committee could not technically say that *Zygopetalum* so-and-so had been previously recognised. The height of ambition in an Orchid connoisseur is to receive a First-class Certificate for any of his pets; and I respectfully contend that no plant should receive this much-coveted Award from any deliberating body, excepting it is properly designated and recorded, so that there is no possible chance of throwing away the distinction F.C.C. *Cattleya Mossii Rappartiana* was also favoured with F.C.C. How many more times? This is the second, if not the third, time the Society has so honoured it. Does not the sole value of such an honour lie in its uniqueness? and which in "ye old times" was considered by the possessor to be valuable, and with pride he looked forward to the increasing value of his plant. Alas! how things are changing, when on each consecutive season resemblances to a variety crop up, and they are in turn given honours equal in value to the typical and original. The Society presumably is wealthy, and why should it not, therefore, appoint a salaried secretary, one who is conversant with Orchids, experienced as a cultivator of them, who should assist the committee in making their awards by having matters pertinent to the exhibit in readiness for the meeting? Whatever is done, it is not advisable purposely to increase the difficulties of Orchid nomenclature by making indiscriminate awards. *I. I.*

THE STRAWBERRY-CROP.—How late good ripe Strawberries are in coming into the market! Practically there are, or will be, few up to the end of June. Commonly we have had them abundant by the middle of the month. I hear from the Swanley district that the fruits swell very slowly. I observed in one huge breadth just opposite Mr. Cannell's residence, that so late as June 21, strawing was then proceeding, the variety being Sir J. Paxton. Curiously enough, too, the oat-straw used was imported. Does that indicate that the war has sent up the price of straw as well as of corn? The bloom everywhere indicated a very heavy crop. Those gardeners who kept a good stock of plants in pots late, must have found them to be most valuable in helping to fill up that void created by the delay of out-door fruits to ripen. The showers

now falling may help the plants and fruits materially, but they are accompanied by cold winds, and if continued may conduce to mildew rather than to colour. *A. D.*

THE NATIONAL DAHLIA SOCIETY.—Permit me to correct a small error found in one of your answers to correspondents at p. 400 in previous issue, relating to this society. The secretary (honorary) now is Mr. J. F. Hudson, M.A., son of Mr. James Hudson, of Gunnersbury House Gardens, to which address all communications to Mr. J. F. Hudson should be sent. Mr. Girdlestone is now the President. Mr. Hudson, whilst actively engaged in academic work at Oxford, finds particular enjoyment in carrying out the duties of secretary during his periods of vacation, and is also an attached admirer of the Dahlia. The society is very fortunate in its officers and committee, as well as in its place for shows, as all are devoid of those unpleasant amenities which have of late made another society unfortunately notorious. Long may the National Dahlia Society and its beautiful Crystal Palace Show in September continue to enjoy those appropriate and refining associations which are making them so popular in the community. *A. D.*

THE COLD SNAP.—On June 15 at Newton Hall, Rillington, Yorkshire, our thermometer, standing at 3 feet from the ground, registered 7° of frost, and Royal Ashleaf Potatoes were badly injured in some parts of the garden, whilst others had not a leaf blackened. May Duke Cherries were badly injured on the exposed side of the fruit, as were late Strawberry blooms, but happily the bulk of the fruit was set, and is now safe. *James Elworthy.*

VITALITY OF HEVEA-SEEDS.—The several species of Hevea known to yield commercial caoutchouc are natives of Brazil and Guiana. Their seeds are now in great demand, but there appears to be some difficulty in obtaining them fresh. Some of the seeds received here are too old to grow, having, probably, laid under the trees for months before they were collected. If the seeds are collected as they fall from the trees, and packed dry in wooden boxes, they will retain their vitality for several months. They have been sent to Kew from Guiana, Trinidad, and Ceylon in bags or small wooden boxes, and nearly every seed thus sent has germinated. Last year a consignment of seeds reached Kew in a partially germinated condition owing to their having been packed in moist soil. They were accordingly planted thickly in boxes, and when about a foot high, the boxes were fixed inside Wardian-cases, and despatched on long journeys with success. A large importer of these seeds found it a good plan to sow them in boxes, and when the seedlings were a foot high to cut them down to about 6 inches; this treatment made them sturdy and better able to support a long sea-voyage; it also reduced the space they needed, flat-topped, shallow boxes with glass lids sufficing for them. The seeds require a tropical temperature and plenty of moisture to induce them to germinate. Briefly, the directions I would give for the importation of seeds of Hevea are: 1. See that the seeds are collected immediately after they fall from the trees; 2. Pack the seeds dry in wooden-boxes or bags if intended for long transport; 3. Sow the seeds in a high temperature, and give them plenty of water; 4. Seedlings should be sturdy and about a year old if intended for a long journey in a Wardian-case. *W. W.*

THE OAK-CATERPILLAR.—The replies to my letter respecting the Oak-caterpillar, have induced me to venture on one more. First, as to Mr. Forbes' consoling statement that no permanent injury need be feared; with the greatest respect to his opinion, I have positive proof that repeated attacks of the caterpillar do kill the Oak, as this occurred in Hopmas Wood, near Tamworth. I saw the trees. Many of the Oaks here are dead in the tops, and they are comparatively young trees, i.e., about 120 years old. From observation I am pretty sure this is caused by the destruction in successive years of the crop of leaves. But now for another subject, viz., that of bird preservation, the point suggested by "R. M., Newbury." The rooks have this year scarcely left the Oak-trees, and have been observed particularly active in the infested branches. I do not find nearly as many caterpillars on the infested branches of young trees within my reach, and as yet have seen few moths. A gentleman well acquainted with the subject, informed me last week, that after two attacks of caterpillar in the woods at Belvoir, the rooks came down and completely cleared out the insects. Now the rooks have greatly diminished near here. In rook-shooting time, the breech-loader does its work too

well. The inference I draw from what I can learn is, to give the rooks a jubilee, and encourage bird-life as much as possible. I have always been a friend to the birds, and I really believe the destruction of white owls, king-fishers, rooks, starlings, and all insect-eating birds to be about as great an act of folly as the farmer, gardener, or game-keeper can be guilty of. If any further facts respecting the Oak-caterpillar appear, I should only be too happy to either read or communicate them. *T. J. Levett.*

HEUCHERA SANGUINEA.—Complaints are frequently made about the scarcity of flowers on this plant, which I think may be due to lack of frequent removal into rich soil. At Belvoir I have found that the plant soon becomes weak and exhausted if this be not performed. Sometimes, too, it suffers from late spring frosts; but I have never seen it flower so freely as in the garden at Belton House, and on inquiring the cause I was informed the plants were raised from seed two years ago, but they had received no special kind of treatment, and yet were a mass of flowering-spikes, although many of these had been removed. The colour of the Belton flowers varied slightly from the type, and from each other, one plant being of a quite rosy hue. *W. H. Divers.*

VIOLA DUCHESS OF SUTHERLAND.—This variety has flowered remarkably well at Belton House Gardens lately, and Mr. Emmerton speaks very highly of it as a bedding variety. Its colour is a pleasing shade of lavender, the flower is of moderate size, and the habit of the plant compact and neat. *W. H. Divers.*

VAPORISATION WITH XL-ALL.—A correspondent signing himself "B. W." writes in these columns on June 25 for information in regard to vaporising Grapes with XL-All liquid, and I will give my experience for his and others' benefit. I used the vapour on Muscat of Alexandria Grapes two years ago when stoning was nearly finished, the night was followed by two very bright days which scorched the foliage up, but the berries did not suffer at all, neither in appearance or flavour. I did not like undertaking the operation, but thought the vaporiser might as well kill the thrip (which it did thoroughly), as the thrip injure both foliage and berries, but I think if they had been shaded from the bright sun for a day or two afterwards, no more than just the younger leaves would have been injured. The same Vines carried a good crop of fruit last year, and there is a good one on them now. The directions accompanying the stuff say, "Do not vaporise Alicantes or Muscats." In the same house I have Alicante, Gros Colmar, and Gros Maroc, and these Vines were scarcely injured at all. I have never tried it on Black Hamburgh or any other Vines, except those mentioned; but I prefer it to anything else in the way of insect destroyers for general use. No Maiden-hair Fern can put up with it. I have not found it to injure any other plant or flower. *A. J. Nightingale, Redlands Gardens, Northampton.*

A HAILSTORM AT LAMPORT, NORTHAMPTON.—A fearful storm passed over Lamport on Saturday, June 25. The weather was very threatening all day, thundering and lightning, and about 4.30 it commenced to rain, and was followed by hail and snow chiefly, hail that came down so fast that it blocked the drains in the kitchen gardens and pleasure-grounds; the lawns, and the borders, and the kitchen garden were covered with snow and hail to a depth of 1½ inches, breaking off nearly all the leaders of the Scarlet Runner Beans, and the early Strawberries knocked about a good deal, but at present I cannot detect any very serious damage. The thermometer fell to 37° Fahr., but only for a very little while, and then it remained stationary for about an hour and a half at 42°. The rectory garden suffered very much, Potatoes being stripped of their leaves, Parsnips and Strawberry crops quite spoilt, and the majority of the blooms were knocked off the summer bedding plants; in our agent's garden great damage was done generally. The hail and snow had to be removed from his front-door with wheelbarrow and shovel. The storm was quite local, as at the railway station no hail had fallen, and very little rain; and at the next village, about 1½ mile distant, they were cutting hay all the afternoon. The storm came from the south-west. *H. Kempshall.*

CRATEGUS OXYACANTHA VAR. HORRIDA, Hort.

When recently visiting the Belgian State School of Horticulture at Vilvorde, Mr. F. W. Burbidge and

myself were shown an extremely interesting form of the common Thorn, distinguished by an excessive development of spines. It was called var. spinosissimus, but this in the Hand-list of trees and shrubs grown in the Kew Arboretum is given as a synonym of var. horrida, Hort., which name, therefore, is the best to adopt. The accompanying illustration (fig. 5) was kindly drawn by Mr. F. W. Burbidge, and grafts brought home will probably grow in the Cambridge Botanic Garden. The kindly way in which trimmings are kept at Vilvorde for those who may wish to use them as grafts, is worthy of remark; they are heeled-in at the foot of the tree to which they belong, and those who wish may have them. *R. I. L.*

FIG. 5.—CRATEGUS OXYACANTHA VAR. HORRIDA.

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 22.—The Rev. Professor Henslow's second lecture, given again in the Great Vinery on the above date, with Mr. Marshall presiding, secured a very large attendance, fully eighty persons, chiefly young men, and the new lady students, being present. The subject was the interesting one of the "Origin of some Vegetables," a large amount of useful information being furnished that should greatly assist those present in their vocation. So much outside of the ordinary rack of garden knowledge is the information thus furnished in the course of four lectures, it seems almost a pity that a series of questions on points dealt with, and on matters of special garden interest, could not finally be set, and an examination held of the students present, to test their interest and retentiveness. Mr. Henslow, at the outset, regretted that there were no really new vegetables coming

into use. All that did so were but of the old orders or families. He knew of a few plants that he thought might be improved into useful edible vegetables, but these were not the subject of his observations. The extensive Brassica family was first noticed, and examples of the native species shown. The probable origin of many of the best known sections was discussed, lucidly, and free from dogmatism. Root plants, such as Turnips, Radishes, Parsnips, and Carrots, were freely adverted to. The story of the origin of the Student Parsnip, as told by Professor Buckman, was mentioned. Beets and Potatoes were also referred to, and much interesting information concerning them afforded. Special attraction was given to the lecture by the wealth of dried specimens and illustrations at disposal. The next lecture will be on the "Origin of some Flowers;" and in consequence of the interposition of the flower show at Richmond on the 29th, will be given on July 6. A very cordial vote of thanks was given to Mr. Henslow at the close of the lecture.

COMMITTEE MEETING.

JUNE 28.—Seldom has the Drill Hall been more full of exhibits than on the occasion of an ordinary meeting of the committees on Tuesday last. Encouraged, so it would seem, by the Dover House collection of Malmaison Carnations exhibited at the meeting held a fortnight ago, cultivators of this very popular plant showed it in quantity and variety on Tuesday. Never have we seen such a display in the Drill Hall of this type of Carnation as was made by the groups from MARTIN R. SMITH, Esq., Lord SALISBURY, and Messrs. CUTBUSH & SON, and in addition even to these was a splendid group of perpetual-flowering varieties in pots from Messrs. J. PEED & SONS. The collection of MARTIN R. SMITH, Esq., was replete with novelties, four of which were distinguished by the committee's Awards of Merit. The hardy plant nurserymen were largely in evidence, and of their flowers the large showy Paeonies were the principal feature. Sweet Peas, Delphiniums, Campanulas, Begonias, Ferns, and other plants were shown in quantity, and by the Floral Committee a number of awards were made to miscellaneous species. Orchids were not unusually numerous, and a little falling-off may now be reasonably expected. Of fruit there was little shown, but it included a collection of first-rate fruits of the Queen Pine. In the afternoon the Rev. Professor HENSLOW delivered an address to a considerable audience upon certain interesting botanical phenomena suggested by a few of the plants exhibited. We were very sorry to learn that Mr. T. HUMPHREYS, Assistant Superintendent of the Chiswick Gardens, is lying seriously ill from effects of a blow upon the head from a cricket-ball, which occurred a week previous to the meeting.

Floral Committee.

Present: W. Marshall, Esq., chairman, and Messrs. John Fraser, Chas. T. Drury, H. B. May, R. Dean, Wm. Howe, Jas. Hudson, John Jennings, Thos. Peed, R. B. Lowe, Chas. E. Pearson, H. Selfe Leonard, J. Fraser, Jas. Walker, Chas. E. Shea, T. W. Sanders, Herbert J. Cutbush, Ed. Beckett, Geo. Paul, Harry Turner, D. B. Crane, H. J. Jones, Chas. Blick, and J. W. Barr.

From MARTIN R. SMITH, Esq., Warren House, Hayes, Beckenham (gr., Mr. C. Blick), came a magnificent group of Malmaison and other Carnations, including some splendid new varieties of the former. Margot has nice blooms of little softer shade than Prime Minister, Lord Welby has very large flowers of rich colour, Mrs. de Satge is also a very fine flower of splendid character and bright colour, Baldwin has rich pink or rosy-pink flowers. These four varieties of the Malmaison type were recommended Awards of Merit, but others were equally handsome, and a study of them required more time than could be given them under such circumstances as prevailed on Tuesday. Altogether the group was a magnificent one, and a special attraction the whole of the day (Silver-gilt Banksian Medal).

A large display of the pink Malmaison Carnation came from Lord SALISBURY, Hatfield House, Herts (gr., Mr. G. Norman). The plants were staged closely—too thickly, perhaps—together, and the show of bloom was as profuse as possible. The average plant carried about five or six blooms, and few buds were undeveloped (Silver Floral Medal).

Upon the left-hand side of the entrance-door a large space of the floor was beautified by a display of Malmaison Carnations in pots, from Messrs. CUTBUSH & SONS, of Highgate. This group was arranged in glades, and backed by Bamboos: it made a very fine picture. Smaller groups of the highly coloured varieties—The Churchwarden and Prime Minister—were most effective. The blush and white-flowered plants were staged separately. A pretty group of perpetual-flowered Carnations also found a place in this most commendable exhibit (Silver Floral Medal).

Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood Road, London, S.E., had a group of perpetual-flowered Carnations in pots, immediately on the right hand upon entering the Hall. A large part of this group consisted of an excellent border variety, R. H. Measures, a reddish-crimson variety, large flowered, exceptionally free, and a splendidly behaved calyx. Primrose King, too, was shown, and J. W. Christmas, a fine pink coloured flower. Mr. Measures has a crimson flower of better form than R. H. Measures, but probably hardly so free. This was a very bright group, and the varieties shown were really good (Silver Banksian Medal).

Messrs. WM. PAUL & SONS, Waltham Cross, Herts, made an

exhibit of Roses, for the most part grouped together in bunches in boxes. Some of the charming garden varieties, and Messrs. Paul's newest Teas were well shown. There was a dozen or so of standards in pots, representing Medea, T., climbing Niphotos, T., Enchantress, T., Helen Keller, H. P., Madame Hoste, T., and others (Silver Banksian Medal).

A much variegated *Antirrhinum* was shown by Mr. J. A. RUMCIEMAN, Stourvale Nursery, Christchurch, Hants.

Mr. PHILIP FRY showed a few plants of *Fuchsia New Life*, a red-flowered variety with long corolla.

Messrs. WATKINS & SIMPSON, Neal Street, Long Acre, W.C., exhibited half-a-dozen plants of a variegated dwarf *Tropaeolum* named *Queen of Tom Thumbs*, with deep crimson flowers (Award of Merit).

Messrs. BARR & SONS, King Street, Covent Garden, made a large display with hardy flowers, the group containing a fine show of *Pæonies*, single and double-flowered. Many pretty and interesting *Irises*, too, were included, and Iceland *Poppies*, &c. Messrs. Barr also obtained an Award of Merit for *Philadelphus Lemoinei* (see fig. in *Gardeners' Chronicle*, 1897, p. 89, Vol. XXI), apparently little different to the one elsewhere noticed in Messrs. Veitch's exhibit (Silver Banksian Medal).

Mr. F. G. FOSTER, Brockhampton Nurseries, Havant, had a collection of Sweet Peas in about sixty bunches, each of which was charmingly encircled in Ferns (Bronze Banksian Medal).

Mr. J. HUDSON, Gunnersbury House Gardens, Acton, showed blooms of several *Nymphaeas*, including a few of *Marliac's* varieties. These were *N. lucida*, *N. Laydekeri*, in lilac and rose varieties; *N. stellata*, a blue species grown in heated water out-of-doors; the red *N. Ellisiana*, and *N. Marliacea carnea*; *Chromatella*, lemon-coloured, with deep yellow centre; *rosea*, and *albida* (Silver Banksian Medal).

Sir TREVOR LAWRENCE, Bart., Dorking (gr., Mr. Bain), was recommended an Award of Merit for *Hedysarum multijugum*. This pretty purple-flowering climbing plant was figured in the *Gardeners' Chronicle*, pp. 8 and 9, 1895, vol. xviii.

Several interesting flowers were sent by C. G. VAN TUBERGEN, Junr., Haarlem, and a First-class Certificate was recommended to *Lilium "Marham"*, a small and numerous flowered variety, with brownish recurved segments, the basal portion of each being yellow, and spotted thickly with deep purple.

Messrs. PAUL & SONS, Cheshunt, were recommended two Awards of Merit for Roses, and very dissimilar ones. The first is a garden hybrid from *R. canina* × *R. indica*. *Una*, the seedling, is a pure white flowered semi-double garden Rose, possessing very sweet perfume. The flowers are about 4 inches across, and the foliage and shoots are evidence of its robust habit. The other award was to H. P. Allan Cheales, a most attractive Rose when just opened from the bud. Though not suitable, probably, for exhibition, this charming rich pink-coloured Rose is worthy of a place in every Rose-garden. The under side of the petals is silver-coloured, in the way of John Hopper. It is exceedingly robust, and the shoots in Messrs. Paul's garden have grown to great length. From the Cheshunt Nurseries also was a grand lot of *Pæonies* and other hardy flowers (Silver Banksian Medal).

Lord ALDENHAM, Aldenham House, Elstree (gr., Mr. F. Beckett), staged a group of plants upon the floor under the wall of the Hall. The group had a wavy outline, and was arranged on the dot system over a ground of Ferns and like material. The dot plants consisted of *Codiaeums*, *Liliums speciosum* and *roseum*, *Cordylines*, and *Palms* 8 to 10 feet high. A few *Odontoglossum*, *Carnation*, *Crassulas*, *Celosias*, &c., were also employed. The display covered a large space, and most of the plants in it were finely cultivated specimens (Silver-gilt Flora Medal).

Mr. H. B. MAY of Dyson's Lane Nursery, Upper Edmonton, again made a pretty display of Ferns, choosing on this occasion to illustrate particularly the numerous interesting and handsome varieties of *Adiantum* (Silver-gilt Banksian Medal).

Messrs. BALCHIN & SONS, Hassocks Nursery, Sussex, showed six extraordinary plants of *Phenocoma Barnesii*, each about 3 feet high. The foliage was perfect and beautiful, and the plants were crowned with numerous flowers. They were perfect specimens.

In Messrs. GEO. JACKMAN's group of hardy flowers from Woking Nursery, Surrey, we noticed bunches of Sweet Peas; also double-flowered *Pyrethrums*, *Pæonies*, *Heuchera japonica*, &c.; *Campanula urticifolia plena* as a pot plant, and a plant of the new *Campanula mirabilis*. But the plant as exhibited is scarcely so fine a species as was expected. The leaves are thick and fleshy, almost reniform in shape, but will grow probably much longer, about 1½ inch wide, and slightly serrated all round. The flowers are 1½ inch across, and not quite so much deep. They are axillary and terminal, and in colour the palest blue, and silver-coloured at the base (First-class Certificate).

Messrs. H. CANNELL & SONS contributed a fine group of single-flowered *Begonias*. Some of the best were *King of Begonias*, scarlet; *Rev. F. Gaye*, salmon-pink; *Albert George*, orange-red; *Erl Grosvenor*; *Mrs. Dudley Leigh*, pink; *Mrs. Hyde*, white; *Mrs. H. G. Murray Stewart*, scarlet; and *Miss A. Stewart*, lemon-colour (Bronze Banksian Medal).

Messrs. H. CANNELL & SONS, Swanley, Kent, also showed three old plants, 4 to 5 feet high, and nearly as much through of *Lavatera arborea variegata*, they well portrayed the exceeding ornamental character of this variegated mallow.

Mr. B. R. DAVIS, Yeovil Nurseries, Somerset, had a splendid show of tuberous-rooted *Begonias*, single and double-flowered. Both sections were represented by flowers of very fine quality, in size, colour, and form. Some of the

best of the doubles were *Lucanie*, deep carmine; *Mrs. Stothert*, pale lemon; *Miss L. Gott*, pink; *Mrs. W. Herbert Fowler*, palest blush; *Clio*, yellow, good form; *R. B. Parsons*, rose coloured. *Thunderer* and *Florence Nightingale*. The two last-named varieties were recommended Awards of Merit. *Florence Nightingale* has white, almost *Camellia*-shaped blossoms, and *Thunderer* is bright crimson (Silver Banksian Medal).

Messrs. J. VEITCH & SONS showed spikes of flowers representing their strain of *Digitalis purpurea grandiflora*, magnificent in size and colours. An Award of Merit was recommended the strain; also of hybrids between *D. purpurea* and *D. ambigua*; also sprays of *Philadelphus coronarius erecta*, *Hedysarum multijugum*, the red flowered *Escallonia Langleyensis* (see fig. 4, p. 11) of the pretty *Styrax japonica*; *Robini hispida*, *Indigofera decora alba*, and *Magnolia Watsoni* (figured in *Gardeners' Chronicle*, p. 189, 1894, vol. xvi).

A group of upwards of forty plants of *Campanula medium calycanthemum*, in many prettily-tinted varieties; and sprays and plants of the lovely hybrid greenhouse *Rhododrons* were from the same establishment (Silver Flora Medal). Messrs. Veitch had also a very fine collection of *Pæonies*, that made a gorgeous display. Cut flowers, too, were arranged with taste in competition for the Sherwood Challenge Cup. Some of the more noticeable flowers used, were Sweet Peas, Sweet Sultan, Sweet Williams, *Linaria bipartita splendida*, purple, with lighter lip; and the lovely *Schizanthus Grahami retusus*, red, with orange-coloured lip. The variety *alba* is white, with orange-coloured lip. It is a pity we do not see *Schizanthus* more frequently. They are beautiful half-hardy annuals from Chili. Their cultivation is described at p. 8.

Messrs. KELWAY & SON, Langport, Somersetshire, showed a more than usually extensive exhibit of cut-flowers of choice varieties of hardy herbaceous perennials of their own raising, including *Pæonies*, of which *Princess of Wales*, blush, very large; *Chiron*, a purplish-crimson flower of a large size, and very double; *Peter the Great*, similar; *Rosamond*, a purplish-rose, and *Polyphenus* were striking varieties. Other flowers noted were *Eryngium Oliverianum*, of a fine steely-blue colour, and other species of *Eryngium*; *Inula glauca*, in capital heads of deep orange colour; *Pentstemon ornatus Kelwayi*, with bright blue flowers, numerous produced on tall spikes. *Gaillardias* were many and very showy, but without exhibiting much departure in form or colour from old types. One, by name *W. B. Child*, bright yellow coloured variety, obtained an Award of Merit. A white *Delphinium* named *sinense album*, was very pure, and is undoubtedly a pretty variety; *L. podophyllum Somerset*, a very effective yellow variety, received an Award of Merit; *Campanula persica maxima* is an ancient certainly in size, and the colour is light-blue; *Papaver Silver Queen* is apparently a *P. somniferum* variety, more deathly looking than silvery; *Ethionema grandiflorum*, a species with rosy lilac-coloured flowers, making gracefully semi-pendent masses, good for border and rockery. As shown its good points were not seen. *Thymus coccineus*, a bright purplish rose-flowered species, also good for the rockery, the hue of the flowers being decided; *Delphinium nudicaule*, and numerous other *Delphiniums* of the *grandiflorum* section, of which the firm raises so many varieties. A Silver Flora Medal was awarded for the entire exhibit.

Messrs. SUTTON & SONS, seed merchants, Reading, showed *Petunia*, double pink, a fringed variety, sometimes running into green; Sutton's double-flowered *Superb Petunia*, similar to the foregoing in form of flower, but shown in a variety of colours, striped, blotched, and selfs; *Gladiolus*, *Queen of the Roses*—the origin of this variety was not stated, but it appears to be of the *Cypripedium* section, a pretty decorative flower of a pleasing tint. To this an Award of Merit was given.

Messrs. R. WALLACE & CO., Kilnfield Gardens, Colchester, showed a table of cut flowers, of chiefly bulbous plants, including a single-flowered *Pæony* with crimson stripes on a white ground; it was named *P. albiflora striata*; *Hemerocallis aurantiaca major*, a bold rich orange-coloured variety, the flowers having a width of 6 or more inches, very distinct in appearance; *Iris*, including *I. juncea numidica*, with flowers of a reddish-purple colour, coming in corymbs of a dozen or more together (Award of Merit); species of *Brodiaea*, viz., *laxa*, *stellaris*, *congesta*, and *multiflora*; several *Calochortus*, varieties of *Lilium umbellatum* and of *L. Thunbergianum*, exhibiting in both cases some small variations in colour or in form; *L. Szovitzianum*, a pale lemon-coloured species; *L. auratum platyphyllum*, the pure white *L. a. Witte*, and *L. a. rubro-vittatum*; *L. pomponium*, *L. Dahlmansoni*, of a blood-red on the upper side, a cross between *L. dalmaticum* and *L. Hansoni*—a handsome Turk's-cap; *L. rubellum*, n. sp., of a pretty pink colour; *L. Columbianum*, a rich yellow Turk's-cap. Messrs. Wallace have adopted the method of placing the stems of the flowers they exhibit in serpentine folded strips of sheet lead, and standing these on edge in shallow, tin vessels, half-filled with water; it is less troublesome than fiddle bottles and jars, and the moisture given off by the large surface of water tends to give freshness to the blooms (Silver Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair, and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. M. Pollett, J. Gurney Fowler, H. Little, F. Sander, A. H. Smee, E. Hill, W. H. Young, J. Jaques, W. Cobb, H. Williams, S. Courtauld, and T. B. Haywood.

Sir TREVOR LAWRENCE, Bart., the President of the Royal Horticultural Society (gr., Mr. W. H. White), staged a small

group, in which the most prominent feature was the remarkable *Stanhopea Rodigasiana*, an entirely new section of the genus. The flowers, which were produced singly on long pendulous foot-stalks, were six inches across. The sepals, of which the upper one was the narrowest, were concave, cream-white, freckled with rose on the outside; the two lower ones densely spotted with purple on the surface. The column was long, nearly terete at the lower-half, and winged in the upper part, pale green, spotted purple. The very remarkable lip was long and narrow in the basal portion, dark purple, with an ivory-white blotch. The mesochile, or middle division, was composed of two large triangular blades, densely spotted with red, the front angle of each bearing a long bristle-like process. The epichile, or front portion, resembled a long thick tongue, and was also spotted. A very remarkable plant. It secured a First-class Certificate. Sir Trevor Lawrence also showed a grand inflorescence of *Cattleya Warscewiczii*, bearing seven flowers; the fine *Odontoglossum* × *excellens*; *Sanderianum*, *Habenaria rhodocheila*, varieties of *Laelia tenebrosa*, *Masdevallia Barlaeana*, and *Microstylis bella*.

Sir FREDERICK WIGAN, Bart, Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed the beautiful *Laelio-Cattleya* × *Canhamiana* var. *Joyce Wigan*, a superb and large flower, with the sepals and petals silvery-white delicately veined and tinged with rose-colour, and a very handsome labellum, much resembling that of *Cattleya Warscewiczii*, and of an intense purple-crimson (Award of Merit). In the same collection were the typical *L.-C.* × *Canhamiana*; *Sobralia* × *Wigania*, a natural hybrid imported with *S. xantholeuca* (which was also shown). It has a very large flower of a soft yellow tinged with rose. Also with it were *Sobralia Veitchi aurea*, a clear yellow seedling variation of the pretty garden hybrid.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, staged a very fine group made up of forms of *Cattleya Mossiae*, *C. Mendeli*, *C. Warscewiczii*, and other showy species. With them were many remarkable hybrids, prominent being *Cattleya* × *Adela* (*Trianae* ♀, *Percivaliana* ♂), a very handsome novelty with lilac rose-tinted sepals and petals, and rich dark purple-coloured lip (Award of Merit); *Cattleya* × *Harold* var. *Clarissa* (*Gaskelliana* × *Warscewiczii*), a very fine, rose-coloured flower, with a lip of crimson colour in the front part; several fine forms of *Laelio-Cattleya* × *Canhamiana*, *Cattleya* × *Gertrude* (*superba* × *Mossiae*), *Laelio-Cattleya* × *Hippolyta aurantiaca*, with slightly darker purple lines in the lip than the flower formerly shown: *Laelia* × *Stella*, *Epiphrontis* × *Veitchi*, fine purplish of *Disa* × *Veitchi*, *Cypripedium* × *Euryale*, and other *Cypripediums*, a grand plant of the rose-coloured *Phalenopsis* × *Ludlow-violeacea*, and other fine hybrids. Messrs. Veitch also showed some good *Laelia purpurata*, the richly-coloured *Phalaena bicolor purpurascens*; and the remarkable *Vanda cristata superba*. The group was awarded a Silver Flora Medal.

A Silver Flora Medal was also awarded to Messrs. HUGH LOW & CO., Bush Hill Park, for a fine group, in which were at least two grand novelties. These were the handsome *Cypripedium* × *L'Ansoni* (*Morganiae* × *Rothschildianum*), a fine hybrid which in many features, and especially in the breadth of its ivory-white, purple-spotted petals, resembled the famed *C. Stonei platytanum*. The upper sepal is of ivory-white, furnished with numerous purple lines, and the lower one is similar, but smaller, and the lip creamy-white, with rose-coloured face (First-Class Certificate); and *C.* × *Mrs. Reginald Young* (*Lowi* × *Sanderianum*), a very handsome and quaint-looking cross, in which the curved ribbon-like petals of *C. Sanderianum*, with their characteristic undulation, was well displayed. The flower was also of that lurid reddish-yellow, with brownish markings seen in that species (First-class Certificate). Also in this group were a very fine show of large-flowered *Cattleyas*, one fine *C. Mossiae Reineckiana* being specially attractive; also *Epipendrum prismatocarpum*, with four spikes; some fine *Oncidium crispum*, varieties of *Laelia tenebrosa*, *Cypripedium* T. B. Haywood, and *C. Lawrenceanum*, Bush Hill var., very dark-coloured.

Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, secured a Silver Banksian Medal for an effective group, in which were *Laelio-Cattleya* × *Edouard André*, a pretty hybrid of the *L.-C.* × *Canhamiana* class, with nearly white sepals and petals, and a lip of velvety-purple hue; *Cattleya* × *Breuteana* (*superba* × *Loddigesii*), which retained much of the features of *C. superba*; the pretty *Cypripedium Lebaudyannum*, *C.* × *Harrisianum superbum*, and other *Cypripediums*; *Pescatorea Lehmanni*, *Aërides expansum*, varieties of *Laelia tenebrosa*, *Thunia Marshalliana*, and other showy species.

Messrs. STANLEY MOBBS & ASHTON, Southgate, were awarded a Silver Banksian Medal for an effective group of *Cattleyas*, with which were *Laelia tenebrosa*, *L. purpurata*, *Miltonia vexillaria*, *Stanhopea tigrina* Ashton, *Lycaste Deppoi virens*, with green sepals; *Laelia tenebrosa aurea*, and other varieties of *L. tenebrosa*, a grand *Odontoglossum luteo-purpureum*, *Oncidium spillopterum*, *O. Lanceanum*, *O. Papilio*, *Cattleya Schilleriana*, *Mormodes pardinum*, *Chysis aurea*, &c.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr., Mr. Jas. Hudson), showed the clear yellow *Mormodes pardinum unicolor*. W. GILLET, Esq., Fair Oak, Bishopstoke (gr., Mr. Carr), showed a noble form of *Laelia purpurata*. F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent three very distinct forms of *Masdevallia Chimera*. F. P. WHITE, Esq., The Willows, Wargrave, Twyford (gr., Mr. W. Pope), showed *Cattleya guttata* with thirty-two flowers on a spike.

Dr B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed *Odontoglossum* × *excellens* "Mrs. De B. Crawshay," a most remarkable variation, with clear, bright yellow flower of thick texture bearing some large chestnut-brown blotches. The labellum, which resembled *O. triumphans* in form, had a white base, as have the petals in a lesser degree, its centre was decorated with a large chestnut-coloured blotch, and the apex was yellow.

THOS. McMEKIN, Esq., Falkland Park, South Norwood (gr., Mr. A. Wright), showed the fine *Cypripedium Rothschildianum* Falkland Park var. T. W. SWINBURNE, Esq., Corndean Hall, Winchcombe, sent two flowers of grand form of *Sophranitis grandiflora*, that named "giganteum" being 3½ inches across. The Rev. E. HANLEY, Royal Crescent, Bath, sent flowers of *Cattleya Mossiae Wagneri*.

Fruit Committee.

Present: Philip Crowley, Esq., chairman; and Messrs. Jos. Cheal, Jas. H. Veitch, W. Poupart, A. F. Barron, M. G. Geeson, W. Pope, Alex. Dean, J. W. Bates, W. J. Empson, Geo. Wythes, H. Balderson, F. Q. Lane, G. Norman, J. Wilard, Robt. Fife, and T. J. Saltmarsh.

A most attractive exhibit of Tomato fruits was made by Mr. J. Hudson, gr. to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton. Sprays of fruit were shown, and also pretty baskets filled with some of the following and other varieties:—Abundance, Golden Jubilee, Peachblow, Sutton's Dessert, Best-of-All; all of these were represented by good fruits. Early Rivers' and Bigarreau de Schrecken Cherries from an out-of-doors wall with south aspect in same garden were also very fine (Silver-gilt Banksian Medal).

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, showed some fine fruits of Cherry Guigne d'Annonay. This is a good early Cherry, and in this instance it was about ten days earlier from pyramids than Early Rivers.

Excellent fruits of Royal Sovereign Strawberry were shown by Mr. GEO. WYTHES, Syon House Gardens.

A magnificent new Peach was exhibited by Messrs. T. F. RIVERS & SON, Sawbridgeworth. This is named *Thos. Rivers*, and is described as a late variety. All the fruits shown were of large and capital colour, and the flavour was by no means poor. They were forced in a house started on December 20, 1897; and Cardinal and Early Rivers', Nectarine, from the same house, were ripe in April and May. The new Peach, it is said, succeeds equally well in a late house, and it will be likely to prove a valuable addition to our late Peaches (First-class Certificate).

A Silver-gilt Knightian Medal was recommended to a collection of nine first-class fruits of the Queen Pine, shown by A. VON ANDRÉ, Esq., The Warren House, Stanmore. These fruits averaged 5½ lb. each in weight, and in appearance were perfect.

From I. J. ROLFE, Esq., Stamford-le-Hope, Essex, were shown numerous fruits and sprays of some of Tomato Rolfe's Seedling, a large heavy, perfection-typed fruit. Five of the bunches weighed 14½ lb. The variety is now being tested at Chiswick (Cultural Commendation).

WOOD GREEN AND DISTRICT HORTICULTURAL.

JUNE 17.—A very interesting lecture on "Cactaceous Plants" was delivered before the members of this Society by Mr. H. G. BOURNE, F.R.H.S. (Alexandra Palace Gold Medallist), at their meeting on Friday.

After prefacing his remarks with the desire that more interest should be taken in these plants, he said:—

The laws of culture which I shall propound to-night are of my own framing, the results of my own experience, and I am confident if followed correctly will work out the best results. Taken generally, there are about 10,000 varieties of Cacti, true or proper, in about fifteen genera. They were mostly children of the tropics, though some of them were nearly hardy in this country. Among these were *Opuntia*, *Piccolomini*, *Rafinesquiana*, *Echinocactus Simpsoni*. These will reward with a mass of bloom during the summer. They should be planted on rock work, having a south aspect, in equal parts of good sandy loam and brick-rubble. Perfect drainage is needful, and they are best covered by moveable hand lights during the heavy autumnal rains. In frames their culture is good, this being a method extensively resorted to by Continental growers; but owing to climatic changes, the best method of cultivation in this country is undoubtedly the greenhouse.

As regards temperature, it may be surprising to some to hear it never can run up too high, assuming that ventilation be properly attended to. This of course applies to solar heat. When this begins to fail in the autumn, firing must of necessity be carefully attended to. A temperature of 60° to 65° by day, and 50° to 55° by night, will keep the plants in good health; and here it may be well to mention that careful attention to temperature is a good preventative against all sorts of insect pests. There was a great diversity of opinion as to what constituted a fit and proper soil for the successful cultivation of the Cactus. My experience has been such as leads me to the conclusion that good rich maiden loam, fine sand, and brick-rubble, in equal proportions, will grow most varieties well, though if a few pounds of oyster-shells and nodules of charcoal can be included, so much the better. Many growers are greatly in favour of the addition of manure to the compost for Cacti, but I must humbly express my disapproval of this practice. My reason for so doing is the following:—Many varieties of Cacti are subject to sudden rotting off during a damp, foggy winter,

and I am certain that the rank, excessively sappy growth caused by the addition of animal manure not becoming sufficiently ripened is the great fault. Mr. Lees will tell you that this over-indulgence in manures is detrimental to the cultivation of the Autumn Queen, and I venture to assure you that the same applies to the Cactus family. Now, before we proceed any further, it must not be imagined that there is anything particularly difficult in the cultivation of any genus of the Cactus tribe; all that is necessary is proper and careful attention to a few little details which in themselves are all-important, and the neglect of which will soon be manifest in unhealthy appearances of plants and adequate loss of bloom. When you receive some Cactus cuttings or plants from a friend or dealer, carefully overhaul them for insect pests. Should these be present in the form either of Thrips-scale, mealy-bug, or green or black fly, immediate operations must be put in force to eradicate them. Undoubtedly the best remedy for fly is tobacco. Isolate the plants in a frame, and smoke them on two consecutive evenings, taking care that the stems of the plants are at the time quite dry. This will strongly influence the effect of the smoke. They can be well washed with the syringe prior to their removal to the house, not forgetting, if the soil be wet, to turn the pots on their sides, and apply the syringe as much as possible sideways. If the pest assumes the form of scale, Thrips, or bug, dip the cuttings or plants into a solution of 3 oz. of soft-soap to one gallon of water, at a temperature of 100° to 125°, for ten or fifteen seconds. Some amateur growers seem to be afraid to give water in a sufficient quantity to the plants during the growing season, and this is one great reason why they so soon become attacked both above and under ground. So we see that from April to August, during which period most varieties put on their new growth, water must be freely applied both at the roots and overhead by means of the syringe. The question so often met with—How often ought I to water my plants?—can only be answered thus: Give the plants plenty of water when they require it, and when not do not apply it. This question of the application of water is also a very important one, the presence of insects as already mentioned often being traceable to neglect.

It is well to bear in mind that the removal of insects from a Cactus is slightly hampered by surroundings. These are the spines, and in reference to their power of penetration it is better to accept the word of one who knows by his own experience than to experiment yourselves. Some spines, on varieties such as *Echinocactus texensis*, *E. cornigerus*, *Brevihamatus* (central one only), are hooked, and will make as frightful a gash as a tiger-cub's claws. While upon the question of spines, I should like to impress upon you the fact that the variation of colour in the spines is one of the many attractions which the members of the Cactus family possess. One of the finest examples of this peculiarity is found in *Echinocactus Grusoni* (the Golden Cactus). *Echinocactus aureus* is another fine golden-spined sort (but rather rare), while in *Echinocactus bicolor* the spines are so colouring as to assume tints of yellow, red, and amber colour, forming a fine contrast to its rosy-purple flowers. In *Echinocactus begium* the spines are white, tipped with purple. *E. cornigerus* has broad purple spines, which are as strong as steel. The spines of the *Echinocereus candelans* (the Rainbow Cactus), has spines which are all colours of the rainbow, and should be included in all collections. The colours of the stems of some varieties of *Cereus* are also very attractive. *Cereus Jamacaru* is a striking plant by reason of the fine blue colour of its stem. Some of the members of the genera—*Cereus mammillaria* and *Echinocactus*—are remarkable for the handsome fruits which they produce. These fruits are formed after the flowering period, and are particularly handsome. The propagation of Cacti is a very simple process, consisting of seeds, cuttings and offsets; I prefer the propagation rather from cuttings than seed, because in the case of the latter there is a possible doubt of your getting it fresh.

The speaker then followed with a few remarks upon the so closely-allied plants, Succulents, and was accorded a hearty vote of thanks at the close.

HORTICULTURE AT THE ROYAL AGRICULTURAL SOCIETY'S SHOW, BIRMINGHAM.

JUNE 20.—The show of the Royal Agricultural Society opened on the above date in fine weather, at the ancient borough of Sutton Coldfield, whose inhabitants vied with each other in their display of bunting. The showyard was situated in Four Oaks Park, a distance of 9 miles from Birmingham, and the success of the show was largely dependent on the assistance of the various railway companies. The number of visitors on Monday cannot compare with those visiting Manchester last year, 2642 persons having passed the turnstiles, against 4547 at the latter city last year. At Birmingham in 1876 on the first day of the show the visitors numbered 5256.

The first object to notice on entering the park was Messrs. SUTTON & SONS' stand of garden and farm seeds and produce, displayed in a conspicuous manner, a seed-tester and germinator forming a noteworthy feature of the exhibit. Another novel feature was a panoramic exhibit of photographic illustrations of vegetables and flowers raised by themselves or their customers. A fine group of *Gloxinia* plants was also exhibited, in order to show the great progress that has been made in the improvement of this beautiful and popular flower. Potatoes were represented by about twenty-five varieties, some of the best being Sutton's

Windsor Castle, Supreme, Triumph, Satisfaction, Magnum Bonum, Reliance, and the Flourball. The firm likewise showed Peas in capital form as grown in flower-pots, the variety May Queen being especially notable for its heavy crop of pods. The climbing French Bean, with a profusion of pods, was also shown as grown in flower-pots. The Dessert and Golden Nugget Tomato formed a prominent part of the display, the former being a very prolific variety, and excellent for consuming in the raw state. There was much more in this stand that appealed more to farmers than gardeners, of which we omit notice.

The Messrs. WEBB & SONS, of Stourbridge, had perhaps the most imposing section of the stand, viz., that devoted to flowers, where Webb's superb strains were represented by really fine plants in bloom of *Calceolaria*, *Begonia*, *Petunia*, Sweet Peas, Stocks, Lilliums, Gladioli, &c. Vegetables formed another meritorious collection, the Beans, Parsnips, Cucumbers, Tomatoes, Cauliflowers, Carrots, Leeks, Onions and Lettuce being the finest we have seen for so early in the season. Webb's new Peas Pioneer and Senator growing in pots, showed a profusion of long well-filled pods, whilst among the varieties of Potatoes Webb's New Motor was conspicuous for its large size and splendid quality. Messrs. Webb & Sons had decorated the exterior of the Hall with ornamental lawns, flowering plants, Palms, &c., adding materially to the attractiveness of the show-yard.

MESSRS. JAMES CARTER & CO., of High Holborn, London, had an imposing erection 100 feet in length, containing numerous fine specimens of roots and cereals, besides a miniature lawn formed of the finest grasses, and groups of cut flowers brought from their flower farm at St. Osyth in Essex.

MESSRS. LITTLE & BALLANTYNE, nurserymen, Carlisle, exhibited their new Holly, Golden King, and a striking variety of *Cupressus macrocarpa* named *lutea*, both acquisitions to the garden.

MESSRS. HARRISON, of Leicester, showed excellently and well garden together with farm productions, and we noted a fine late Broccoli named Harrison's Victoria, very weighty, and as shown, in grand condition. Good examples of the Leek, Pea, Cucumber, and other vegetables were remarked in this stand. Messrs. DICKSONS, of Chester, exhibited productions of the farm and garden. The horticultural building-trade was well represented by DUNCAN TUCKER, of Tottenham; MESSENGER & CO., Loughborough; WRINCH & SON, of Ipswich and London; whilst Messrs. BAYLISS & INMAN had some unique rustic-work in the form of summer-houses and garden-seats. Messrs. RANSOME showed largely lawn-mowing machines. The excellent garden pottery of C. NEWAY G. WARNE, Ltd., Royal Pottery, Weston-super-Mare, was largely in evidence.

RYDE, ISLE OF WIGHT.

JUNE 23.—The fourteenth annual Rose Show was held at Westmont on the above date, and was opened by the Mayor (Alderman E. MARVIN, J.P.). The exhibits were numerous, and of better quality than last year.

The Gold Medal for thirty-six cut Roses was won by Mr. F. CANT, and the Silver Medal by Mr. R. E. WEST.

Open to the Isle of Wight only.—Mr. J. O. BROOK received a Silver-gilt Medal, and Mrs. MURRAY a Silver Medal for twenty-four cut Roses.

Mr. B. LADHAMS, of Shirley, staged a fine collection of Pinks and hardy herbaceous plants, and received the Isle of Wight Horticultural Imperial Association's Certificate or Cultural Merit.

Mr. E. R. GOOLE, Ryde, staged a non-competitive exhibit of *Pelargonium* cut blooms.

BATH SHOW OF THE NATIONAL ROSE.

JUNE 23.—In connection with the Bath Floral Fête and Band Committee, the National Rose Society held their annual southern provincial exhibition in the Sydney Gardens, Bath, glorious weather prevailing. The date is a week earlier than usual, and this fact, coupled with the backwardness of the season, prevented many noted rosarians from competing, and, as a consequence, the exhibits were not so numerous as they would otherwise have been. But despite the frowns of Nature, the show was in every way good; the exhibits, without exception, were remarkable for quality, in fact, one could scarcely imagine Tea Roses being in finer condition. One of the chief features of the show were the garden Roses, the Tea Roses, and the groups of miscellaneous plants.

ROSES, NURSERYMEN ONLY.

For forty-eight blooms, distinct varieties, prize a Silver Cup, presented by the Mayor of Bath, the winner was Mr. B. R. CANT, Colchester. He staged a lovely collection of blooms, including the varieties Madame Cusin, Caroline Testout, Souvenir de S. A. Prince, Lady Fitzwilliam, Annie Laxton, Kaiserin A. Victoria, and Marie Van Houtte. In this class the flowers of each competitor were clean, of good quality, and well developed. Messrs. D. PRIOR & SON, Colchester, took the 2nd place; Messrs. FRANK CANT & CO., of Colchester, the 3rd.

For the best twenty-four blooms, distinct single bloom varieties, Mr. G. PRINCE, of Oxford, was 1st with what was one of the best lots present, which composed fine examples of Lady M. Fitzwilliam, White Lady, Caroline Testout, Mrs. W. J. Grant, and Innocente Pirola. Messrs. J. B. BURRELL & CO., Howe House Nurseries, Cambridge, were 2nd.

Messrs. D. PRIOR & SON took the 1st prize for twenty-four distinct varieties in trusses of three blooms, his best blooms being Mrs. J. Laing, White Lady, Marie Van Houtte, and Lady M. Fitzwilliam; Messrs. F. CANT & Co. were 2nd.

For the best twelve single blooms of any Rose, except Tea or Noisette, Messrs. D. PRIOR & SON were placed 1st with the variety Lady M. Fitzwilliam; and Messrs. B. CANT with Madame Gabrielle Luizet.

In the Tea and Noisette section of the schedule, the best twenty-four blooms were shown by Mr. G. PRINCE, Oxford. His blooms of Princess of Wales and Comtesse de Nadaillac were unusually fine ones.

Garden Roses.—Thirty-six varieties in not less than three trusses in each, Messrs. COOLING & SON were 1st with the finest collection of these pretty Roses ever exhibited at Bath. All sections of these Roses were well represented, and included their new hybrid Bourbon Rose Purity. Messrs. PAUL & SON showed a collection of garden Roses, which made a good 2nd.

OPEN CLASSES.

The National Rose Society's much-coveted Gold Medal, for three trusses of any new seedling Rose or distinct sport (either not yet in commerce, or not distributed earlier than November, 1897), was won by Messrs. A. DICKSON & SON, nurserymen of Newtownards, Co. Down, Ireland, with lovely blooms of their new Rose, Miss Bessie Brown.

The Tea or Noisette Section of Roses, in twelve varieties, shown in triplets, brought together a fine lot of blooms, and Mr. G. PRINCE was 1st, especially good being his blooms of Cleopatra, Hon. Edith Gifford, the S. A. Prince, and C. de Nadaillac.

For the best twelve blooms of any one variety, Mr. G. PRINCE was again 1st with a beautiful stand of well-formed and richly-coloured Maréchal Niel; and Mr. B. R. CANT was 2nd with lovely flowers of the variety Cleopatra.

For the best twelve single-flowered Roses, of the section "Garden or Decorative," in not less than three trusses of each, 1st, Messrs. PAUL & SON, nurserymen, Cheshunt.

THE AMATEUR CLASSES.

For the best twelve blooms, distinct varieties, A. H. GRAY, Esq., Bath, was 1st in this, which is one of the principal classes for amateurs, and carries Cooling's Cup as its best prize. The winning box contained well-developed flowers, and judiciously selected in regard to colours. There were included: Maman Cochet, Comtesse de Nadaillac, Princess Beatrice, The Bride, Marie Van Houtte, Catherine Mermet, Princess of Wales, Anna Olivier, Golden Gate, Souvenir d'Elise Vardon, Hon. Edith Gifford, and Maréchal Niel. The 2nd prize was taken by that eminent rosarian, Rev. J. H. PEMBERTON, who showed extra fine blooms of Caroline Testout, Madame Victor Verdier, La France, Marchioness of Dufferin, Jean Ducher, and Souvenir d'un Ami. And the 3rd prize was taken by S. P. BUDD, Esq., whose best flowers were Mrs. B. S. Crawford, Madame Cusin, A. K. Williams, Ethel Brownlow, and Rubens.

For the best eighteen blooms of the so-called "Exhibition Roses" of the National Rose Society's Catalogue, and including Teas and Noisettes, A. H. GRAY, Esq., was 1st, with flowers of great beauty; especially so were the varieties Anna Olivier and Edith Gifford. The exhibitors in this competition must be growers of not fewer than 2000 plants.

The Prince Memorial Cup, which is the 1st prize in a competition among growers of not fewer than 500 plants, and must be won for exhibition varieties, fell to Mr. CONWAY JONES, Gloucester, whose box of twelve varieties included some that were unusually beautiful, well-developed blooms.

Rev. J. H. PEMBERTON took the 1st prize for eighteen varieties of garden Roses.

BEST BLOOMS, NURSERYMEN.

The National Rose Society's Silver Medal, of which six are awarded, was won for Hybrid Tea and Noisette Roses by Messrs. A. DICKSON & SON, with the variety Tom Wood. The Silver Medals were awarded to Messrs. BURRILL for the best Hybrid Tea, Lady Mary Fitzwilliam; for the best bloom, Tea or Noisette, to Mr. GEO. PRINCE, Oxford, for Comtesse de Nadaillac.

The Medals fell to amateurs as follows:—To S. P. BUDD, Esq., in the Hybrid Tea, Tea, or Noisette classes, for a bloom of *Alphonse Soupert*; to H. GRAY, Esq., for Hybrid Tea *Caroline Testout*; and to the Rev. J. PEMBERTON, for *Maman Cochet*.

The local classes for amateurs were well represented, and some very fine blooms were shown, generally of varieties previously mentioned.

The show was considerably augmented by other exhibits, as, for example, an excellent group arranged for effect from Mr. J. CYPHER, of Cheltenham, the form of the group being oblong. The plants which were employed included *Cattleya citrina* in quantity, and other species of Orchids, *Codiaeums*, and *Caladiums*. Mr. CATER was 2nd for an excellent group that also comprised many well-grown Orchids beautifully flowered, notable being plants of *Cattleya Morgani*, *C. Mendel*, and *C. Mossie*. Messrs. R. VEITCH & SON, Exeter, staged a splendid lot of herbaceous perennials as cut flowers, together with rare species of plants grown in pots, viz., *Acalypha Sanderiana*, *A. Godseffiana*, and *Dracena Sanderi*. These exhibitors had arranged a miniature specimen of rock-work. Messrs. COOLING staged an excellent group of herbaceous *Paeonies*, as had also Mr. WHITE, Worcester; and Messrs. BARR & SON, Covent Garden, made a great display of herbaceous perennial and bulbous plants; and Mr. F. HOOPER, Bath, showed a very creditable group of Pansies and Violas.

Mr. GOULD, Rock Hall, Bath, vice-President National Cactus Society, received a Certificate of Merit for a large and interesting collection of Cacti, in which were many rare species.

THE CONFERENCE.

During the afternoon a conference was held, and Mr. W. F. COOLING in compliance with a request from the N. R. S., opened a discussion by reading a paper on "How different kinds of Roses should be pruned." This was followed by a discussion in which several leading rosarians took part. A feature of the discussion was the laying down of the principle that there was a great difference between pruning so as to produce Roses for show, and pruning for garden ornamentation. In summing up his paper, Mr. COOLING said the points upon which he wished to lay stress were (1), That a certain section of Roses should not be pruned in the spring. (2), That H. P. and T. Roses intended for garden decoration did not require such hard pruning as was usually recommended. (3), That the most important point in all pruning, at whatever time it was performed, and with whatever variety, was the cutting out of all growths that had flowered to bring about as it were a renewal of the plant; and lastly the peculiarity of certain varieties. The chairman, Mr. R. B. CATER, moved a cordial vote of thanks to Mr. COOLING for his paper.

WINDSOR, ETON, AND DISTRICT ROSE AND HORTICULTURAL.

JUNE 25.—The royal borough of Windsor has a pretty little exhibition each year, and it is nothing more than a horticultural show, having absolutely none of the variety attractions that have been found to be so essential to the prosperous existence of many societies.

But the one we visited on Saturday last, like some of its predecessors, was held on the slopes, just under the very walls of the Castle, and with the patronage of the Queen, and the devotion of an energetic secretary in Mr. Romaine, the Society seems to get along comfortably enough.

From our point of view, interest centres chiefly in the Roses shown in the open classes, beyond which the exhibits are purely of local contribution. But there are usually good Roses at Windsor, and this year those staged were the best seen this season up to last Saturday, being of much better quality than those at the National Society's show at Bath earlier in the week. But the good Roses cost the Society something, for Mr. B. R. CANT won the Queen's Challenge Cup for the second time in succession, and it has become his property, a fact that the Secretary referred to good-humouredly as "a blow." Below we give details concerning the Roses, and of some of the best of the more local exhibitors.

OPEN ROSE CLASSES.

Proof that the Queen's Silver Cup, value 10 guineas, was a coveted prize, is furnished by the fact that there were six competitors in the class. The schedule called for forty-eight blooms, distinct, and one collection was disqualified for inadvertently failing to comply with this condition.

The two best exhibitors were Messrs. B. CANT & SONS, and D. PRIOR & SONS, both Colchester firms. The judges decided in favour of Messrs. Cant, and as this firm won the Cup last season, it now becomes their property. The 1st prize collection contained an even lot of flowers, few of them being of extra or inferior quality. Some of the best, however, were Madame Gabrielle Luizet, Magna Charta, Duke of Edinburgh, Princess of Wales, Marquise Litta, Cleopatra, Mrs. John Laing, Madame Cusin, and Catherine Mermet. In Messrs. A. PRIOR & SON's exhibit there were fine specimens of the following varieties:—White Lady, Souvenir de la Malmaison, Heinrich Schultheiss, Magna Charta, and Mrs. John Laing. There was scarcely a point difference in the two exhibits. The 3rd prize was taken by Messrs. HARKNESS & SONS, Hitchin, Herts, and Bedale, Yorkshire; the other exhibitors being Mr. CHARLES TURNER, Messrs. FRANK CANT & Co., and Mr. GEO. PRINCE, Oxford. The Teas in the last-mentioned exhibitor's stand were very fine, and included a splendid bloom of Comtesse de Nadaillac.

The best collection of eighteen blooms, Teas or Noisettes, came from Mr. PRINCE, whose flowers generally were of good average quality. Messrs. F. CANT & Co. beat Messrs. PRIOR & SON for 2nd place. Mr. PRINCE's varieties included Cleopatra, The Bride, Comtesse de Nadaillac, Catherine Mermet, Princess of Wales, Madame Cusin, Maman Cochet, Alba rosca, Medea, Souvenir d'Elise Vardon, and Princess Beatrice.

Mr. BENJAMIN R. CANT was 1st for twelve distinct Roses in trebles, such varieties as *Gustave Piganeau*, *Ulrich Brunner*, *Madame Gabrielle Luizet*, and *Marquise Litta* telling considerably. Messrs. FRANK CANT & Co. were not far behind as 2nd; and it was a good exhibit that won 3rd prize for Mr. GEO. PRINCE.

The best twelve single trusses of any H. P. or H. T. were from Messrs. FRANK CANT & Co., who showed a pretty group of the distinct coloured Mrs. W. J. Grant. Mr. B. R. CANT followed with *La France*.

Mr. GEO. PRINCE had the best dozen of any Tea or Noisette, showing Comtesse de Nadaillac. Of the showy garden Roses there were three exhibits of eighteen bunches each, there being little difference in the method of showing the flowers in either case. Messrs. PAUL & SON, Cheshunt, were 1st, and in their faced sprays included several good varieties of comparative novelty. *Dawn*, a large single-flowered pink variety; and *Royal Scarlet*, may be singled out as the best of these. Mr. CHAS. TURNER, Slough, was little behind, and in his 2nd prize stand included some excellent bunches.

AMATEUR AND LOCAL CLASSES.

In the class for twenty-four blooms, there were two exhibits, but only one of these should have been staged. This collection, from R. E. WEST, Esq., Firth Dene, Wray Park, Reigate, included many very fine blooms, such as *Captain Hayward*, *Marquise de Castellane*, *Gustave Piganeau*, *Duke of Edinburgh*, and some others. This same exhibitor had 2nd prize for a collection of six H. P. blooms, showing *Marquise de Castellane*; and Mr. WEST won also for twelve Teas and Noisettes, being followed by W. C. ROMAINE, Esq., whose bright little flowers were little inferior. Mr. WEST had the best six trebles.

GROUPS AND FLANTS, &c.

There were as many as seven groups of plants arranged in effect in a half-circle 12 feet by 6 feet. The 1st prize group from Sir CHAS. FIGGOTT, Bt., Wexham Park (gr., Mr. J. Fleming), was a group of very choice plants, and the arrangement left little to be desired. Whether the *Codiaeums*, *Cattleyas*, *Carnations*, *Lilies*, or other species, be considered, they were of fine quality.

Sir ROBT. HARVEY, Bt., Langley Park, Slough (gr., Mr. A. Gillie), was 2nd, and the rest of the exhibitors were considerably behind.

For four specimen plants, the Hon. H. C. LEGGE, Fulmer, Slough (gr., Mr. T. G. Mowbray), was to the front, and showed magnificent examples of two *Codiaeums*, an *Asparagus plumosus*, and an *Alocasia*.

F. BAKER, Esq., Ottershaw Park (gr., Mr. T. Osman), had a well merited 1st prize for four specimen Ferns, and was 2nd also in the previous class.

Table plants were very pretty, and the best group of six was shown by Mr. Jas. Wood, gr. to Lord Boston, Heddon Park, Maidenhead.

In the little light-coloured tent containing the table decorations there were five exhibits, one of these being non-competitive. The 1st prize arrangement by Miss Ed. GOULD was very pretty, with Poppies and Sweet Peas, relieved by *Smilax* and a little Fern. Miss GEE, who was 2nd, used much Honeysuckle, Sweet Peas, *Gladiolus*, *Ampelopsis* sprays, &c. It was a little overdone, otherwise the effect would have been very beautiful. Mr. T. WILLIAMS, of Ealing, had a non-competitive exhibit of much merit.

FRUITS AND VEGETABLES.

The best collection of four dishes of fruit was from Lord Boston. He had two bunches of Black Hamburg Grapes, dishes of Nectarines, Brown Turkey Figs and a Melon. Two fine bunches of Black Hamburg Grapes came from Mr. G. IANE, gr. to Miss RIDGE, Staines, and were 1st in their class. F. BAKER, Esq., was 1st for White Grapes.

Peaches were good generally, a capital dish being shown from the Hon. H. C. LEGGE's garden; and Lord Boston's Nectarines were fine.

The best collection of nine dishes of vegetables came from the Hon. C. S. IRBY, Hitcham Grange, Maidenhead (gr., Mr. D. Paxton), and were good. Miss RIDGE obtained 1st prize in Messrs. Sutton's class for vegetables. The best Tomato shown in a separate class was the variety *Polegate*.

HONORARY EXHIBITS.

These were displayed in a tent devoted to them. A circular group of Roses in pots, fringed with Ferns, from Mr. CHAS. TURNER, Royal Nurseries, Slough, was a pretty feature; and but a few yards from this was a table laden with Orchid treasures from The Dell, Egham, Baron SCHROEDER's garden. This was gay with *Cattleya Mossie*, *Vanda teres*, fine forms of *Odontoglossum crispum*, *Miltonia vexillaria*, *Od. Hall leucoglossum*, *Cypripediums*, &c.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, richly furnished a table with a wealth of *Cattleya Mossie* in great variety and fine quality. *Laelia tenebrosa*, a few *Cypripediums*, and highly-coloured *Codiaeums*, completed this fine exhibit.

Pelargoniums from Mr. CHAS. TURNER made the gayest circular group in the show, the plants being abundantly furnished with flowers of dazzling colours.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, exhibited flowers of a number of species and varieties of *Lilium*. The varieties of *L. Thunbergianum* alone furnishing an abundance of deep colour. Irises in variety, *Ixias*, *Alliums*, *Paeonies*, and the new pink-flowered *Lilium rubellum* were all very beautiful in Messrs. WALLACE's exhibit.

Mr. W. H. FITT, of 24, Thames Street, Windsor, had bunches of hardy flowers and a few florist's arrangements, and bunches of hardy flowers, all of them being very bright and fresh looking.

Messrs. BARR & SONS, 12, King Street, Covent Garden, London, W.C., made a considerable display of hardy flowers, inclusive of Irises, pretty Iceland Poppies in various colours, and showy varieties of Moutan *Paeonies*.

Another group of hardy flowers came from Mr. ERIC F. SUCH, of the Royal Berkshire Nursery, Maidenhead, in which a number of good hardy species were presented in fine condition.

Messrs. GEO. JACKMAN & SON, Woking, Surrey, had cut Roses, including some good garden varieties; Sweet Peas, *Paeonies*, sprays of hybrid Clematises, and other hardy flowers.

One of the largest displays of hardy flowers was from the nursery of Messrs. JAS. VEITCH & SONS, King's Road, Chelsea, in whose collection was noticed very fine *Paeonies*, *Pyrethrums*, *Gallardia* hybrids, *Heuchera sanguinea*, sprays of *Tropaeolum polyphyllum*, and other pretty things.

Lady MARY CURNIE, Clewer Hill House, Windsor (gr., Mr. F. H. Beney), had a very pretty collection of Sweet Peas in sprays, and for a portion of these obtained Mr. ECKFORD's prize for twelve varieties.

CROYDON HORTICULTURAL.

JUNE 29.—The thirty-first annual show of the Croydon Society was held on the above date in the grounds of Brickwood House, close to East Croydon Railway Station. There are usually some first-class Roses exhibited at Croydon, but the lateness of the present season, coupled perhaps with the fact that the gay town of Richmond was holding its annual show upon the same date, resulted in limiting the extent of the display, the number of competitors being fewer than is general at Croydon. Nor was the quality of the blooms first-rate, but considerably less than the average at Windsor on the previous Saturday, where there was also greater competition. Below we give details of the Rose classes, and of the more important of the plants and fruits. There were other exhibits of a local character, and from cottagers.

ROSES.

For forty-eight Roses, distinct, Messrs. F. CANT & Co., Colchester, beat Messrs. PRIOR & SONS, also of Colchester. The varieties in the 1st prize stand were A. K. Williams, Mrs. Frank Cant, Camille Bernardin, Madame Gabrielle Luizet, Victor Hugo, Marchioness of Dufferin, Mrs. W. J. Grant, Dupuy Jamain, Duke of Wellington, Cleopatra, Duchess of Bedford, Jennie Dickson, Helen Keller, Caroline Testout, Messrs. R. G. Sharman Crawford, Auguste Rigotard, Ernest Metz, Beauty of Waltham, Rubens, Alfred Colomb, Princess of Wales, François Michelin, Marchioness of Downshire, Duke of Albany, Ethel Brownlow, Captain Hayward, Marguerite de St. Amand, Medea, Devoniensis, Crown Prince, Prince Arthur, Maréchal Niel, Duke of Teck, Jules Finger, Madame Cusin, Maman Cochet, Dr. Sewell, Suzanne-Marie Rodocanachi, Niphetos, La France, Abel Carrière, Comtesse de Nadaillac, Dr. Andry, Catherine Mermet, Reynolds Hole, and Souvenir d'un Ami.

Messrs. F. CANT & Co. again beat Messrs. PRIOR in a class for twenty-four Roses in trebles, the display being a very good one. Some of the best were Dr. Andry, Capt. Hayward, Duke of Wellington, Mrs. W. J. Grant, and Beauty of Waltham.

There were three competitors in the class for twenty-four Roses, distinct, reserved to growers not exhibiting in the two classes described above.

Mr. JOHN R. BOX, of West Wickham and Croydon, won 1st prize; the best blooms in his stand were Magna Charta, Margaret Dickson, and Duke of Edinburgh. AUGUSTUS G. GREEN, Roselands Nursery, Colchester, beat Mr. THOS. BUTCHER, of Shirley, for 2nd place.

The best collection of eighteen Teas or Noisettes was from Messrs. D. PRIOR & SONS, and generally the blooms were of moderately good quality. The best of the varieties were Caroline Kuster, Madame Cusin, Innocente Pirola, Anna Olivier, Maman Cochet, Marie Van Houtte, Ernest Metz, and Cleopatra. Messrs. FRANK CANT & Co. were 2nd in this case, and included a fine bloom of Madame A. Etienne.

In a class for twelve Roses of one variety, the beautiful and distinct variety Mrs. W. J. Grant gained 1st prize for Messrs. D. PRIOR & SON; and in a similar class for twelve blooms of a Tea or Noisette Rose, the variety Souvenir d'Elise Vardon won 1st prize for Mr. A. G. GREEN, Roselands Nursery, Colchester. Messrs. PRIOR & SONS were 2nd with Souvenir de S. A. Prince.

Thirty-six Roses distinct (amateurs). The Challenge Cup in this class was won by A. SLAUGHTER, Esq., Jarvis Villa, Steyning, the only exhibitor. The blooms staged were small and not so satisfactory as could be wished in a cup class.

In the following class the same exhibitor was again the only competitor, but the general quality of the Roses was rather better.

The best collection of twelve Roses of one variety was from E. M. BETHUNE, Esq., Denne Park, Horsham, showing moderate sized blooms of A. K. Williams.

In the class for twelve Roses distinct from growers of fewer than 2000 plants, the best of three exhibitors was P. G. C. BURNAND, Esq., Hill Grange, Reigate. His varieties were as follows, and the blooms better than might be expected in comparison with less limited classes, Duke of Edinburgh, La France, Gustave Piganeau, Catherine Mermet, Pride of Waltham, A. K. Williams, Rosieriste Jacobs, Dupuy Jamain, Horace Vernet, General Jacqueminot, La France No. 2, and Prince Camille de Rohan; E. M. BETHUNE, Esq., was 2nd.

Among the same class of growers, E. M. BETHUNE, Esq., was 1st for twelve Teas or Noisettes, distinct, the best of these being Comtesse de Nadaillac, Souvenir d'Elise, Anna Olivier, Catherine Mermet, Perle des Jardins, and Madame de Tartas; E. MAWLEY, Esq., Rosebank, Berkhamsted, was 2nd.

The best collection of four Roses, distinct, in trebles, came from P. G. C. BURNAND, Esq., his varieties being Caroline Testout, Gustave Piganeau, Comtesse de Nadaillac, and A. K. Williams; G. MAWLEY, Esq., was 2nd here, and showed good blooms of Tea varieties.

In both classes for growers of fewer than 500 plants, the 1st prize was withheld.

Coming to growers of fewer than 500 plants, the class for six Roses, distinct, was won by W. D. FRESHFIELD, Esq., The Wilderness, Reigate, his best blooms being Grace Darling and Magna Charta; and this exhibitor won 1st also for six Teas or Noisettes, distinct.

LOCAL CLASSES.—For twelve Roses distinct, a new challenge cup was offered to amateurs residing within 2 miles of Croydon Town Hall. This was won by A. C. GIFFORD, Esq., Croydon, South Norwood, who had a creditable collection; and there were two other competitors. The best group of

six H.P.'s distinct, was from M. HODGSON, Esq., Shirley Cottage, Shirley, who won also for the best six Teas or Noisettes.

PLANTS.

The best group of plants arranged in an oval-shaped group 18 feet by 14 feet, came from PHILIP CROWLEY, Esq., Waddon House, Croydon (gr., Mr. J. Harris). This was exceedingly meritorious, the constituent plants being no less remarkable for quality than the disposition of them was tasteful. General stove and Greenhouse species of the choicer kinds with a few Orchids and Cannas in flower were used. The 2nd prize group from C. LANE, Esq., Burntwood, Upper Caterham, had also much to recommend it.

The best and only collection of six Cordylines was from PHILIP CROWLEY, Esq. It included finely coloured plants of Gladstone, Majestica, Regalis, Babbisti. The best Caladiums were from Mr. J. W. Hicks, gr. to C. D. LORD, Esq., Dunearn, Crescent Wood Road, Sydenham Hill, and were moderate-sized plants.

The best specimen plant with ornamental foliage was a magnificent specimen of *Cycas revoluta*, profusely furnished with fronds, and in luxuriant health. The best specimen flowering plant was *Bougainvillea glabra*, from E. H. COLES, Esq.

PHILIP CROWLEY, Esq., had also the only collection of six Exotic Ferns, *Davallia Mooreana* and *D. filijensis* elegans being capital plants. The worthy chairman of the Fruit Committee of the Royal Horticultural Society won 1st prize also for nine Ferns distinct, in pots not exceeding 6 inches in diameter, and he was followed by Mr. G. LEWRY, gr. to Mrs. BLAKE, Duppas Hill.

The best competitive tuberous Begonias were from Mr. W. Sparshott, gr. to Mrs. HALL, Stanton House, Parkhill Rise, in a collection of nice plants. They were very good. This exhibitor had 1st prize for Gloxinias, showing really beautiful and profusely bloomed plants. The best group of Gloxinias intermixed with a few ornamental foliage plants was from Mr. W. Gladwell, gr. to S. SMET, Esq., Werndee Hall, South Norwood.

For a smaller group of miscellaneous plants the 1st prize was taken from two other competitors by Mr. A. DYER, gr. to T. PEACOCK, Esq., Chichester Road, Croydon.

The six most graceful table plants were from Mr. G. Eales, gr. to J. GLAISHER, Esq., Heathfield Road, Croydon; but Mr. C. LANE, gr. to E. H. COLES, Esq., won for twelve plants, showing a very pretty collection.

FRUIT.

Mr. J. FRIEND, The Gardens, Rooknest, Godstone, won 1st prize for white Grapes in three bunches, with Foster's Seedling, not perfectly finished; and Mr. C. BLURTON, gr. to H. COSMO-BONSOR, Esq., M.P., Kingsworth Warren, had the best black Grapes in Hamburg.

Capital Royal Sovereign Strawberries took 1st prize in the Strawberry class for Mr. C. BLURTON, gr. to H. COSMO-BONSOR, Esq., M.P., Kingswood Warren. Mr. O. JEAL, gr. to Miss WATERALL, Waddon Lodge, had the best Cucumbers; and S. OSMOND, Esq., Ottershaw Park, Chertsey, the best Melon, in a medium-sized fruit of Al.

HONORARY EXHIBITS.

Messrs. J. LAING & SONS, Forest Hill Nurseries, London, S.E., had a group of tuberous-rooted Begonias, which faced the entrance to the large tent. The varieties were chiefly double-flowered, and beside creating a fine display, they were individually of much merit.

Messrs. H. CANNELL & SONS, Swanley, also staged double-flowered Begonias, the varieties, Miss M. Mitchell, Mrs. Towers Clarke, pink; Mrs. Norton, pink; Sir J. B. Maple, crimson-scarlet, Dr. Nansen, deep crimson; and Ida Grace, rich salmon; and S. Bryceson, being most noteworthy.

A third exhibit was from Mr. H. J. JONES, Ryeolett Nursery, Hither Green, Lewisham. The choicest of these were Ryeolett Salmon, double; Mrs. G. F. Hall, salmon-pink, double; Miss Clara Walter, double pink; Snowstorm, single; and Mrs. E. Beckett, carnine, single.

Mr. JNO. R. BOX made a grand display of tuberous-rooted Begonias and ornamental-foliage plants in a group of very attractive appearance, his double and single varieties being remarkable for the best quality.

Hardy flowers were shown by Messrs. BARR & SONS, King Street, Covent Garden; Messrs. J. CHEAL & SONS, Crawley; and Mr. J. BOX, West Wickham and Croydon, who had also a group of Gloxinias in pots.

RICHMOND HORTICULTURAL.

JUNE 29.—The twenty-fourth annual exhibition was held amid glorious weather, on Wednesday last, in the Old Deer Park. The Rose classes, open to all exhibitors, were good, there being considerable competition, and the flowers were by no means inferior in quality. The principal class at Richmond calls for a larger number of Roses than any one class at most exhibitions, the one for forty-eight trebles being still retained there. The Challenge Cup offered in this class was secured by the veteran exhibitor, Mr. B. R. CANT, of Colchester. The classes for groups of plants and specimen plants were fairly well filled, particularly the former. There were very fine Orchids shown in competition, as well as by honorary exhibitors. Florists' arrangements, and table decorations, too, were very good, but our limited space forbids us referring to these in detail. Finally, beyond the fruits and vegetables, were vegetables shown by Richmond Allotment-holders, in every sense creditable to the exhibitors.

The Richmond show owed much to the honorary exhibits from the trade.

ROSES.

The 1st class, which called for the enormous number of 144 Roses in forty-eight varieties, was won by Mr. B. R. CANT, Colchester, from several other exhibitors. Accompanying the 1st prize in this class is a handsome Silver Challenge Cup, presented to the Society by its founder. Mr. CANT had a grand lot of blooms in this collection, and especially were the following varieties of excellent quality:—Mrs. John Laing, Hellen Keller, La France, Antoine Riviere, Dr. Andry, Marie Verdier, Lady M. Fitzwilliam, Duke of Edinburgh, Heinrich Schultheiss, Ulrich Brunner, Clara Watson, Madame de Watteville, Mrs. Sharman Crawford, and M. Gabrielle Luizet. A collection from Messrs. F. CANT & Co., also of Colchester, was 2nd, and a close 2nd too, his Roses being bright in colour, fresh, but perhaps embracing rather less substance. But there were some capital trebles in the stand. Messrs. PRIOR & SON, of Colchester, were 3rd.

In the twenty-four treble class, the 1st prize went to Messrs. D. PRIOR & SON, who staged the following varieties in good condition:—Rubens, Prince Arthur, Tom Wood, Marchioness of Downshire, Marie van Houtte, Duke of Edinburgh, Mrs. Sharman Crawford, Dupuy Jamain, Marie Baumann, Mrs. J. Laing, La France, Ulrich Brunner, and Lady M. Fitzwilliam. Messrs. F. CANT & Co. followed in this class. Mr. CHAS. TURNER was 3rd.

The best collection of twelve distinct varieties of Roses in trebles came from Mr. C. TURNER, Royal Nurseries, Slough; the varieties here were Mrs. J. Laing, Marie Baumann, La France, Duke of Edinburgh, Caroline Testout (very fine and large), Gustave Piganeau, Ulrich Brunner, Marchioness of Downshire, Duke of Wellington, Souvenir de President Carnot, Duke of Teck, and Mrs. Crawford; Messrs. D. PRIOR & SONS were good as 2nd prize exhibitors in this class, showing very even, fresh flowers; Messrs. F. CANT & Co. were 3rd.

The best twelve blooms of a H.P. were from Mr. B. R. CANT, who had bright, moderate-sized blooms of Duke of Edinburgh; Mrs. W. J. Grant was the variety shown by Messrs. F. CANT & Co., who were 2nd; and Messrs. PAUL & SON, Cheshunt, were 3rd, with Rev. Alan Cheale.

The best Tea Rose was Rubens, twelve pretty blooms being staged by Messrs. F. CANT & Co.; the delicate tint of this Rose is very charming. 2nd, Messrs. D. PRIOR & SONS, Colchester, with Souvenir de S. A. Prince.

R. E. WEST, Esq., Reigate, won a special prize offered by Lady Ellis for twenty-four blooms in not fewer than twelve varieties; and was also 1st for the prize offered by Sir G. S. Meason, J.P., for twelve Teas and Noisettes.

In the amateur class for twenty-four Roses, distinct, single trusses, and for twelve Roses, distinct, single trusses, the 1st prizes were won by W. ROMAINES, Esq., Old Windsor (gr., Mr. J. Guttridge). In the latter class, J. P. KITCHEN, Esq., Manor House, Hampton (gr., Mr. C. Warwick), was a good 2nd.

PLANTS.

The principal class for a group of miscellaneous plants arranged for effect was won by a beautiful exhibit from Mr. H. E. FORDHAM, The Nurseries, Twickenham. A groundwork of Ferns and other foliage plants was relieved by excellent Gloxinias, Lilliums, Cannas, Cattleyas, Hydrangea paniculata, Tuberoses, Carnations, &c.; and the pretty Gypsophila, used with some liberality, gave a light and pleasing finish to the attractive picture. Mr. M. VAUSE, of Leamington, was 2nd.

The best semicircular group of plants in 60 square feet, in competition for a special prize given by W. Wilson, Esq., was from Sir F. WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. C. Want). Some fine Odontoglossums helped greatly to the pretty effect presented by the group.

Six zonal Pelargoniums were exceedingly good from W. LITTLE, Esq., Baronshalt, East Twickenham (gr., Mr. G. Watts); the plants were about 4 feet across, and extremely well and evenly flowered.

For the Society's prize of three guineas, for a group of Carnations in pots, space not to exceed 50 feet, a very good group of plants of the Malmaison type from A. F. PEARS, Esq., Spring Grove, Isleworth (gr., Mr. Farr), took 1st prize. Most of the plants were one year old, and carried one flower, and in foliage and flower they were very commendable.

The best collection of six plants of show and decorative, as well as fancy Pelargoniums, were from Mr. C. TURNER, Royal Nurseries, Slough, who took 1st prize in each class. W. STACEY, Esq., West Drayton (gr., Mr. John Wiggins), was 2nd, for show and decorative varieties. Mr. Turner's plants were very pretty.

The winner of the class for six exotic Ferns was Mr. Farr, gr. to W. F. PEARS, Esq., Spring Grove, Isleworth, these included a very fine specimen of *Polypodium aureum*, a fine *Dicksonia antarctica*, and *Davallia filijensis*. Mr. Farr also had the best specimen foliage plant in *Asparagus plumosus*.

For the best group of six fine foliage plants, Mr. W. VAUSE, Leamington, won 1st prize, showing two *Codiaeums* and four *Palms*. Coleuses in a collection of six plants were shown well by J. B. HILDITCH, Esq., Asgitt House, Richmond (gr., Mr. A. Meaton); and Caladiums, also in a collection of six plants, by W. CUNARD, Esq., Orleans House, Twickenham (gr., Mr. T. Allsop). The Caladiums were very pretty. 2nd, Mr. Want, gr. to Sir F. WIGAN, East Sheen.

A collection of six *Palms* from V. CUNARD, Esq., Orleans House, Twickenham (gr., Mr. T. Allsop), won a special prize offered by J. D. McDONAGALL, Esq. The specimens were of considerable size and well grown.

The class for six stove and greenhouse plants in flower was entered by only one exhibitor, viz., M. W. VAUSE, and apparently a 2nd prize was awarded the exhibit.

W. H. ELLIS, Esq., Clovelly, Hounslow, had 1st prize for nine Gloxinias, showing in very fine form indeed. For the best six plants of any Orchid species in flower, H. LITTLE, Esq., Baronshalt, East Twickenham, beat Sir F. WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young). Mr. LITTLE's exhibit included excellent specimens of Cattleya Mendell, C. Warneri, very fine, with fourteen flowers, C. Mossiae, C. gigas, Laelia grandis tenebrosa, and Cypripedium Veitchi. In Mr. YOUNG's exhibit were Cypripedium Rothschildianum, Cattleya Mossiae, and C. Warneri, all very good indeed.

Dr. D. H. SCOTT, The Old Palace, Richmond (gr., Mr. R. Johnson), won a special prize for a group of tuberous rooted Begonias, and showed well, the single varieties being best and more abundantly represented.

The best twenty-four bunches of hardy herbaceous cut-flowers were shown by Messrs. BARR & SONS, King Street, Covent Garden. We noticed good bunches of Linaria macedonica, Erigeron glabellus, Calochortus, Iris orientalis maximus, Irises, Heuchera sanguinea, &c. Messrs. PAUL & SON, Cheshunt, closely followed for 2nd place; and Messrs. A. W. YOUNG & CO., Stevenage Nurseries, were 3rd.

FRUIT AND VEGETABLES.

The class for six dishes of fruit distinct was won by Mr. T. OSMAN, Ottershaw Park Gardens, Chertsey. He had Black Hamburgh and Buckland Sweetwater Grapes, Violet Hatve Peaches, Royal George Nectarine, Brown Turkey Figs, and Hero of Lockinge Melon, all of them good in quality; but a close 2nd was W. H. ELLIS, Esq., Clovelly, Hounslow.

The best Black Grapes were from the Earl of ONSLOW, Clandon Park, Guildford (gr., Mr. H. V. Blake), presumably Prince's Black Muscat; and the best white Grapes were Buckland Sweetwater from Mr. THOS. OSMAN.

Mrs. FLACKER, Coombe End, Kingston Hill (gr., Mr. Bolton), had the best Peaches in Stirling Castle; and W. CUNARD, Esq., the best Nectarines in Early Rivers.

In Strawberries, Mr. J. Gibson, gr. to G. H. WATT, Esq., was 1st for two dishes with Royal Sovereign and President; and ANDREW PEARCE, Esq., 1st for one dish with President.

Messrs. SUTTON & SONS special class for vegetables was won by Sir PATRICK TALBOT, Glenhurst, Esher (gr., Mr. C. J. Waite). He showed Early Gem Carrots, Supreme Potatoes, Perfection Tomatoes, Magnum Bonum Cauliflower, White Leviathan Onion, and Duke of Albany Pea; all of these were decidedly good. E. H. WATTS, Esq., Devonhurst, Chiswick (gr., Mr. Jas. Gibson), was 2nd. Messrs. CARTER's special class for nine dishes was also won by Sir PATRICK TALBOT, his produce being equally good in this class.

The Society's prize for the best twelve dishes of vegetables was well won by Sir PATRICK TALBOT, Glenhurst, Esher (gr., Mr. C. J. Waite), the produce being most praiseworthy. The Rev. O. L. POWELL, Woburn Park, Weybridge (gr., Mr. A. Basile) was a good 2nd.

HONORARY EXHIBITS.

Messrs. FROMOW & SONS, Sutton Court Nurseries, Chiswick, displayed a group of Japanese Acers in variety, and a pretty group of stove and greenhouse plants.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, had a large group of Roses in pots, backed by finely flowered plants of Hydrangea paniculata. From Mr. JOHN RUSSELL, Richmond Nurseries, was a beautiful group of variegated and handsome foliaged hardy plants in pots. There was considerable variety in this group, and the plants of which it was composed were individually choice and well cultivated specimens.

Cannas from Messrs. H. CANNELL & SONS, Swanley, were gorgeous. There were about sixty varieties, and staged in a semicircular group they were the prettiest feature in the large plant tent. They were in 5-inch pots, and foliage and flowers were handsome.

Messrs. JACKMAN & SONS, Woking, had a stand of hardy flowers. Mr. W. SPOONER, Arthur's Bridge Nursery, had several boxes of garden and Tea Roses, the pretty little Perle d'Or being very good and abundant.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, staged a group of Orchids, including many of those noticed in another column in the report of the Royal Horticultural Society's show; and Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood Road, London, had their group of Carnations previously noted at the Drill Hall.

A group of greenhouse and hardy plants was shown by Mr. W. THOMPSON, Sheen Nurseries, Richmond. Mr. AMOS PERRY, Winchmore Hill, London, N., had one of the brightest and largest displays of hardy flowers. Messrs. F. SANDER & CO., St. Albans, staged a group of new plants and Orchids, including an extraordinary fine form of C. gigas.

THE GUILDFORD HARDY PLANT CO., Guildford, staged a very pretty group of alpine plants in the form of an alpine garden, the design being carried out very finely. Messrs. R. WALLACE & CO., Colchester, showed Irises, Lilliums, and hardy bulbous flowers; and T. G. FOSTER had a pretty collection of sprays of Sweet Peas. Messrs. BARR & SONS, King Street, Covent Garden, showed hardy flowers.

A capital group of Orchids was shown by HENRY LITTLE, Esq., Baronshalt, Twickenham. This group included very fine varieties of Cattleya Mossiae, Cymbidium Lowianum, C. Rothschildianum, &c., and many other species in excellent condition.

Messrs. T. F. RIVERS & SON, Sawbridgeworth, Herts, had an exhibit of fine and choice fruits, the most interesting being some splendid fruits of the new late Peach, Thos. Rivers, even finer than those shown on the previous day at the Drill Hall. Then there were Apples of 1897, and Apples ripened in 1898; also dishes of choice Cherries, Nectarines, &c.

Messrs. CUTBUSH & SONS, Highgate, London, had a large

group of Malmalson Carnations; and Mr. B. R. DAVIS, Yeovil Nurseries, a group of tuberous-rooted Begonias.

Mr. J. HUDSON, gr. to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, had an exhibit of fruit trees similar to the one he staged at the Temple Show; and some Nymphaea blooms from the same gardens were shown.

THE LEEDS FLOWER SHOW.

JUNE 28.—An excellent display in nearly all the classes was made at the Leeds Show, held on the above date; and the exhibitors having done their part, the only point at issue is the support afforded the Society by the public, which in this, as in every other floral exhibition is essential to ensure the success and continuation of a show of this nature.

FRUIT.

The chief feature in the exhibition was the very fine exhibits of fruit, which, although not extensive, were of excellent quality.

The first in the ten dishes' class was the Earl of HARRINGTON, Elvaston Castle (gr., Mr. Goodacre), whose collection comprised a good example of a Queen Pine-apple, excellent Cannon Hall Muscat and Black Hamburgh Grapes, and a nice dish of Beauty of Bath Apple.

For the best three bunches of Black Hamburgh Grapes, 1st, Mr. GOODACRE, with shapely bunches; 2nd, Lady BEAUMONT, Carleton Towers (gr., Mr. Nicholls); and 3rd, W. SHEEPSHANKS, Esq., Winsley Hurst (gr., Mr. Large).

In the class for three bunches of any other variety of black Grapes, the Earl of ZETLAND, Aske Hall (gr., Mr. Nicholas), was 1st, with good Madresfield Court; 2nd, Sir J. W. PEASE, Bart., Hutton Hall (gr., Mr. McIndoe), with Madresfield Court, having good berries, that were rather lacking in colour.

In three bunches of white Grapes, Lady BEAUMONT (gr., Mr. Nicholls) was 1st, with fine examples of Buckland Sweetwater, having large berries and bunches, splendidly finished; 2nd, W. SHEEPSHANKS, Esq.; 3rd, Sir J. W. PEASE, Bart., M.P.

For six Peaches, the Earl of HARRINGTON was 1st; 2nd, J. D. ELLIS, Esq. Six Nectarines, 1st, Earl of HARRINGTON; 2nd, J. D. ELLIS, Esq., J. P. Scarlet-fleshed Melon, 1st, Earl of ZETLAND; 2nd, W. F. PEPPER, Esq.

For a collection of Tomatoes, six dishes, a very interesting class, the 1st prize was won by Lady BEAUMONT, whose collection had in it fine fruits of Polegate, Challenger, Frogmore Selected, &c.; 2nd, Lord BARNARD, Raby Castle (gr., Mr. Tullett), who showed good fruits of Golden Queen, Golden Jubilee, &c.

GROUPS, OPEN.

The large groups in the open class were arranged generally with much good taste, and the committee is to be commended for providing a large tent with high sides, a point often overlooked. The 1st prize was won by Messrs. R. SIMPSON & SON, of Selby, with an arrangement that was light and full of grace, and containing moreover many good plants; 2nd E. B. FABER, Esq. (gr., Mr. W. Townsend), the group forming a very charming whole, and comprising several nice plants of Cattleya, Odontoglossum, Lillium, and well coloured Crotons; 3rd, Mr. J. S. SHARPE, Almondsbury, with another light arrangement carried out with choice subjects.

GROUPS, AMATEURS.

In these groups exhibitors were confined to within 7 miles of Leeds. The 1st prize in this competition was taken by FAIRFAX RHODES, Esq. (gr., Mr. R. Masou), with an original and tasteful, nicely finished arrangement; 2nd, C. F. TETLEY, Esq., Westwood (gr., Mr. J. Eastwood); 3rd, M. KITCHEN, Esq. (gr., Mr. A. Gamble).

FERNS.

The best six exotic species, 1st, FAIRFAX RHODES, Esq. (gr., Mr. R. Masou).

The best six hardy Ferns, FAIRFAX RHODES, Esq. Pelargoniums, though not shown in great numbers, were of good quality. 1st for six show varieties, Mrs. TETLEY, Westwood.

Three show varieties, 1st, Mrs. TETLEY, Fox Hill (gr., Mr. J. Eastwood).

The best six Fuchsias were shown by Messrs. R. SIMPSON & SON, Selby; and the best specimen greenhouse plant was shown by the Marquis of ZETLAND, and the second best by Mr. J. S. SHARPE; E. B. FABER, Esq., was 1st with a fine specimen Cycas.

The best six ornamental foliage plants were those from the Marquis of ZETLAND's garden; and the second best from Messrs. R. SIMPSON & SON, Selby. The Marquis of ZETLAND had the best six stove or greenhouse plants.

For six Orchids in flower, 1st, E. B. FABER, Esq. (gr., Mr. W. Townsend), who showed a capital piece of Cattleya Mossiae, a good Odontoglossum crispum among others; 2nd, Mr. R. EICHEL, Bradford; 3rd, Mr. J. SUNLEY, Monk Fryston.

For a specimen Orchid, 1st, Mr. J. W. MOORE, Rawdon; 2nd, Mr. R. EICHEL; 3rd, E. B. FABER, Esq.

Gloxinias were very fine indeed, good plants in handsome varieties being in evidence. The 1st prize for six plants went to C. J. RUSHWORTH, Esq., Horsforth (gr., Mr. T. Smith); 2nd, S. WHITAKER, Esq., Horsforth (gr., Mr. B. Mollett).

ROSES.

Roses were fine in quality, and in fair numbers. In the class of forty-eight distinct varieties; 1st, Messrs. DICKSON & SONS, Newtownards, whose collection included splendid blooms of The Frigate, Liberty, Catherine Mermet, Ulster, and Rubens.

Messrs. HARKNESS & SON, Jedale, showed good examples of La France, Capt. Christy, Merry England, &c.

All the other classes of Roses were well filled with good varieties and excellent blooms.

Cut flowers were very well shown in bouquets, the chief prize-winners being Messrs. PERKINS & SON, of Coventry.

The Committee did wisely in having as a judge for the bouquets and hand-baskets the Lady Mayoress of Leeds, Mrs. C. F. TETLEY, who most kindly offered to award the prizes, and in so doing gave great satisfaction.

Messrs. CLIBRAN, of Altrincham, exhibited a grand collection of Pæonies, including some good blooms of the up-to-date varieties; these were interspersed with cut herbaceous flowers and decorative plants.

Mr. A. J. HALL, of Harrogate, exhibited (not for competition) a charming stand of cut-flower devices, which included some very original and beautiful combinations of colour, and showed great taste.

The show was opened by the Lord Mayor of Leeds (C. F. TETLEY, Esq.); and Mr. CLAYTON, in responding to the toast of "The Judges," at the subsequent luncheon, expressed the wish that the fine weather which had favoured the opening might encourage the Leeds citizens to attend the show in numbers, and so ensure the success of what was undoubtedly a very fine exhibition.

PLANT NOTES.

TOCOCO FORMICARIA.

PLANTS of this interesting Melastomad were exhibited at the last Ghent Quinquennial by M. Linden, under the name of Miconia vesicaria, and one of them has recently been kindly presented by M. Linden to Kew. The genus Tococa comprises some thirty species of tropical shrubs, all natives of South America. In general characters they resemble the familiar Cyanophyllum, but they differ in having smaller, hairy leaves, and, in regard to the majority of them, in having a pair of bladder-like projections on the petioles or at the base of every leaf-blade. In some of the species these "bladders" are an inch long, and nearly as much in diameter. T. formicaria is a shrub 4 to 6 feet high, with opposite lanceolate leaves, 8 inches long and 2 inches wide, glossy-green, and covered with short, erect, soft purplish hairs; the bladders are as large as Horse-beans, green and hairy, entrance to them being through a pair of holes at the base of the midrib on the under-side of the leaf. It is supposed that these bladders serve the same purpose as the large hollow spines on the bull's-horn Acacia, namely, as an abode for ants, which in their turn protect the plant from browsing and other enemies. Whatever their use they are very remarkable in appearance, and the plant is worth a place among stove-shrubs on this account alone. W. W.

LAW NOTES.

IN BANKRUPTCY.

Re THOMAS FOX, FLORIST, PENZANCE.

The above-named debtor appeared for his adjourned public examination at the Truro Bankruptcy Court recently before the Registrar. Replying to questions put by the Official Receiver, the debtor denied that he neglected his business in order to go about the country as a local preacher. He always understood that flower-growing was a very profitable thing, and that it was not necessary to know the business. After he went into the business he discovered that he had made a mistake, and the result of his trading was, that he had been brought to his present position. He could only say that his deficiency of £1400 had gone in payment of bills, and for labour done. He had had one transaction with a money-lender. He borrowed £20 10s., and signed a promissory-note for £26 10s., to be paid at the rate of £5 per month. He paid one instalment of £5, and had a writ served upon him for the balance, incurring a further charge of £3 10s. The debtor was eventually allowed to pass his examination.

TRADE NOTICE.

THE firm of W. L. Lewis & Co., Orchid Importers, of Southgate, London, has been dissolved. The business will in future be carried on by Messrs. Stanley-Mobbs & Ashton at the same address.

KIRKE'S PLUM.

I FIND this Plum generally takes high rank as a dessert variety on the exhibition table. It is universally acknowledged to be one of the most delicious Plums in cultivation, and it came to my notice the other day that in a large garden where Plums are extensively grown, Kirke's has good crops, but on the wall and in the open as standards, the same could not be said of any other variety. Probably its hardy character and vigorous growth may account in some measure for its fruitfulness in a season when the Plum crop is quite scarce in many places. Though Joseph Kirke's name will go down to posterity as associated with this Plum, he did not raise it, though he did a great deal in the direction of getting it cultivated. It has been in cultivation many years, as I find it in a list of Plums published in 1817. Kirke died in 1864, at the great age of 96 years. Dr. Hogg states in his *Fruit Manual* that this Plum was first introduced by Joseph Kirke, who had a nursery of 6 or 8 acres of ground at South Kensington, which was in part surrounded by the walls of Cromwell's garden, and occupied a part of the site of the present Natural History Museum; and from this nursery came many of the trees which were planted in the orchard of the old Chiswick garden. He used to exhibit from this nursery at the early meetings of the Royal Horticultural Society, collections of Apples and Pears, and was a regular attendant at the meetings. Kirke once stated that he first saw the Plum which bears his name on a fruit-stall near the Royal Exchange, and that he afterwards found that the trees producing the fruit were in Norfolk; he found them out, obtained grafts, and propagated it, thus bringing it into cultivation. Dr. Hogg's account of what he terms its true origin was in the grounds of Mr. Poupart, then a market-gardener at Brompton, and about the spot occupied by the lower part of Queen's Gate, where it sprang up as a sucker to a tree which had been planted to screen a building.

The name of Kirke is also associated with several Apples, such as Scarlet Admirable (a synonym of Hollandbury), Golden Reinette, Lemon Pippin, and Lord Nelson; though it is doubtful if he actually raised any of them—certainly not Lemon Pippin, as mention is made of that variety about the middle of the eighteenth century, and was in cultivation, no doubt, many years before. Kirke retired from business about 1845, and became an inmate of Huggin's College at Northfleet, where he died. In the early part of the present century, Brompton was famous for its well-cultivated nursery-grounds and gardens, and they are not quite extinct yet. R. D.

THE ROSARY.

ROSES IN SCOTLAND.

MANY rosarians in the South may be glad to hear how the northern Roses have fared, and what are our prospects in regard to the flowers. To this end I have cut out of the *Scotsman* of June 21 "R. M. O. K.'s" timely remarks and useful hints. It is also a good omen for a great extension of Rose-culture in the North, for which there is ample room, to find the *Daily Scotsman* discussing the season of Roses, under the yet bolder heading of "Science and Nature." D. T. Fish, 12, Fettes Row, Edinburgh. ["R. M. O. K." in our contemporary, after discussing much that applies to Rose-culture in all parts of these islands in the matter of planting, manuring, pruning, selection of varieties, enemies of the Rose, and endorsing the general lament that Maréchal Niel is too tender for Scotland, gives his opinion of the present as a Rose season. He says "It has up till now been a bad Rose season. The early spring growth, strong and vigorous, was arrested by the frosts and cold winds of April and May, with the result that generally the plants have a shrivelled and unhealthy appearance. As a further consequence of this long-continued check, the bushes are infested with green-fly and Rose-grub. In the West of Scotland these unfavourable conditions are only present

in cold, exposed situations, and flowers will not be much behind the average; but in the East, except in protected localities, there is every likelihood that the Rose will this year be a failure." ED.]

Obituary.

PROFESSOR FERDINAND COHN.—This distinguished botanist died suddenly at Breslau, on Saturday, June 25, of heart disease. He was born in 1828, and obtained the chair of botany at Breslau University in 1859, in succession to Dr. Goepfert. His best-known work is entitled *Die Pflanze*. In recent years he had laboured with success in the field of bacteriology, and he wrote a book on *The Development of Microscopic Algae and Fungi*, showing the destructive action of parasitic fungi and bacteria. —*Times*.

MARKETS.

COVENT GARDEN, JUNE 30.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

baskets	1 6-3 6
— Kent, pecks	3 0-6 0

REMARKS.—The small quantity of big Asparagus was in great request to-day. Peas are coming on fast, and will, with the present sunshine, fill out rapidly, and prices may be expected less before the close of the week. Cherries are coming on; some Black-heart at 4s. per sieve of 24 lb., which is the recognised weight, were very good, bright, bold, sound fruit. The supply of foreign vary a good deal, and some are very good, and the prices vary according to package, &c. Some splendid Pines are now coming, more of the Queen shape, but I am not able to decide the sort. Strawberries have shown the lack of sunshine in poorness of colour, but they may now be expected to come on fast; and I am informed that crops are good, as are also those of Cherries. Of course, fine weather has a marked influence on the ripening of these last two fruits. The supply of Gooseberries not being very heavy, prices have improved, but not very much, seeing 2s. 6d. is the top price.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

POTATOS.

Kidneys, 6s. to 7s.; Cherbourg and St. Malo, 5s. 6d. to 6s.; home-grown, 6s. to 10s. per cwt. Old Potatoes, 110s. to 120s. per ton. John Bath, 32 and 34, Wellington Street, Covent Garden.

SEEDS.

LONDON: June 29.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the seed trade, as might be expected, is now quite stagnant, to-day's market being bare of both buyers and of business. Offers of new French Trifolium are coming to hand. Full prices are asked for Mustard and Rapeseed. The sale for Bird seeds is at present meagre. As regards Blue Peas and Haricot Beans there is no movement either in value or demand. Linseed is also quiet.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending June 25, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending June 25, is furnished from the Meteorological Office:—

"The weather during this period was very unsettled and rainy in Ireland, Scotland, and the north of England. In the south and south-east it was fine and dry during the earlier half of the week, but towards its close the rainy conditions extended to those districts also. Thunder and lightning occurred from time to time in most parts of the kingdom.

"The temperature was slightly above the mean in 'England, N.E. and E.,' the 'Midland Counties,' and 'England, S.,' and just equal to it in 'Scotland, E.,' 'England, S.W.,' 'Ireland, S.,' and the 'Channel Islands,' but in the remaining districts it was a little below the normal. The highest of the maxima were recorded during the earlier days of the period, when they ranged from 79° in 'England, S.,' and from 74° in 'England, E.' and the 'Midland Counties,' to 69° in 'Ireland, N.,' and 66° in 'Scotland, N.' The lowest of the minima, which were registered on the 22nd in Scotland, and on the 23rd in Ireland and England, ranged from 49° in 'Scotland, E.,' to 48° in 'England, N.W.,' and to 50° in the 'Channel Islands.'

"The rainfall was more than the mean in nearly all districts, but was only just equal to it in 'England, E.' and the 'Midland Counties,' and was rather below it in 'England, S.' In the northern and western districts generally the excess was either very large or considerable.

"The bright sunshine was deficient in all districts excepting the 'Midland Counties.' The percentage of possible duration ranged from 38 in the 'Channel Islands,' 37 in the 'Midland Counties,' and 35 in 'England, E.,' to 25 in 'Ireland, N.,' and to only 13 in 'Scotland, N.'"

AN OLD SLUG AND WORM-INFESTED KITCHEN GARDEN: R. M. The heavy dressings of gas-lime in the autumn, followed by deep trenching, and leaving the surface rough, will do much to sweeten the soil, destroy slugs, wire-worms, and cause the disintegration of the excessive amount of nitrogenous matter in the soil. This trenching should be followed in February by a heavy dressing of quicklime which should merely be dug into the soil one spit deep, and all sowing and planting be postponed for one month at least. No stable or other manure should be applied to the land for the first season, but if found necessary for pushing on certain crops suitable artificial manure may be afforded. The next year the land should be trenched two spits deep, that which is the middle spit (2nd) being brought to the top, and the next year the spit at the bottom of the trench that was first thrown down may be brought to the middle position. A moderate amount of quicklime may be applied to such parts of the soil as have not been dressed.

BOOKBINDER: A. G., Lower Edmonton. Mr. Zaehnsdorf, Cambridge Circus.

GRAPES: H. G. Your Grapes are badly spotted; we fear it is too late to do anything, but you might try syringing them with liver-of-sulphur, 1 oz. to 1 gallon of water. Remove every spotted berry and burn it.

INSECT: W. T. The beetle in your Dahlias is one of the weevils, *Ornithorhynchus picipes*. There is also a green caterpillar, which we cannot name.

LONG-HANDLED SHEARS: H. Either way of using is right.

MUSHROOMS: J. Gachelin. The bed, as you say, may be filled with spawn; but how do you know that it is living spawn now? It may have exhausted itself in running in the bed, and from lack of heat, moisture, or nitrogen, have failed to produce a Mushroom. We should not suppose that you will gather true Mushrooms from it after this lapse of time. Better start anew.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—R. A. *Astrantia major*.—J. T. *Lælia grandis tenebrosa*.—L. P. 1, *Leucothoe axillaris*; 2, *Spiræa Lindleyana*; 3, *Polygonum complexum* (?), no flowers; 4, *Cornus sibirica*; 5, *Hippophae rhamnoides*; 6, *Polygonum cuspidatum*. W. G. 1, *Inula glandulosa*; 2, *Hibiscus sinensis* (*Althea frutex*); 3, *Anthericum lineare variegatum*. T. D. *Limnantes Douglasii*.—W. T. B. 1, *Oncidium flexuosum*; 2, *Ixora coccinea*; 3, *Bambusa Fortunei variegata*; 4, *Goldfussia* (?), send in flower; 5, *Clorodendron squamatum*; 6, *Carex variegata*; 7, send in flower; 8, *Maranta Makoyana*.—J. H. *Ixia*, one of the garden forms.—G. Dance. *Tamarix germanica*; a shrub much planted at our seaside resorts.—J. W. *Barbarea vulgaris*, double flowered; *Allium Moly*.—J. H. B. *Eucalyptus globulus*.—M. A. 1, *Cratogeomys Aronia*; 2, *Ulmus campestris*; 3, *Cornus sanguinea*, common Cornel.—A. W. *Lophospermum scandens*.—W. J. W., Carlisle. *Hordeum jubatum*.—W. P. *Odontoglossum Coradinei*, a natural hybrid of *O. Lindleyanum*.—J. D. B. 1, *Calycanthus fragrans*; 2, *Cypripedium Parishi*; 3, *Dendrobium clavatum*.—R. T. N. Both the *Cattleya Mossiae* and *C. Warscewiczii* (gigas) are good varieties, but not sufficiently distinct to be of extraordinary value.—A. L. P. *Dendrobium moschatum*.—Rascher. *Ægopodium Podagraria* (Goutweed, British).—Rev. W. G. P. The cut-leaved Lime, a garden variety.—A. W. B. *Heracleum giganteum*.—C. H. W. *Stachys lanata*.—G. S. *Abelia triflora*.—Flowers secured to luggage-labels. 1, *Inula glandulosa*; 2, *Campanula glomerata*; 3, *Erigeron caucasicus*; 4, *Sedum tortuosum variegatum*; 5, *Poa trivialis variegata*; 6, *Phalaris arundinacea variegata*.—Nevé Brothers. *Veronica pinguifolia*. J. McL. 1, *Pernettya mucronata*; 2, *Olearia*? next week.—*Tempus Fugit*. 1, not found; 2, *Strobilanthes Dyerianus*; 3, *Anthericum lineare variegata*; 4, *Erica obbata*; 5, *Erica ventricosa coccinea minor*.—K. & T. *Salvia sclarea*.

PEACHES: *Anxious*. The fruits sent have the appearance of being at some earlier period attacked

in a slight degree by mildew. The effect has been to arrest the extension of the skin at some places, which then, under pressure of the sap, bursts. You can do nothing now, but you ought to guard against an attack another year by using some of the recommended antidotes.

PEAS: J. D. See reply to "Cymro" in our issue for last week.

ROSE: J. Chapman & C. Pearce. We cannot undertake to name varieties of the Rose; send it to some large grower of Roses.

SEEDLING CARNATION: H. E. In form as good as its parent, Miss Jolliffe, and in colour a rich shade of crimson. Certainly worthy of being preserved, either as a border, or winter-flowerer under pot-culture.

SOLANUM JASMINOIDES: E. T. M. Would be hardy against a wall in mild winters, or with very little protection. It is hardy in the Isle of Wight.

SPOTTED PELARGONIUMS: Long. The spots on the leaves are due to a fungus (*Ramularia geranii*). The foliage is disfigured, but otherwise the disease should not be serious, and with care is easily got rid of. The remedy is spraying with Bordeaux Mixture in the "modified" form, described in this paper in August, 1897. Spray frequently this season, and burn the leaves as they fall or become much discoloured. Look carefully after next season's plants to have them hardened off before planting.

STRAWBERRY CULTURE IN POTS: W. F. V. S. The runners should be now rooted on small squares of turf that has been a year in stock, or in 3-inch flower-pots, with one hollow piece of crock at the bottom, and filled with a similar kind of loam, made very firm by hand. Read last week's calendar for "Fruits under Glass," and con this calendar from time to time for hints as to treatment. You would be enabled to pick early fruit say in March and onwards from plants placed on the two upper shelves of your glasshouse. The description of Strawberry culture in pots is too lengthy for us to insert in this column.

TOMATOS: Subscriber. Undoubtedly attacked by a fungus, probably *Peronospora*, but we cannot be sure from a cursory glance. There are so many fungi which attack the Tomato. Try syringing with weak Bordeaux Mixture, or with liver-of-sulphur, $\frac{1}{2}$ to 1 oz. to a gallon.—Cheshunt. Probably a form of the "Sleepy Disease," described by Mr. George Massee, *Gardeners' Chronicle*, vol. xvii. 1895, p. 707. No cure. Clear out root, top and soil, and char the whole of these.

VINES: A. R. N. Keep the heat at not less than 60° at night, and 75° to 80° by day, and afford air more or less in volume according to the weather. This matter will require unremitting attention on most days, as changes are frequent, and the thermometer should be constantly consulted. Do not syringe the Vines, but maintain moisture in the air by wetting the paths and border several times on fine days, scarcely at all on dull ones, and do not close the house at any time unless more or less humidity be afforded. Buy a manual on the Vine.

VINES NOT FRUITING: A. B. The shoots sent have a most impoverished appearance, and we should suppose that from some cause or another, the Vines have lost their chief feeding-roots. Examine the border in several places, near to and distant from the Vinery, and send us samples of the roots and the soil, both from near the surface and 1½ to 2 feet deep.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE Gardeners' Chronicle.

SATURDAY, JULY 9, 1898.

THE CHRONICLE OF A LITTLE CORNISH GARDEN.

NE.—Of course, I am more interested in my young Rose-bushes than in any of other plants now glorious. Not that I have sympathy with that gardening system which has the exhibition-table ever ahead, of which Rose-growing is but too often an example. The Rose, however, is so full of variations, both literary and personally reminding, that it must always possess an interest far beyond that which its beauty would afford. For, great as is the beauty of the Briars and some other single-flowered species, as graceful as is the natural habit of their growth, I fail to see either any special beauty or form possessed by the mass of hybrid-perpetuals, or the smallest element of grace in their habit as usually—and to some extent forced—grown in the garden. They frequently afford an example of the lust of the market (who is sometimes but a market-gardener who has missed his vocation) for substance and size at all costs. Nevertheless, I grow a fair number, and, as I have said, am especially interested in them, but not, I fancy, from the same point of view that I admire the beautiful buds of Madame Bérard, the exquisite flowers of the Red Damask (one of the most deliciously-scented and delicately-coloured of Roses), or the free growth and abundant clusters of white flowers of Félicité-Perpétue, which is a post-by strides and bounds. There is, however, one characteristic which gives the Rose a special interest and value, and that is, its practically general possession of fragrance. This is not generally recognised in thinking of the Rose, and the peaking of the Rose's scent is its heterogeneity. Scarcely two Roses smell exactly alike, and whole classes are marked off by their distinct odours. Moreover, it is not the flowers alone which are thus characterised, but in many cases the foliage also. This shows itself especially in the case of the Briar and the valuable hybrids derived from it. Every garden should find room for one of these sturdy Penzance Briars, and I will certainly plant more varieties next autumn. In November I planted two kinds—Anne of Gevestein and Lady Penzance, both of which are already borne dozens of flowers—the former dark crimson, the latter, as one would expect from its ancestry (its parents are Sweet William and Austrian Copper), a beautiful copy-yellow, with stamens of clear gold. These have proved themselves very vigorous, the former as a climber, and the other as a bush, with delicately-scented flowers of great beauty, and with the scented foliage of the Eglantine, which are, I believe, less than twenty varieties, and that a complete collection can easily be obtained and grown. Although but a summer plant, and, therefore, not long in flower, its

foliage will yield sweet odour, and its hips beautiful colour for some months.

It is in their habit of autumnal as well as summer blooming that the Tea Roses are so valuable. The same, of course, applies partially to most of the hybrid perpetuals; but for the most part their blooms are so massive and stiff that their artistic value is not comparable with that of the more loosely-arranged and fragile Teas. The Teas I have found to be the first to flower; and I mean to plant several along a rough trellis I have just erected, in order that I may enjoy these Roses and other plants grown freely and naturally. Three of the best Tea Roses for a beginner to start with are Madame Bérard, Gloire de Dijon, and Belle Lyonnaise, all of which are hardy and vigorous, and all beautiful.

In addition to those Roses I have named, I am especially pleased with *R. spinosissima*, the Burnet Rose, with characteristic bushy habit, and bearing hundreds of fragrant little creamy flowers; *R. Brunonis* and *R. moschata*, two single white Roses with yellow anthers, both vigorous climbers; and the fine white hybrid Moss-rose *Blanche Moreau*.

I referred to the too vigorous growth of the *Silene* which carpeted my Rose border. I was at length obliged to pull it up in its entirety; nor was I too soon, for it had already killed one of my small Teas and a little China Rose-bush. I shall, of course, try another carpet, to avoid the winter and spring bareness, which is the usual property of Rose-borders, but shall use either Primroses which bloom early, or Violas which bloom continually; in any case, however, employing plants of strictly dwarf habit.

I have two really fine masses of colour. The most brilliant is afforded by my *Escholtzias*, now at their extreme of beauty; the other is given by some hundreds of *Bride Gladiolus*, a charming flower much grown in this district for the cut-flower market.

I mentioned the fact that I have just fixed some rough trellis that I may enjoy the free growth of Rose and Clematis, *Choisya* and *Jasmine*, *Ivy* and *Honeysuckle*; and also to afford additional shelter from winds and overlooking eyes. As I cannot do much permanent planting until the autumn I have sown some *Scarlet Runners*, *Nasturtiums*, *Sweet Peas*, and *Canariensis*, that the trellis may be temporarily draped until such time.

This trellis will necessitate, or rather give tempting possibilities of, some new arrangements in my garden scheme; and I have been deriving infinite pleasure from the consulting of catalogues, and the making of lists and plans. What tempting publications the florist's catalogues are! How many million hours have they filled with happiness, cheering the gardener with hopeful dreams and visions of loveliness which he may never realise (or may)? A collection of these catalogues almost constitutes a complete gardening library, and an encyclopædia of present day horticultural science.

When we have Barr's Daffodil catalogue, Backhouse's, Ware's, and Barr's lists of hardy perennials, Kelway's Catalogue of *Pæonies*, *Delphiniums*, and *Gladioli*, Douglas's *Carnation* booklet, Sydenham's lists of *Pansies* and *Violas*, Sutton's "Amateur guide to horticulture," and the general catalogues of Dickson of Chester, Dobbie of Rothesay, Cannell of Swanley, and Smith of Worcester, we are on the fair road to happiness—and an empty pocket. Then again consider the Rose-lists of the Pauls, Bunyard, Rivers, and the rest, and admire the fortitude

of that man who can keep his pen from his cheque-book whilst he has a spare yard in his garden. Now that I have this trellis to plant, and some new beds and borders to arrange for, I consult the catalogues with absurd persistence, and, as it appears to others, childish enthusiastic interest. I take three or four catalogues in the trap when doing my rounds; I prop a catalogue against the cruet and one against the bread at breakfast. I mark, copy, and compare them; I draw up repeated lists, and alter and modify them beyond recognition.

In sober truth, it would be difficult to offer the gardening novice better advice than that given me many years ago by an old friend, Dr. Francis Mead (whose pen, during his short adult residence in England, was often used for the gardening press). I asked him what book he advised me—a gardening ignoramus—to read dealing with open-air flower-gardening, and he gave me this list:—Robinson's *Hardy Flowers*, Sutton's seed catalogue, Barr's catalogues of bulbs and hardy perennials, Ware's set of catalogues, and Smith's and Kelway's general lists.

These catalogues mean great labour and much cost in their production, and they should be carefully preserved. For the most part, they contain accurate descriptions of the plants named, together with an account of their appropriate soils and treatment, as well as numerous illustrations—often artistic productions of considerable value. The illustrations—mainly photographs—which accompany some of the recent catalogues of Barr and Ware, are very far removed from the stiff plain or glaring coloured prints which nurserymen formerly employed. It is unnecessary to say that we should send at least an occasional order in return for the pleasure and profit obtained in this way. It is unnecessary simply because the usual difficulty consists in preventing oneself from ordering the lot.

Among other things which my new arrangements for the autumn include, is a definite bed of good self-coloured Carnations, instead of the rather scattered system of growing them which I have heretofore adopted. It is not advisable to mix Carnations with strong-growing plants, and therefore I intend giving them a bed to themselves. I propose, however, to plant a few dozen clumps of Daffodils among them to brighten the bed in the spring; but as the foliage of the *Carnation* is pleasant all the year, I do not anticipate any bare effect, and the lovely flowers are in any case worth a little sacrifice.

At present the Pinks are acting as the Carnations' forerunners, and very beautiful they are. The old white Pink is not easily to be beaten, either from the point of view of beauty, scent, or sturdy habit. Of the singles, I have been most pleased with the rosy Cheddar Pink, which I have planted on the edge of a dry bank; and the more deeply-coloured alpine Pink, which requires a moister situation. I must not forget another *Dianthus*, now coming into flower, and that is the old and ever admirable and admired Sweet William (what a stupid corruption of the original pretty name "Eillet!"). I have a mass of the strain called *Auricula-eyed*, the flowers of which have white eyes, surrounded by rings of various rich colours. Few plants are easier to grow, or better worth growing. The Spanish Irises have been splendid, the flowers being finer than last year, although the bulbs have not been moved for three years. Now that they can be bought so cheaply, no one need be without this most beautiful of all

ored, if stored it could be called, for the Apples are shot down upon the bare boards of the floor, just as they came from the orchard, there they lay, large and small, sound and unsound, mixed with leaves and broken-off spurs from the trees, and though we had experienced sharp weather, and the snow was still lying on the north sides of the lanes, yet in no way covered or protected.

I waited for my friend to make the first remark, but as he kept silence I asked, "Tell me, please, if this is a fair sample of what you sent up to market?" "Ye-es," he said, "I sent my chaps up with the baskets and a malt shovel (made of wood), and they filled the baskets from the heap, and left it just as you see it, so it must be a fair sample what you see left."—"Then I am not surprised," said I; "you got back only 28 pence, but I wonder you got even so much!" This only elicited a grunt; and at my suggestion we descended the step-ladder, and went to look at the so-called orchards. These were more depressing to look at if possible than the fruit; the trees were planted in rows, but too thickly by half, and seemed to have been left to Nature after they were planted. The branches were crossing and inter-

Feeling therefore there is need, I propose, with the Editor's permission, to write a series of articles on hardy fruits, their varieties, proper culture, and best method of marketing.

By hardy fruits I wish to indicate only such as can be grown without protection of glass or a wall, and the few that can be successfully so cultivated will be found indigenous to Britain, with the exception perhaps of the Breda Apricot, and possibly the Quince, and among Nuts, the Walnut and Chestnut. I propose to divide the subject into three popular divisions, hard fruits, soft fruits, and berries. The first embracing Apples, Pears, and Quinces; the second, Plums, Cherries, and other stone fruits; and the last, Strawberries, Raspberries, Gooseberries, and Currants.

I begin with the Apple, the monarch among fruits, all crowned, but some having as many, and some more crowns than the Pope of Rome, certainly the most important of all, looked at from a food point of view. I have heard an old nurseryman say, "that with flour cheap, and an abundant crop of Apples, the poor cannot starve," but he probably forgot the item of suet, and margarine had not then been invented!

"sharp" cider; one produces a fragrant, limpid drink, another gives a flat and turbid cider. There is, according to the United States Consul at Havre, still another kind of ferment, consisting of an aggregation of microbes, commonly known as "mother of vinegar," which, when introduced into cider transforms it into vinegar.

In selecting the Apples care should be taken, for to make good cider it is above all necessary to have the proper kind of Apples. To sum up the qualities needed to produce good cider, it may be stated that the fruit should be ripe and fragrant, averaging from two to four per thousand of acidity, containing with some mucilage a notable quantity of tannin (3 or 4 per cent.), and a large proportion of saccharine matter, say 15 per cent. In gathering the fruit, care is taken to protect the Apples against mud or other extraneous substances, which, if introduced into the must, retards fermentation, and impairs the quality of the cider. All rotten Apples are rigidly excluded, as it is contended that a few rotten Apples will affect the flavour of the cider. The fruit being carefully selected, the next step is to thoroughly crush it. After crushing the Apples the usual practice is to place the pulp in uncovered vats or tubs, and leave it twelve or fourteen hours before pressing, stirring it meanwhile from time to time with wooden shovels in order to bring the mass into contact with the air.

The modern cider-press consists of a circular cage with a bottom on which the pulp or mashed Apples are placed, and then pressed by means of a screw—at first slowly, then progressively until the operation is completed. When the pulp has been thus drained, it is taken out and placed in vats or tubs, where it is macerated with a certain quantity of water, say two or three gallons of pure soft water to 100 lb. of pulp, for twenty-four hours, after which it is subjected to a second pressure. In this way, from every hundred-weight of pulp, several gallons more of cider are obtained. The expressed juice of fruit, known as the must, having been placed in barrels, the next step is to obtain proper fermentation, the most delicate and troublesome process in the making of cider, and at the same time the most important, since upon it depends the quality of the product. The fermentation of cider differs essentially from that of wine. In the case of wine, all the sugar ought to be completely transformed into alcohol by the ferments or fermentative microbes, which play such an important part in this process. For cider, on the contrary, it is necessary that fermentation be promptly established, and last only a short time, in order that the must may be clarified before the sugar has been entirely transformed into alcohol. The sugar which remains after the first active fermentation will still maintain a slow fermentation in the cider, which prevents it from becoming too acid and being transformed into vinegar. There are three conditions which largely influence fermentation, viz., temperature, aeration, and the acidity of the crude juice. Temperature plays an important rôle in the process of fermentation. At 32° Fahrenheit fermentative germs cease to multiply and become inactive; at a temperature of 130° to 140° many of them die. It is between 68° and 78° that they are most active. If therefore the temperature is too low, it will be necessary to warm the must in order to accelerate fermentation. This is done by heating a small quantity of the fluid to about 135° or 140° Fahrenheit, and then pouring it into the barrel. In France a specially-constructed warming apparatus (*chauffe-cure*) is used for this purpose. As regards aeration, oxygen is an essential element in the process of fermentation, and it is therefore necessary that the must be thoroughly aerated. The liquid is stirred from time to time, and a quantity drawn off now and then and returned to the barrel; the bung-hole is left open or stopped with a little cotton-wool, which admits the air, and at the same time excludes any injurious microbes that might find their way into the barrel. In spite of all precautions, it sometimes happens that fermentation is retarded. This is the case when too many sour Apples have been used, the result being an acid must. Some persons neutralise the acidity by throwing a handful of wood-ashes into the liquid, and then agitating it; but the best makers think this manner of treating the must is apt to produce a flat cider without colour, and is, therefore, not to be recommended. They say it is better to avoid an excess of acidity by a proper choice of fruit. One means of increasing fermentation, much used by the French cider-makers, is to add a small quantity of must made from the best Apples, to the indifferent must, which acts as a leaven to produce fermentation. The ferments of good fruit, thus added, set immediately to work and multiply the fermentation germs

FIG. 7.—BOTANIC GARDEN, YORKSHIRE COLLEGE LEEDS. (SEE P. 24.)

lacing, more like those of a primeval forest than a cultivated plantation, while the branches were covered with moss and lichen.

To my enquiry "How often are the trees pruned?" I got this answer, "Oh, when my chaps can't do anything else I send them here with an axe, and they chop out the dead branches; but I didn't know they wanted any other pruning!" "My dear sir," said I, "the orchards and plantations in Kent are pruned and attended to by a skilled workman every winter; for it is only by allowing light and air to get to your trees that they will become early fruitful, and produce such samples of fruit that your salesman will accept them and remit you a fair price." "What must I do, then?" "My advice," I returned, "is to cut at least 100 large faggots or more out of each orchard, mostly from the middle of the trees" (I should like to have said fell every other tree, but dared not), "lime-white the trunks and thick branches, and next year (this was late in November) you may, perhaps, grow a little good fruit." I left my friend looking very downcast, and did not see his jovial face again at any of the lectures, and I have grave doubts whether my advice-gratis was put into practice; and although his good wife had prepared a luncheon for me, I had given such offence by my "straight tips," that I was not even asked to partake of the hospitality.

while probably he not even dreamt, though he had exported scores of trees there, of ship-loads of fine Apples coming from the Antipodes and from North America, so that there is now no perceptible interval between the last of our late Apples and our earliest into the markets, not fully bridged over by fine fruit from abroad. *Experience.*

CIDER-MAKING IN FRANCE.

It may be well to state, before describing the several processes of cider-making, that the quality of the cider will depend to a great extent upon the proper fermentation of the must or crude juice of the Apple. So fully is this recognised that it has given rise to the French proverb, "No good cider without good fermentation and good ferments." Several days after the must is placed in barrels, a sort of ebullition is produced in the mass, bubbles of carbonic acid are disengaged, foam or froth rises to the surface, and the lees or dregs of the juice settle to the bottom; finally, the must loses its sweet taste, the sugar which is contained being converted into alcohol. This disturbance or transformation is produced by microbes, which, seen under the microscope, have the appearance of small cells. These are the ferments. There are different kinds of ferments, as there are different kinds of Apples. One will produce a sweet cider, another a dry or

so rapidly, that the deficiency in the must to which it has been added is soon overcome, and a fresh and complete fermentation takes place. In like manner, a good cider may be destroyed by the addition of a bad ferment, often unwittingly added, by not taking care to thoroughly clean the instruments and vessels employed in the fabrication of the cider. In France, an artificial leaven, made from Apples of the best growth, is an article of commerce, and is much used to correct deficiencies in must of a poor quality. A quart of this leaven, costing about 4s., will serve to improve from 130 to 140 gallons of an indifferent must. This leaven, or artificial ferment, has been used with very satisfactory results for several years, and is apparently growing in favour with large cider-makers. After ten or fifteen days the fermentation ceases; a densimeter introduced into the cider shows its specific gravity to be from 10.15 to 10.20; the liquor has become clear, the grosser lees settling to the bottom, and the lighter rising to the surface, so that the cider is, as it were, between two layers of lees. This is the time to draw it off. The cider having been drawn off into a clean barrel, undergoes, after a certain time, a second fermentation, very much less energetic than the first. When this second fermentation becomes feeble, and carbonic acid is no longer disengaged, the barrel is completely closed until the time arrives for using the cider, when it is again drawn off by a spigot or faucet. Cider is preserved well enough in barrels when completely full, but when the barrel has been partly emptied, there is danger of its degenerating in quality. This is so well understood in France, that when a certain quantity of the cider has been drawn off, the remainder is protected by what is known as "Noel's Protector," much the same as a simple covering or thin layer of oil, which excludes the air, and prevents the entrance of noxious microbes which would soon transform the cider into vinegar. Bottling cider has become a large industry in France. Good cider in bottles ought to be clear and sparkling, and when properly prepared is a popular table drink, not only on account of its pleasant and refreshing taste, but for the more important reason that cider is now regarded in France as the most hygienic of all drinks, much more, indeed, than the best of wines. Condensed from the "*Journal of the Society of Arts*."

NOTICES OF BOOKS.

LESSONS WITH PLANTS, ETC. By L. H. Bailey (Macmillan & Co.)

THE sub-title of this little volume is entitled "Suggestions for seeing and interpreting some of the Common Forms of Vegetation." We may imagine the teacher with his blackboard and his Apple-twig, and each pupil provided with similar twigs. The appearances of the twig are pointed out, and the inferences that may be drawn from them explained. The pupil is thus first of all made to see, and then to reflect on what he has seen. Next day another twig is taken, less assistance is given by the teacher, but the pupil is as before encouraged to see for himself, and to compare what he now sees with what he has seen before; and so with the flowers and the fruits. This is an excellent way of teaching botany, or, indeed, any other natural science: the system is invaluable to the future botanist; it is of the highest service as a mental discipline to anyone, whatever his future destiny may be.

The illustrations chosen from buds of various natures, and at various stages of growth, would form an excellent preparation for young gardeners. Indeed, the whole book abounds in suggestive statements, the subject is treated with welcome freshness, and it is copiously illustrated with original illustrations. The book is provided with index and glossary.

THE CALIFORNIA VEGETABLES IN GARDEN AND FIELD, by E. J. Wicksen, A.M.; Pacific Rural Press, San Francisco. (London: Gay & Bird.)

"EXPERIENCED gardeners from other states and countries soon find that their accustomed procedure fails of its wonted results: that the old times and ways of doing things are unsuitable, and that new rules of practice must be learned." This sentence explains the purport of a book which is further

entitled, "a manual of practice with and without irrigation, for semi-tropical countries." The subject, we are told, is "appalling in its intricacy," conditions of soil and climate in California being varied to the last degree, whilst practice must vary with them. However different the conditions, the principles must be the same. It is impossible to teach "practice" in the college class-room; that must come from experience, but the principles that govern practice are best taught in the laboratory and class-room, and some hints as to their application in the trial ground and experimental station.

Market-gardening in California has had its vicissitudes; it did not at first accord with the adventurous spirit of the day. Small growers near the cities, we are told, did well, but there was not dash enough about market-gardening for Americans, who, consequently, allowed the business to pass into the hands of Chinese or other emigrants. Great enterprises in live-stock, Wheat, wool, and fruit afforded opportunities more to the American taste than vegetable-growing. The American settler had incomparably more energy and industrial ambition than his predecessors the Mexicans, but he shared with them a liking for doing his work in the saddle, or on the seat of a riding-plough, cultivator, or harvester. Hence, it has happened that the competition which the American grower has to encounter is depressing and discouraging; but yet, says the author, the situation is not at all hopeless. "The foreigners are not, as a rule, progressive. They are frugal and industrious to an extreme, and they undertake to please their customers with variety as well as low prices . . . but it is quite easy to surpass them in quality by constant effort for improved varieties which they are slow to introduce, and to cheapen production by the use of horse-labour and improved tools, while they plod along with hand methods and appliances." The successive chapters of this book are devoted to generalities concerning climate, soil, irrigation, manures, and then to a discussion of the appropriate methods of cultivation of vegetables in alphabetical order, from Asparagus to Turnips.

In some districts cultivation and supply are continuous throughout the year, as in the case of Beet, for instance, which can be sown at any time, and taken from the ground every day in the year, as can also Lettuce and Spinach, seasons being thus practically unknown. In the mountains, of course, the conditions are different, and the practice resembles that of temperate and cold climates generally. In the case of Aubergines, which are much grown in California, we are seriously told "that it is not unusual to find at California fairs specimens of 6 lb. weight, while fruit of 2 and 3 lb. constitute common stock with the vegetable peddlers!" It must be remembered that the author is not speaking of Pumpkins but of Aubergines. When he comes to Pumpkins, or Squashes, weights of 300 pounds! are mentioned. One farmer, whose truth and probity are vouched for by personal knowledge, had ten Squashes, the aggregate weight of which was 1 ton and 50 pounds. The largest of these weighed singly 225 pounds. From another, which weighed 210 pounds, the seeds were removed, "my boy (aged 16) then got into it, and I put the pieces together and completely closed him in. I then persuaded my 18-year-old daughter to get into it, and I closed her in, in the same manner. My daughter's weight was 110 pounds. I then put two 7-year-old boys in at once. I then put my three little girls in at once; they were aged respectively 6, 4, and 2 years, their united weights being 116 pounds. . . . The Squash was 3 feet 4 or 5 inches in length." The reader will please note, that we hold ourselves only responsible for the correctness of our copy!

Turnips and Kohl Rabi are not in favour, as they do not endure heat and drought, and are much subject to fungus. Happily the stock-feeder has many other more serviceable crops.

A chapter is devoted to canning and drying vegetables, valuable resources in times of glut. Seed-growing furnishes another chapter. The seeds principally grown are Onion, Lettuce, Carrot, Beet,

and flower-seeds, especially Sweet Peas. Among the remedies proposed for insects is one which might be tried with advantage; viz., kerosene-powder, made by stirring a tablespoonful of the oil with a quart of pulverised gypsum or air-slaked lime.

It will be seen that although the book before us is specially adapted for Californian use, yet that its perusal may be strongly recommended to our own market-gardeners, who will find in it many a hint, and much subject for reflection.

WEATHER LORE; a collection of Proverbs, Sayings, and Rules concerning the Weather. Compiled and arranged by Richard Inwards (Elliot Stock, 62, Paternoster Row).

THIS is a third, enlarged, and revised edition of a book which it must have been no small labour to compile. The "proverbs, curious rhymes, quaint sayings, archaic saws, outdoor rules, and weather wisdom generally," have been culled from many countries, and are here (all in English) arranged and tabulated in a form useful for reference. Granting as an acknowledged fact our inability to precisely foretell what the future weather and climate will be, which coming winters will be severe, which summers most abundant in sunshine, and so on, we can, to some extent, make use of prophecies based on practical observation which have been more or less fulfilled in the past. This sort of knowledge is based on general observation rather than on scientific details, but nevertheless has a value of its own. It is at least interesting to compare our predecessors' observations with our own, and if our conclusions prove different, they may lead to the detection of some error in calculation or deduction, and so, ultimately, to a more exact knowledge.

Even "fossil wisdom," as Mr. Inwards calls it, embodied in these old traditions, makes amusing reading; and so also do the quotations about birds, beasts, reptiles, and plants as weather-prophets.

In fact, there is something here to please everyone. The careful student may compare the bits of wisdom, and balance one with another, and the occasional reader will find amusement in turning over the pages and picking out a gem now and then. Reference to any required item is, as has been before said, made easy by the arrangement of the book, and a good index is a further help.

In conclusion, attention should be called to the frontispiece, "depicting the clouds, according to the arrangements and nomenclature agreed on at the recent International Cloud Conference. These beautiful representations of cloudland were taken direct from Nature by Colonel H. M. Saunders, of Cheltenham, and render the different aspects of the clouds with great accuracy and artistic faithfulness."

The little pictures are, indeed, as charming as they are lifelike, and we again commend the book to all, whether they be much or little interested in the topic with which it deals. If it will not predict exactly when to carry an umbrella, it may, at least, solace during a wet day spent of necessity indoors.

MARKET GARDENING.

TOMATOS AT MR. WM. LAWRENSON'S NURSERIES, EAGLESCLIFFE FARM, YARM.

WE sent an account of a visit to this establishment three years ago to the *Gardeners' Chronicle*, describing Mr. Lawrenson's selected varieties of Tomato. We had the pleasure to look over his place a few days ago (June 16), and are now more convinced than ever that in his No. 3 Mr. Lawrenson is the fortunate possessor of a superior strain of Tomato. The plants at Eaglescliffe bear evidence that they are under the care of experts, and it is quite a treat to see the plants in the different houses, on some of which the fruits are beginning to ripen, whilst on others the bunches are just beginning to form. The former are single stems, 7 feet long, grown in 9-inch pots and plunged; the stems are nearly $\frac{3}{4}$ inch in diameter, and are covered with bunches 8 to 9 inches apart. I noticed a number of bunches resting on the

ms of the pots, which proves that it is a free-setting variety. Another characteristic is the distinct double like, in the bunch of which we saw a lot bearing from four to seven fine fruits each. Mr. Lawrenson informed me that he saved a quantity of seed last year from one bunch which weighed 4 lbs. I saw a number of bunches which will probably exceed 3 lbs. The fruits on the lower trusses of No. 3 show a little "pap" in the centre, but this disappears as the plants grow taller, and the fruit becomes quite smooth, of a bright red colour. The writer, who has grown this variety now for some time, remarked the distinct improvement which has been made with this fine variety since he first saw it, which goes to prove what careful selection extending over several years is capable of effecting. Grown beside some of the supposed "crack varieties" last season, No. 3 was far superior to them; we wonder what name Mr. Lawrenson will ultimately bestow on this useful variety. I should be inclined to name it "Never fail!"

Great additions have of late been made to the glass-houses, and Mr. Lawrenson informed me that he will shortly erect a number of others. *Visitor.*

PASSION-FLOWER COMING ON A TENDRIL.

THE tendrils of Passion-flowers are considered to be abortive flower-stalks (see Masters in *Flora Brasiliensis* "Passifloraceæ"). That this view is correct is shown by the occasional presence of flowers on the tendrils, as shown in fig. 8.

EDINBURGH SCHOOL OF RURAL ECONOMY.

THE prospectus of the Edinburgh School of Rural Economy for the Session 1898-99 has now been issued. These classes have met with great success, and have been highly appreciated. In each of the last three years over 200 students attended the classes.

The courses of instruction arranged for the Session 1898-99 are similar to those of last year. Their main features are:—

1. A Two Years' Curriculum of Day Classes in Agriculture and allied Sciences.
2. A course of Day Lectures on Forestry in the University.
3. An extensive series of Evening Classes on Agriculture and allied Sciences, embracing Horticulture and Forestry; and
4. The usual Summer Vacation Classes for Schoolmasters, which have been well attended.
5. A Month's Course for Farmers and Farmers' Sons.

The month's course for farmers and farmers' sons and others who cannot spare time for a longer course is a new feature. This course will be held in the month of December, when there is a lull in farm-work, and the instruction provided is of an eminently practical character. It embraces lectures on Soils, Manures and their Uses, Food and Feeding; on the Elementary Chemistry of the Farm, Veterinary Hygiene, and Insect Pests, while practical instruction in joinery work is also to be given.

The day classes extend over two Sessions, each beginning in October and ending in March. It is expected that those entering for these classes will have previously completed a good general school training.

The work of the First Session, embracing Mensuration, Mechanics, Elementary Physics and Chemistry, Botany, Book-keeping, Drawing, and Handicraft, practically completes the preliminary education of the student, and gives him an adequate knowledge of the elements of the sciences that have a direct bearing on agriculture. At the same time his interest in the practical aspect of his work is maintained by such class exercises as those in measuring buildings and fields, in making drawings of these on scale, in woodwork, and in the application of physics in agriculture.

The subjects of study in the Second Session are Agriculture; Agricultural Chemistry, Botany,

Zoology, and Entomology; Veterinary Science and Forestry.

The complete course thus aims at fitting a young man to enter with intelligence into his work as a farmer, a gardener, or a forester. It should enable him to understand the greater part of the work that he will see in practice, and to study for himself any special subject that he may afterwards find to be of importance to him. A student who has satisfactorily completed the two years' course of study, and who has had the required experience of practical work on the farm or in the forest, should find himself sufficiently prepared for the examination for the Diploma of the Highland and Agricultural Society.

Numerous and varied evening classes are provided for those who are otherwise engaged during the day.

A specially moderate scale of fees has been arranged. This will be indicated by the fact that the inclusive fee for the First Year's entire Course in Agriculture is five guineas.

Copies of the Syllabus are to be had from the Secretary, 3, George IV. Bridge, Edinburgh.

FIG. 8.—TENDRIL OF PASSION-FLOWER BEARING A FLOWER.

FOREIGN CORRESPONDENCE.

THE WELWITSCHIA COUNTRY.

I FEEL sure that some remarks about *Welwitschia mirabilis* will interest many of your readers. Three weeks ago I arrived here, coming over Spitzkopjes from Swakopmund to Salem, a place situated on the left border of the Tsoachaub (Swakop), a hundred kilometres eastwards from Swakopmund. I was impressed by the wonderful and luxuriant vegetation of the broad and low borders of that river, the most beautiful tree being the Ana-tree (*Acacia albida*), now covered with ripe curled mealy pods, of which oxen and goats are very fond. Many trees that I measured are 5 to 7 metres in circumference 5 feet above the soil, and 20 metres in height. It is a pity that the wood is perfectly useless as timber, as it is soft, like Poplar-wood, and rots very soon in the soil. Of other trees there are growing, mixed with *Acacia albida*, *A. Giraffæ*, several fine specimens of a species of *Ficus*, with edible Peach-red fruits, and *Tamarix austro-africana*. In Salem there grows also a solitary *Acacia horrida*, which is so common in the whole

Namaland, and a few steps from my small house, an old mission-station, a Date-palm planted long ago by the old missionary, Mr. Böhm, residing now in Walfish-bay. *Euclea pseud-ebenum* (Ebony tree) grows only in the dry tributaries of the Tsoachaub.

The plants of the black alluvial deposits of the Tsoachaub are among many others, a beautiful yellow-flowered *Codon*, *Cardiospermum* (*Halicacabum*?), the perennial *Cucumis ecirrhosus* (a Water-Melon, with very small elegant foliage, and bitter, yellow fruits of the size of a small Melon); the common *Cucumis Citrullus* (Water-Melon), but excessively bitter, four other kinds of *Cucurbitaceæ*, three kinds of *Cleome*, a wonderful suffrutescent *Digitalis*, 1½ foot high, with flowers like those of *Digitalis purpurea*; three *Pedalinæ*, one of them 8 to 10 feet high, with long white flowers; two *Heliotropiums*, a frutescent, red-flowering *Gossypium*, a *Gomphocarpus*, a *Celosia*, four *Cyperus*, two *Achyranthes*, two splendid *Sida*, 8 to 12 feet high, a *Lythrum*, a *Lentibularia*, three *Tribulus*, and a host of other things, which I do not know at all. Of introduced weeds there are *Ricinus communis* (forming real trees), *Nicotiana glauca*, *Portulaca oleracea*, *Veronica Anagallis*, *Chenopodium botrys*, *Polygonum persicaria*, and *Arundo Donax*.

Living only sixty kilometres distance from the locus classicus of the *Welwitschia*, I decided one day to go down to that famous place in order to collect flowers, or if possible ripe seeds of that vegetable wonder. Haillgamchab, the name of the place in question, is situated on the left border of the Tsoachaub, which crosses the Namieb or desert from east to west. Going down from the yellow sandy and hilly plain to the police station, which is situated under the Ana-trees of the Tsoachaub, I very soon found the first female specimen of *Welwitschia*. For eventual reproduction I send you an inflorescence of this as well as a male one, of which I found an enormous specimen not far from the former. Among all the hundreds of plants that I found afterwards, I discovered not a single seedling which I could dig out in order to replant it at Salem. There are specimens with leaves 3 metres long and 2 feet broad, others which have divided themselves into two, three, or four heads. Not a single plant shows entire leaves, most of them are dry from the top as far as the middle, and all are lacerated longitudinally. Whether the fresh leaf is acuminate or obtuse, I cannot tell. Even in places where nobody has ever seen them the leaves are likewise lobed.

The old cones of last year, of which I collected a great number, contained only imperfect or empty seeds. In a few weeks the seeds will be ripe, and then I shall go down again to Haillgamchab to collect as many as possible of them for distribution among botanical institutes. *Welwitschia* seems to require more water than is generally believed, as its roots sink very deep into the crevices of the granitic rocks, as well as into loose deep granitic sand, where there is some moisture almost during the whole year. I think it will succeed in a Cape—or succulent-house—like those at Kew, or in such a situation as Comm. Hanbury's garden at La Mortola, or the gardens between Mentone and Nizza.

Before I saw the *Welwitschia* in its home I supposed that it lived in places that are perfectly uninhabitable by other plants. This opinion I must state is an error. I found in its company plants that are scattered almost over the whole country, as *Cleome*, *Acacia Giraffæ*, two *Zygophyllums*, two *Papilionaceæ*, several *Acanthaceæ*, *Aristida*, and others. As it very seldom rains in the Namieb (often not for several years), it is not astonishing that I could not find seedlings of *Welwitschia*. The seeds require, I suppose, at least one heavy rain for their germination; the dew can hardly be sufficient for this process. *K. Dinter.*

JUNIPERUS SINENSIS.

THIS is a form of a species of *Juniperus* in Messrs. Sanders' establishment, like *japonica*, in which the primordial leaves alone are present; though the shrub has attained a considerable size, no trace of the true foliage has as yet appeared. The leaves are in four regular ranks

so rapidly, that the deficiency in the must to which it has been added is soon overcome, and a fresh and complete fermentation takes place. In like manner, a good cider may be destroyed by the addition of a bad ferment, often unwittingly added, by not taking care to thoroughly clean the instruments and vessels employed in the fabrication of the cider. In France, an artificial leaven, made from Apples of the best growth, is an article of commerce, and is much used to correct deficiencies in must of a poor quality. A quart of this leaven, costing about 4s., will serve to improve from 130 to 140 gallons of an indifferent must. This leaven, or artificial ferment, has been used with very satisfactory results for several years, and is apparently growing in favour with large cider-makers. After ten or fifteen days the fermentation ceases; a densimeter introduced into the cider shows its specific gravity to be from 10.15 to 10.20; the liquor has become clear, the grosser lees settling to the bottom, and the lighter rising to the surface, so that the cider is, as it were, between two layers of lees. This is the time to draw it off. The cider having been drawn off into a clean barrel, undergoes, after a certain time, a second fermentation, very much less energetic than the first. When this second fermentation becomes feeble, and carbonic acid is no longer disengaged, the barrel is completely closed until the time arrives for using the cider, when it is again drawn off by a spigot or faucet. Cider is preserved well enough in barrels when completely full, but when the barrel has been partly emptied, there is danger of its degenerating in quality. This is so well understood in France, that when a certain quantity of the cider has been drawn off, the remainder is protected by what is known as "Noel's Protector," much the same as a simple covering or thin layer of oil, which excludes the air, and prevents the entrance of noxious microbes which would soon transform the cider into vinegar. Bottling cider has become a large industry in France. Good cider in bottles ought to be clear and sparkling, and when properly prepared is a popular table drink, not only on account of its pleasant and refreshing taste, but for the more important reason that cider is now regarded in France as the most hygienic of all drinks, much more, indeed, than the best of wines. *Condensed from the "Journal of the Society of Arts."*

NOTICES OF BOOKS.

LESSONS WITH PLANTS, ETC. By L. H. Bailey (Macmillan & Co.)

THE sub-title of this little volume is entitled "Suggestions for seeing and interpreting some of the Common Forms of Vegetation." We may imagine the teacher with his blackboard and his Apple-twig, and each pupil provided with similar twigs. The appearances of the twig are pointed out, and the inferences that may be drawn from them explained. The pupil is thus first of all made to see, and then to reflect on what he has seen. Next day another twig is taken, less assistance is given by the teacher, but the pupil is as before encouraged to see for himself, and to compare what he now sees with what he has seen before; and so with the flowers and the fruits. This is an excellent way of teaching botany, or, indeed, any other natural science: the system is invaluable to the future botanist; it is of the highest service as a mental discipline to anyone, whatever his future destiny may be.

The illustrations chosen from buds of various natures, and at various stages of growth, would form an excellent preparation for young gardeners. Indeed, the whole book abounds in suggestive statements, the subject is treated with welcome freshness, and it is copiously illustrated with original illustrations. The book is provided with index and glossary.

THE CALIFORNIA VEGETABLES IN GARDEN AND FIELD, by E. J. Wicksen, A.M.; Pacific Rural Press, San Francisco. (London: Gay & Bird.)

"EXPERIENCED gardeners from other states and countries soon find that their accustomed procedure fails of its wonted results: that the old times and ways of doing things are unsuitable, and that new rules of practice must be learned." This sentence explains the purport of a book which is further

entitled, "a manual of practice with and without irrigation, for semi-tropical countries." The subject, we are told, is "appalling in its intricacy," conditions of soil and climate in California being varied to the last degree, whilst practice must vary with them. However different the conditions, the principles must be the same. It is impossible to teach "practice" in the college class-room; that must come from experience, but the principles that govern practice are best taught in the laboratory and class-room, and some hints as to their application in the trial ground and experimental station.

Market-gardening in California has had its vicissitudes; it did not at first accord with the adventurous spirit of the day. Small growers near the cities, we are told, did well, but there was not dash enough about market-gardening for Americans, who, consequently, allowed the business to pass into the hands of Chinese or other emigrants. Great enterprises in live-stock, Wheat, wool, and fruit afforded opportunities more to the American taste than vegetable-growing. The American settler had incomparably more energy and industrial ambition than his predecessors the Mexicans, but he shared with them a liking for doing his work in the saddle, or on the seat of a riding-plough, cultivator, or harvester. Hence, it has happened that the competition which the American grower has to encounter is depressing and discouraging; but yet, says the author, the situation is not at all hopeless. "The foreigners are not, as a rule, progressive. They are frugal and industrious to an extreme, and they undertake to please their customers with variety as well as low prices . . . but it is quite easy to surpass them in quality by constant effort for improved varieties which they are slow to introduce, and to cheapen production by the use of horse-labour and improved tools, while they plod along with hand methods and appliances." The successive chapters of this book are devoted to generalities concerning climate, soil, irrigation, manures, and then to a discussion of the appropriate methods of cultivation of vegetables in alphabetical order, from Asparagus to Turnips.

In some districts cultivation and supply are continuous throughout the year, as in the case of Beet, for instance, which can be sown at any time, and taken from the ground every day in the year, as can also Lettuce and Spinach, seasons being thus practically unknown. In the mountains, of course, the conditions are different, and the practice resembles that of temperate and cold climates generally. In the case of Aubergines, which are much grown in California, we are seriously told "that it is not unusual to find at California fairs specimens of 6 lb. weight, while fruit of 2 and 3 lb. constitute common stock with the vegetable peddlers!" It must be remembered that the author is not speaking of Pumpkins but of Aubergines. When he comes to Pumpkins, or Squashes, weights of 300 pounds! are mentioned. One farmer, whose truth and probity are vouched for by personal knowledge, had ten Squashes, the aggregate weight of which was 1 ton and 50 pounds. The largest of these weighed singly 225 pounds. From another, which weighed 210 pounds, the seeds were removed, "my boy (aged 16) then got into it, and I put the pieces together and completely closed him in. I then persuaded my 18-year-old daughter to get into it, and I closed her in, in the same manner. My daughter's weight was 110 pounds. I then put two 7-year-old boys in at once. I then put my three little girls in at once; they were aged respectively 6, 4, and 2 years, their united weights being 116 pounds. . . . The Squash was 3 feet 4 or 5 inches in length." The reader will please note, that we hold ourselves only responsible for the correctness of our copy!

Turnips and Kohl Rabi are not in favour, as they do not endure heat and drought, and are much subject to fungus. Happily the stock-feeder has many other more serviceable crops.

A chapter is devoted to canning and drying vegetables, valuable resources in times of glut. Seed-growing furnishes another chapter. The seeds principally grown are Onion, Lettuce, Carrot, Beet,

and flower-seeds, especially Sweet Peas. Among the remedies proposed for insects is one which might be tried with advantage; viz., kerosene-powder, made by stirring a tablespoonful of the oil with a quart of pulverised gypsum or air-slaked lime.

It will be seen that although the book before us is specially adapted for Californian use, yet that it perusal may be strongly recommended to our own market-gardeners, who will find in it many a hint and much subject for reflection.

WEATHER LORE; a collection of Proverbs, Sayings, and Rules concerning the Weather. Compiled and arranged by Richard Inwards (Elliot Stock 62, Paternoster Row).

THIS is a third, enlarged, and revised edition of a book which it must have been no small labour to compile. The "proverbs, curious rhymes, quaint sayings, archaic saws, outdoor rules, and weather wisdom generally," have been culled from many countries, and are here (all in English) arranged and tabulated in a form useful for reference. Granting as an acknowledged fact our inability to precisely foretell what the future weather and climate will be, which coming winters will be severe, which summer most abundant in sunshine, and so on, we can, to some extent, make use of prophecies based on practical observation which have been more or less fulfilled in the past. This sort of knowledge is based on general observation rather than on scientific details, but nevertheless has a value of its own. It is at least interesting to compare our predecessors' observations with our own, and if our conclusions prove different, they may lead to the detection of some error in calculation or deduction, and so ultimately, to a more exact knowledge.

Even "fossil wisdom," as Mr. Inwards calls it embodied in these old traditions, makes amusing reading; and so also do the quotations about birds, beasts, reptiles, and plants as weather-prophets.

In fact, there is something here to please everyone. The careful student may compare the bits of wisdom and balance one with another, and the occasional reader will find amusement in turning over the pages and picking out a gem now and then. Reference to any required item is, as has been before said, made easy by the arrangement of the book, and a good index is a further help.

In conclusion, attention should be called to the frontispiece, "depicting the clouds, according to the arrangements and nomenclature agreed on at the recent International Cloud Conference. These beautiful representations of cloudland were taken direct from Nature by Colonel H. M. Saunders, of Cheltenham, and render the different aspects of the cloud with great accuracy and artistic faithfulness."

The little pictures are, indeed, as charming as they are lifelike, and we again commend the book to all whether they be much or little interested in the topic with which it deals. If it will not predict exactly when to carry an umbrella, it may, at least, solace during a wet day spent of necessity indoors.

MARKET GARDENING.

TOMATOS AT MR. WM. LAWRENSON'S NURSERY SERIES, EAGLESCLIFFE FARM, YARM.

WE sent an account of a visit to this establishment three years ago to the *Gardeners' Chronicle*, describing Mr. Lawrenson's selected varieties of Tomato. We had the pleasure to look over his place a few days ago (June 16), and are now more convinced than ever that in his No. 3 Mr. Lawrenson is the fortunate possessor of a superior strain of Tomato. The plants at Eaglescliffe bear evidence that they are under the care of experts, and it is quite a treat to see the plants in the different houses, on some of which the fruits are beginning to ripen, whilst on other the bunches are just beginning to form. The former are single stems, 7 feet long, grown in 9-inch pots and plunged; the stems are nearly $\frac{3}{4}$ inch in diameter, and are covered with bunches 8 to 9 inches apart. I noticed a number of bunches resting on the

of the pots, which proves that it is a free-setting variety. Another characteristic is the distinct double ke, in the bunch of which we saw a lot bearing from four to seven fine fruits each. Mr. Lawrenson informed me that he saved a quantity of seed last year from one bunch which weighed 4 lbs. I saw a number of bunches which will probably exceed 3 lbs. The fruits on the lower trusses of No. 3 show a little "cap" in the centre, but this disappears as the plants grow taller, and the fruit becomes quite smooth, of a bright red colour. The writer, who has grown this variety now for some time, remarked the distinct improvement which has been made with this fine variety since he first saw it, which goes to prove what careful selection extending over several years is capable of effecting. Grown beside some of the supposed "crack varieties" last season, No. 3 was far superior to them; we wonder what name Mr. Lawrenson will ultimately bestow on this useful variety. It should be inclined to name it "Never fail!" Great additions have of late been made to the glass-houses, and Mr. Lawrenson informed me that he will shortly erect a number of others. *Visitor.*

PASSION-FLOWER COMING ON A TENDRIL.

THE tendrils of Passion-flowers are considered to be abortive flower-stalks (see Masters in *Flora Brasiliensis* "Passifloraceæ"). That this view is correct is shown by the occasional presence of flowers on the tendrils, as shown in fig. 8.

EDINBURGH SCHOOL OF RURAL ECONOMY.

THE prospectus of the Edinburgh School of Rural Economy for the Session 1898-99 has now been issued. These classes have met with great success, and have been highly appreciated. In each of the last three years over 200 students attended the classes.

The courses of instruction arranged for the Session 1898-99 are similar to those of last year. Their main features are:—

1. A Two Years' Curriculum of Day Classes in Agriculture and allied Sciences.
2. A course of Day Lectures on Forestry in the University.
3. An extensive series of Evening Classes on Agriculture and allied Sciences, embracing Horticulture and Forestry; and
4. The usual Summer Vacation Classes for Schoolmasters, which have been well attended.
5. A Month's Course for Farmers and Farmers' Sons.

The month's course for farmers and farmers' sons and others who cannot spare time for a longer course is a new feature. This course will be held in the month of December, when there is a lull in farm-work, and the instruction provided is of an eminently practical character. It embraces lectures on Soils, Manures and their Uses, Food and Feeding; on the Elementary Chemistry of the Farm, Veterinary Hygiene, and Insect Pests, while practical instruction in joinery work is also to be given.

The day classes extend over two Sessions, each beginning in October and ending in March. It is expected that those entering for these classes will have previously completed a good general school training.

The work of the First Session, embracing Mensuration, Mechanics, Elementary Physics and Chemistry, Botany, Book-keeping, Drawing, and Handicraft, practically completes the preliminary education of the student, and gives him an adequate knowledge of the elements of the sciences that have a direct bearing on agriculture. At the same time his interest in the practical aspect of his work is maintained by such class exercises as those in measuring buildings and fields, in making drawings of these to scale, in woodwork, and in the application of physics in agriculture.

The subjects of study in the Second Session are Agriculture; Agricultural Chemistry, Botany,

Zoology, and Entomology; Veterinary Science and Forestry.

The complete course thus aims at fitting a young man to enter with intelligence into his work as a farmer, a gardener, or a forester. It should enable him to understand the greater part of the work that he will see in practice, and to study for himself any special subject that he may afterwards find to be of importance to him. A student who has satisfactorily completed the two years' course of study, and who has had the required experience of practical work on the farm or in the forest, should find himself sufficiently prepared for the examination for the Diploma of the Highland and Agricultural Society.

Numerous and varied evening classes are provided for those who are otherwise engaged during the day.

A specially moderate scale of fees has been arranged. This will be indicated by the fact that the inclusive fee for the First Year's entire Course in Agriculture is five guineas.

Copies of the Syllabus are to be had from the Secretary, 3, George IV. Bridge, Edinburgh.

FIG. 8.—TENDRIL OF PASSION-FLOWER BEARING A FLOWER.

FOREIGN CORRESPONDENCE.

THE WELWITSCHIA COUNTRY.

I FEEL sure that some remarks about *Welwitschia mirabilis* will interest many of your readers. Three weeks ago I arrived here, coming over Spitzkopjes from Swakopmund to Salem, a place situated on the left border of the Tsoachaub (Swakop), a hundred kilometres eastwards from Swakopmund. I was impressed by the wonderful and luxuriant vegetation of the broad and low borders of that river, the most beautiful tree being the Ana-tree (*Acacia albida*), now covered with ripe curled mealy pods, of which oxen and goats are very fond. Many trees that I measured are 5 to 7 metres in circumference 5 feet above the soil, and 20 metres in height. It is a pity that the wood is perfectly useless as timber, as it is soft, like Poplar-wood, and rots very soon in the soil. Of other trees there are growing, mixed with *Acacia albida*, *A. Giraffæ*, several fine specimens of a species of *Ficus*, with edible Peach-red fruits, and *Tamarix austro-africana*. In Salem there grows also a solitary *Acacia horrida*, which is so common in the whole

Namaland, and a few steps from my small house, an old mission-station, a Date-palm planted long ago by the old missionary, Mr. Böhm, residing now in Walfish-bay. *Euclea pseud-ebenum* (Ebony tree) grows only in the dry tributaries of the Tsoachaub.

The plants of the black alluvial deposits of the Tsoachaub are among many others, a beautiful yellow-flowered *Codon*, *Cardiospermum* (*Halicacabum*?), the perennial *Cucumis ecirrhosus* (a Water-Melon, with very small elegant foliage, and bitter, yellow fruits of the size of a small Melon); the common *Cucumis Citrullus* (Water-Melon), but excessively bitter, four other kinds of *Cucurbitaceæ*, three kinds of *Cleome*, a wonderful suffrutescent *Digitalis*, 1½ foot high, with flowers like those of *Digitalis purpurea*; three *Pedaliaceæ*, one of them 8 to 10 feet high, with long white flowers; two *Heliotropiums*, a frutescent, red-flowering *Gossypium*, a *Gomphocarpus*, a *Celosia*, four *Cyperus*, two *Achyranthes*, two splendid *Sida*, 8 to 12 feet high, a *Lythrum*, a *Lentibularia*, three *Tribulus*, and a host of other things, which I do not know at all. Of introduced weeds there are *Ricinus communis* (forming real trees), *Nicotiana glauca*, *Portulaca oleracea*, *Veronica Anagallis*, *Chenopodium botrys*, *Polygonum persicaria*, and *Arundo Donax*.

Living only sixty kilometres distance from the locus classicus of the *Welwitschia*, I decided one day to go down to that famous place in order to collect flowers, or if possible ripe seeds of that vegetable wonder. Haillgamchab, the name of the place in question, is situated on the left border of the Tsoachaub, which crosses the Namieb or desert from east to west. Going down from the yellow sandy and hilly plain to the police station, which is situated under the Ana-trees of the Tsoachaub, I very soon found the first female specimen of *Welwitschia*. For eventual reproduction I send you an inflorescence of this as well as a male one, of which I found an enormous specimen not far from the former. Among all the hundreds of plants that I found afterwards, I discovered not a single seedling which I could dig out in order to replant it at Salem. There are specimens with leaves 3 metres long and 2 feet broad, others which have divided themselves into two, three, or four heads. Not a single plant shows entire leaves, most of them are dry from the top as far as the middle, and all are lacerated longitudinally. Whether the fresh leaf is acuminate or obtuse, I cannot tell. Even in places where nobody has ever seen them the leaves are likewise lobed.

The old cones of last year, of which I collected a great number, contained only imperfect or empty seeds. In a few weeks the seeds will be ripe, and then I shall go down again to Haillgamchab to collect as many as possible of them for distribution among botanical institutes. *Welwitschia* seems to require more water than is generally believed, as its roots sink very deep into the crevices of the granitic rocks, as well as into loose deep granitic sand, where there is some moisture almost during the whole year. I think it will succeed in a Cape—or succulent-house—like those at Kew, or in such a situation as Comm. Hanbury's garden at La Mortola, or the gardens between Mentone and Nizza.

Before I saw the *Welwitschia* in its home I supposed that it lived in places that are perfectly uninhabitable by other plants. This opinion I must state is an error. I found in its company plants that are scattered almost over the whole country, as *Cleome*, *Acacia Giraffæ*, two *Zygophyllums*, two *Papilionaceæ*, several *Acanthaceæ*, *Aristida*, and others. As it very seldom rains in the Namieb (often not for several years), it is not astonishing that I could not find seedlings of *Welwitschia*. The seeds require, I suppose, at least one heavy rain for their germination; the dew can hardly be sufficient for this process. *K. Dinter.*

JUNIPERUS SINENSIS.

This is a form of a species of *Juniperus* in Messrs. Saunders' establishment, like *japovica*, in which the primordial leaves alone are present; though the shrub has attained a considerable size, no trace of the true foliage has as yet appeared. The leaves are in four regular ranks

each leaf linear oblong, somewhat acute, 5—6 mill. long, of a beautiful glaucous blue on the upper surface.

In its present state it is highly ornamental, and has a strong juniperine odour.

NOTES FROM THE NETHERLANDS.

At the Botanical-Zoological Garden at The Hague, I noted a *Kleinia repens* (*Senecio repens*) from the Cape, with pauciflorous capitules in corymbs, and which florists should cultivate and use more generally; the free-flowering *Fuchsia* Mme. Rundler covered the side of a greenhouse with bloom; *Tacsonia Van Volxemi*, a hundred choice varieties of *Caladium*, *Cymbidium Lowi*, with thirty floral racemes from 3 to nearly 5 feet long; and other choice plants. I also admired a fine collection of *Vanda*, including choice and well-cultivated varieties, probably unique in any public garden.

In the Leyden Botanic Garden, *Caladiums* are grown thus: they are at first kept in full sunshine, then with the plants in water in full sun, and in the Victoria-house; the results, M. Ern. Th. Witte reports, are very satisfactory. *Lilium giganteum* succeeds well here in the shade; *Crinum Powellii*, intermedium, and album are hardy species, needing only to be covered in winter with a layer of grassy turf 1½ foot thick, which protects them from frost and damp, so that the plants grow vigorously and bloom freely; *Hesperis violacea* is an admirable plant, because of its long spikes of clear violet flowers, veined with reddish-violet; *Viburnum tomentosum plicatum* at the time of flowering becomes one large cluster of pure white; *Iris virginica* is an old but good plant, the flowers of which open well in water.

At Leyden, *Amaryllis* are a specialty. Bulbs in pots had been, on June 6, a fortnight under glass; when the shoots are 4 inches high, the glass will be removed, cultivation continued in the open-air, and at the end of July the plants will bloom.

At the Utrecht Botanic Garden I observed *Dendrobium macrophyllum Veitchianum*, a good Pansy, *Vanda tricolor* Thomas Glynn, lilac, and sweetly scented; *Calceolaria violacea*, a fruiting species from Chili, with charming and abundant little flowers; *Passiflora cœrulea*, *Impératrice Eugénie*, and *Aristolochia elegans* with thousands of flowers.

MM. Glym Davos et Cie., in addition to some fine Orchids, showed me *Pteris scaberula*, *Erythræa edulis*, a rare Palm; and a fine variegated Palm, *Chamærops excelsa* var., somewhat suggestive of *Tillandsia tessellata*.

At Maertensdyk-lez-Utrecht are the houses of Baron von Boetzelaar, a well-known Orchid-grower. Here were *Odontoglossum crispum*, *O. luteo-purpureum*, with a branching spike with sixty good flowers; *Cattleya Mendeli*, some good *Vandas*, *Cypripediums*, and fine specimens of *Oncidium sphacellatum*.

On June 8 there was held, at Amsterdam, a meeting of a plant and floral committee of the Horticultural and Botanical Society of the Netherlands. Mr. E. H. Krelage staged *Acalypha Sanderiana*, *Richardia africana* candidissima, *Iris nigricans*, *Tulipa Sprengeri*, *Calochortus Purdyi*, *mameanus roseus* and majus, *Brodiaea Howelli* lilacina, *Kniphofia Tucki*, and other plants. The same firm also showed a fine group, including *Iris sibirica*, *equalens*, *orientalis*, *plicata*, and *Dodecatheon*; *Helicodicera cristata*, *Pyrethrum Trollius Gibsoni*, *Sprekelia formosissima* and glauca, *Papaver*, *Oxalis*, and many other plants, a Gold Medal being awarded for the lot.

M. Schrober, of Utrecht, showed forced perpetual Strawberries of delicate scent, but somewhat watery flavour. Baron von Boetzelaar sent a fine *Odontoglossum crispum*, the divisions much spotted with brownish-red, of good form and large size; also another plant with pure white flowers, and a third, of the *Triana* group, also fine.

M. J. H. Tromp Meenters, of Stremoyk, in a group of Orchids showed a well-bloomed *Cattleya Skinneri*, with three clusters of large dark flowers; *Cymbidium*

Lowi with a dozen floral racemes; a strong plant of *Anguloa Clowesii*, and a fine *Cattleya Mendeli*.

M. S. Blecker, Director of the School of Horticulture, and G. A. van Swieten, of Frederiksoord, showed *Begonias* Tappich Königin and Louise de Vries, the former dwarf, free-flowering, easily budded, and a substitute for *Alternanthera paroxchoides*; the latter plant is from a semi-double Tuberous *Begonia* crossed with *B. Weltonensis*; this blooms from April to November, grows 2½ feet high, is easily budded, and should prove very useful.

MM. J. H. Kershen & Cie., of Heemstede, showed *Anemone coronaria*, fl.-pl., White Lady; M. J. C. de Langi, *Lilium rubellum*; M. Willink van Collen, *Lupinus nutkænsis*; MM. Peter van Velsen & Fils, of Overveen, some fine seedlings of *Anemone* St. Brigid; and M. B. Ruys, *Heuchera sanguinea alba*, which I thought an improvement on the type. *Ch. De B.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERRARD, Eastwell Park, Ashford.

Calendula officinalis fl.-pl. Meteor and Orange King, &c. *pluvialis*.—These are among the showiest and most effective of summer flowering annuals, useful alike for filling beds, planting in borders, or wherever masses of bright colour are desired. The height of the plants varies from 9 inches to 1 foot. The colours of the flowers range from a rich orange, and a deep lemon, and that of the last-named is white; beds of these varieties, planted alternately, have a striking effect. The plants grow with rapidity, and flowers freely, and the greater the better the soil.

Polyanthus and *Frimroses*.—If seeds of these plants were not sown in the spring, it is still a good time to sow either out-of-doors in a shaded spot, and cover the seed with some fine soil, or, what is preferable, in pots or boxes, placing these upon a bed of coal-ashes in a cold frame facing north. By the first mode of sowing, the seed is more likely to be unmolested, and in the second the young plants are more likely to be better cared for. The pans and boxes should be well drained, and the crocks covered with moss or rough leaf-mould, and the soil should consist of three-fourths leaf-mould and one-fourth loam, and a small quantity of sharp sand well mixed with it. If the soil is very dry, afford water, and wait an hour or two before sowing the seeds. Cover the seed very slightly with fine soil, and be sure that slugs do not molest them. When large enough to handle, let them be pricked out upon a partially shaded bed, and with the exception of an occasional application of water in dry weather, and keeping the ground free from weeds, they will need but little more attention until the autumn, when they may be planted in the places in which they are intended to flower.

Sweet Pea Pink Cupid.—This so far has proved, here, to be very superior to the white variety of that name; the flowers are of two shades of pink; and the height of the plants varies from 3 to 6 inches, with a breadth of about 1 foot, and the flowers are very numerous.

The Flower-beds.—The flowers are feeling the beneficial effects of the warmer weather, and rapidly covering the soil, and whilst their size permits of it being performed without damaging them, the soil should be stirred with the small single-handled hoe or handfork. *Calceolarias* should be supported by neat Birch twigs stuck in among the plants; and *Pelargoniums*, *Petunias*, &c., secured with pegs. If the ground is dry, afford copious applications of water either in the early morning or late in the day. *Violas* should be especially attended to in this respect, and the seed-vessels removed from the plants. The more tender sub-tropicals should now be in their places, taking care to make them secure against the wind if they are tall.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Cypripediums.—Those plants of *Cypripedium bellatulum*, *C. concolor*, *C. Godefroyæ*, and *C. niveum* which have just gone out of the flower-stage may be repotted, not disturbing them unnecessarily at the

root in the least degree, as the work needs the utmost care, the roots being very brittle. Healthy plants, if in pots of a suitable size, should have the whole of the old compost removed by picking it out of the drainage rearranged, and fresh rooting material afforded. Thriving specimens that require more space should have the old pot broken with a hammer and the decayed compost picked out without disturbing the roots, and if the drainage be permeated with roots, leave it untouched, and place the whole mass in a larger pot, filling up to about one-half depth with crocks, limestone, or broken bricks, and fill up firmly with the following compost:—G. fibrous loam, freely intermixed with small nodules of tufa-rock, and a small quantity of sphagnum-moss. Be sure to keep the rootstock about on a level with the rim of the pot, and the potting material about ½ in. below, which will render the affording of water a easy matter. Instead of affording water in the usual manner, it is much safer to dip *Cypripediums* in a pail of water, letting it just cover the surface of the compost. With this method there is little danger of water lodging in the centre of the plants or in the axils of the leaves. Throughout the growing season these plants require a good soaking each time they become dry, and all of them prefer the hot, moist condition usual in the East Indian-house, and a light position where they may be only thinly shaded at midday. Thrips damage the young foliage, and should be frequently sought after; but where the X.L.A. vaporiser is used periodically there will be little need to do this.

Cattleyas.—The weather this season has suited the requirements of *Cattleya gigas* and its free-flowering variety, *C. g. Sanderiana*, and any plant now showing flower should be placed in a shady part of the house, and kept more than ordinarily moist, in order that the growths may finish up well. Immediately the spikes are removed, only just enough water should be afforded as will save the roots from perishing. About a week or ten days afterwards the newly-made growths send out from their bases a great many roots—in fact, this *Cattleya* produces more roots after the flowering period than at any other season. This appearance of roots indicates the time for repotting, which if performed later may bring about a good deal of injury to the roots. In repotting supply ample drainage, elevate the plant somewhat above the rim of the pot, keeping it firm in its position by means of a few neat sticks, and pot with moderate firmness, using a compost that consists of two-thirds best fibry peat, and one-third of sphagnum-moss, broken crocks, and charcoal. After repotting, stand the plants at the cooler part of the *Cattleya* or intermediate-house, where there is sufficient light and air to consolidate the newly-made growth. Water must not be afforded very copiously, or the plants will make growth instead of resting; still, the compost must not become so dry as to cause shrivelling of the bulbs—a condition that causes no harm when the plants have become firmly rooted in the new compost. *Cattleya Dowiana* and its variety, if strong, will at this season be showing the flower-sheath, needing much care in keeping water from lodging around the bases of these sheaths, causing the decay of the flower-buds. This species does best when it is grown at the lightest and best ventilated part of the house. After the flowers have faded the same kind of treatment should be afforded as that advised for *C. gigas*. It is immaterial whether the plant be grown in a pan or a basket, but it is important that the potting material should be of a very porous nature. *C. Eldorado* and its varieties are mid-way through the growing season, and need warm, shady place, and in the case of well-rooted plants to be copiously afforded water till growth for the season is complete. *C. Eldorado* is the most worth growing, for the reason that the flowers appear at a time when but few Orchids are in bloom. Among other *Cattleyas* that require re-potting at this season are *C. Mendeli*, *C. Mossiae*, *C. Schroderæ*, *C. Warneri*, *Lælia purpurata*, *L. tenebrosa*, and the various *Cattleya* and *Lælio-Cattleya* hybrids that are beginning to grow anew. Plants of *Lælia anceps* and its numerous varieties are now growing fast and rooting freely. Now is the time to afford them plenty of root-moisture, drawing up the blinds early in the afternoon, damping well between the pots, stages, &c., and affording the plants a good overhead syringing.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Pineapples.—The plants of all ages should now be growing freely, filling the soil if they are in a healthy

ate with new roots, and rendering a liberal treatment very necessary. The bottom-heat should be kept up to 90° for fruiters, and 85° for successions, and 80° for those that are younger. With regard to the fruiting-plants, root moisture according to the particular needs of each plant, must be afforded to all, excepting those that indicate the ripening stage, which should not be afforded any. Occasionally weak manure may be afforded to the fruiters whilst the fruit is green, but not a large amount of aerial moisture, or the crowns will develop to an undesirable size. If a fruiting-house exists it is an easy matter to maintain the proper conditions, but if successions and fruiters are grown together their management becomes difficult, and the result is not as a rule very satisfactory. It is, of course, essential to keep those with fruits all together, and apart from the rest, and at the warmest part; and if more fruits are likely to be ripe at one time than there is demand for, the earliest ripe may be retarded by being placed in a cool, airy vinery when colouring begins. The temperature of the fruiting-house at dusk may be 75° at 6 A.M.; on dull, sunless days, 75°; and on sunny days it may vary from that figure to 90° when the house is closed. Avoid draughts of cold air, or air from the north-side of the house, reaching the plants. Usually tanners'-bark is employed as plunging material in a Pine-bed, either of itself to afford the necessary amount of bottom-heat, or to supplement the heating-apparatus; and in any case this body of material, if in a condition to afford heat, that is not decayed, will stand in need in the warmer months of an occasional application of very warm water, as without moisture tan alone ferments, and heats but slowly. Moreover, when in a dry state, the moisture is extracted from the soil in the pots, and from the bed of soil if they are grown without pots, to the detriment of the plants. To depend on the daily syringing of the bed is not enough. It frequently happens that a number of growths—"gills," in gardeners' parlance—form round the stalk at the base of the fruit, and more rarely round that of the crown; such should be twisted off as soon as observed, and also all suckers, excepting those needed to keep up the stock of plants, the strongest and best of which should be selected. In the case of scarce varieties, the crowns may be made use of, but the gardener must obtain possession of these as soon as the remains of the dessert are removed from the inner-table. It is a good practice to be always putting in a few suckers to root, and it is perhaps the only way in which a glut of fruit at one season, and scarcity at others, can be obviated.

Successions.—These plants should be kept slightly warm at top and bottom than the fruiters, and not lack for root-moisture; still, not affording one of them water until the state of the soil is ascertained. The chief points for the gardener to know are the state of the plants as regards their roots, and the condition of the soil in regard to moisture. Excessive over-potting is a thing to be avoided, it being the cause of unsuspected loss of roots; and a pot-bound condition, on the other hand, even if plant-food be supplied with guano-water and other liquid manures, is open to the risk of forcing the production of fruit at a time when the plant is too young to produce fine fruits, or of its coming when it is not required, and thus causing a scarcity at the right season. Successions must be kept in healthy growth at this the best season for making it, and to this end a moist, genial condition must be maintained in the house, in the plunging-bed, and in the soil in which the plants are grown, not, however, affording manure-water, the soil itself, if properly chosen, affording all the nutriment the plants need. On fine days, damp down at 8 A.M., afford a small quantity of air at 8.30 or 9 A.M., and again at 11 or at noon, damping the floors once or twice as may be necessary between whiles; the more sun the more moisture; and at 1 P.M. begin to reduce the ventilation, shutting up at 3 P.M., dewing the plants with tepid water, moistening the surface of the bed and the stems of the plants, and damping the floors and walls. On very sultry nights a small amount of ventilation may be given.

The Scalding of Grapes.—At this season the "scalding" of Grapes is commoner than at any other, and the dull weather that has this year prevailed during June renders fruit and foliage very liable to injury of this kind. Lady Downe's Seedling is one of the varieties very subject to scalding, and Madresfield Court is only a little less so, although no variety is immune. The injury is done at the latter part of the stoning period. In order to guard against scalding, let the heating apparatus be brought into use at the same time, maintaining the necessary

degree of warmth, and then ventilate freely. The vinery should indicate 70° at dusk, falling to 65° in the morning; and 70° to 75° should be the maximum on dull days, and on sunny days to 80° to 85°, shutting off the heat from the pipes if sunheat is sufficient. During the night some slight amount of ventilation may be afforded at the top of the vinery if rain can be excluded. The front ventilators may be opened by day when the day is very warm. Fungus diseases of the Vine are encouraged by a stagnant atmosphere in the vinery, which healthier conditions tend to check or prevent.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Onions.—The beds should be kept as clear of weeds as possible, and all plants damaged by the Onion-fly or mildew removed and burned. Let the bed be afforded a slight dressing of soot or guano, or of Thomson's plant-manure, mixing it with the surface-soil with the Dutch-hoe. This will tend to rapid growth, which is at all times necessary if the crop is at all grub infested. The Onion-plants raised under glass and transported in April are looking well this season. It is very necessary that the bed should be hoed often, and afforded the above-mentioned top dressing, although very little help with artificial manures will be needed if the land was well prepared in the autumn. The Onion-fly soon makes its presence known by the young plants toppling over instead of being erect, the result of the ingress of the grub just at the ground level.

Mushrooms.—Preparations may soon be made for making beds for furnishing the autumn supply. At this season the bed may be made up in a cool shed under trees. The quantity of short stable litter and horse-droppings should not be less than three or four one-horse cart-loads at a time, and should be allowed to ferment moderately, turning it occasionally, and throwing it into narrow ridges in order to keep down the fermentation and sweeten. When the rankness has been dissipated it is ready for making into beds. When this stage is reached it ought to be of a dark colour, soft, and damp enough when pressed by the hand not to fall asunder at once. The beds may be made of a width of 4 feet, and of any desired length. Let the manure be made firm by trampling and beating it, finishing off the top in a rounded fashion, or sloping like a saddle-roof. At first there will be a high temperature in the beds, which in a few days will fall to 80°, at which point the beds will be fit for spawning. In doing this, push pieces of spawn 1 inch square a little way into the manure, and cover with the manure, the pieces being placed in rows running across the beds at 8 inches apart. Having spawned the beds, cover them with mats or clean straw for a period of about eight days, when they should be covered thinly with good garden loam beaten rather firmly, so that it will not slip off; then put a covering of 1 foot thick stable-litter over all to conserve the heat of the dung, letting this be about 65°. Mushrooms should appear in from six to seven weeks from the date of spawning a bed.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Strawberry Runners.—If new plantations are contemplated, the layers should forthwith be laid on the soil, or on bits of dead turf, or if it be liked, in 60-sized pots. Whichever be the method, it is essential, if fruit is to be picked next year, to layer as early as it is possible to obtain the runners. Unless plants are scarce, employ only the first plantlet on a runner, and nip off the runner beyond the first layered. If the space between the rows admits of its being done without crowding the runners and the mother-plants, turn the runners from two rows into the alley between the two rows, and layer them there, as by doing this the workman in gathering fruit, affording water, and generally in attending to the layers, need not tread on them. Layers may be kept in position by means of wooden hooks or bits of stone, and perhaps the latter is best, on account of its keeping the soil moist at the point of contact with the runner. Provided the land for the new bed has been got in readiness, the rooted runners need not remain attached to the mother-plants after sufficient roots have pushed into the soil to support the new plants, but they may be planted forthwith. In dry weather the runners must be afforded water, but once the turves are properly soaked, not so much water is required as by layers in pots.

Packing the Fruit.—Strawberries for despatching a distance should be perfectly dry when gathered, and boxes made 2 inches deep inside, and all of one width and length are best for packing in, as these can be tied together to form one package when several are sent. A thin layer of the best wood-wool should be put into the bottom of each, over this a sheet of tissue-paper, and each fruit should be wrapped in a soft Strawberry leaflet, or a bit of Vine-leaf. Damage often arises in transit from the stems bruising the fruit, and the stems should in all cases be carefully placed at the bottom of the box. A covering of Vine or Strawberry leaves should be put over all, then a sheet of tissue-paper, and finally a sheet or two of wadding to prevent the movement of the fruits in transit. For sending by post the best wood-wool is the only kind of packing material I have found to give satisfaction, as it permits of less movement than wadding, however firmly the latter is packed. Wooden boxes, or those made of other materials that possess any kind of odour must on no account be used, and the best are made of Poplar, Plane, Willow, or the like.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Woolverstone Park, Ipswich.

Adiantum cuneatum.—These plants may be cut over closely, and then stood in a cool frame or pit, and the amount of water afforded much reduced, in order to rest them for a few weeks. When they are started anew into growth, bring them into warmer quarters, and afford weak manure-water once a week, or less often, as may seem desirable; they will make nice plants by the autumn. Any that are much pot-bound may be shifted, and others may be split up if more are required. *Adiantum cuneatum* growing freely should be merely shaded slightly during the hottest part of the day, the fronds from such plants lasting in a fresh condition longer than those taken from heavily shaded plants. Plants from spores often found on damp walls and the floors of stoves may be placed in pans or in thumb-pots to grow on for future use.

Asplenium viviparum.—For indoor decorative work, this easily grown and very ornamental species should be commonly grown in gardens, and the present is a suitable season to remove the plantlets from the fronds, and place them in pans or in shallow boxes filled with a mixture consisting of leaf-mould and silver-sand. After pricking out and gently affording water, stand them in a moist, warm, shady pit, and by the end of the month of September they will have grown large enough to pot into thumbs and small 60's.

Gloxinias.—Any of the well-rooted seedlings now standing in 60's may be shifted into 48's, using for them a mixture of peat one-half, leaf-mould one-fourth, loam one-fourth, and plenty of sand and good drainage. Keep the tuber one-third of its height above the soil, and pot with moderate firmness. After repotting, keep close, moist, and warm, but do not syringe them, and before any plant is brought into a cool-house, let it be gradually inured to a lower temperature. Gloxinias always require shade from bright sunshine, and careful ventilation, and to be kept clear of Thrips and red-spider—their two worst enemies, and for this purpose vaporisation or fumigation must be resorted to. Plants gone out of flower should be afforded less water, and be eventually dried off.

Caladiums.—*C. argyrites* showing signs of having passed its best should be brought to a state of rest by very gradual drying off. The tubers of *C. argyrites* should not be kept, while at rest, in a parched condition, or they will perish. It is prudent to make an examination of the tubers at intervals, and afford the soil water sufficient in quantity to prevent excessive dryness in the tubers. Varieties of larger growth may be repotted into larger pots if an increase of size be desired. Afford them a slight amount of shade during bright sunshine, with day heat of 80°, and a few degrees more at closing time, and a night temperature of 68° to 70°, with plenty of aerial moisture and no stint at the root.

RAINFALL IN CEYLON.—On December 16 last at Newenkuni, 122 feet above sea-level, 31.72 inches of rain were measured within twenty-four hours. No wonder we read also of floods and other disasters. Newenkuni must have been the centre of a cyclonic disturbance. The *Tropical Agriculturist* of Ceylon gives numerous details in confirmation of this extraordinary rainfall.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Roses at the Crystal Palace.

The National Rose Society on Saturday last once again called its loyal members together, to take their part in the annual metropolitan competitive exhibition of the queenly flower it is the Society's life-work to encourage, popularise, admire—yea, and seek to improve. That every member does his best to exhibit, and does his very best when in the act of exhibiting, is true every year, and consequently of 1898. But the result is not always equally satisfactory. To make a grand exhibition in an unfavourable season is more than the National Society's resources can accomplish, and in such a year as 1898, the knowledge that he has done his best, has met his fellow Rose-cultivators in the annual gathering, has told his tale of incessant struggling against unkindly climatic influences, and has heard the similar tale of others—this is the Rose-exhibitor's chief source of satisfaction. It is pleasant to write that the event of Saturday was satisfactory from quite another standpoint, for the exhibition itself was a good one.

The anxiety felt during May and the greater part of June was very great, and ill to bear. It was occasioned by the extraordinary characteristics of the weather. May was less kind than March, and June was but a little warmer than April. Winds were as prevalent as sunless days. Cultivators inquired of each other

upon the prospects of the Rose season; and our own columns have contained several articles upon the subject. Everywhere was given the same answer, "late! late!"

It was about the time of the Bath Show that the general feeling of uncertainty was displaced by more optimistic forecasts. The words of a large trade grower then were these, "Yes, the blooms will be late, but they will be good; we shall have a good though late Rose season, and the hybrid Teas especially look exceedingly promising." Events have proved this view to have been very nearly correct. There was very little disappointment at the Crystal Palace, and it was heavily counterbalanced by a most opposite feeling. There was good competition, very few classes indeed failing in this respect. The following instances illustrate what a large number of Roses were shown in one class alone. In that for forty varieties in trebles (nurserymen), there were six exhibitors, and together they staged 720 blooms. Again, there were five competitors in the class for seventy-two blooms, distinct varieties (nurserymen), there being accordingly 360 blooms in the class. In the fight for the championship, Bedale and Hitchin have again given way before Colchester. Messrs. HARKNESS & SONS, who have held the trophy during the past two seasons, having this year failed before the veteran grower, Mr. B. R. CANT, and the second aspirants for the honour, also from Colchester, were Messrs. F. CANT & Co. The Colchester firms secured a very large share indeed of the spoils. Mr. B. R. CANT's collection of seventy-two blooms was a good one, and worthy of winning the much coveted prize awarded it. This season has seen Mr. C. TURNER a little closer to the front than of late. He was the first-prize exhibitor in the class for twenty-four blooms distinct, and showed a collection that we considered to be the best in quality of any collection in the show.

The Teas and Noisette Roses were good in size and substance, but occasionally suffered a little by disfigurement from rains. The only fault we had to find with the Teas was this lack of finish or refinement, and that only in some cases. The hybrid Teas were shown well, and it is beyond doubt that some of the prettiest Roses in cultivation have been pressed into service in this section. If we recall a Rose exhibition of a dozen years ago, we shall the better appreciate the handsome and distinct effect, also the gorgeous colouring that Saturday's show obtained from the varieties Mrs. W. G. Sharman Crawford, Mrs. W. J. Grant, and Comtesse de Nadaillac. In exhibits of trebles it could hardly escape the notice of anyone, that in almost all the classes there was the brilliant colour of Mrs. W. J. Grant, the three blooms being the first the eye would rest upon. The prettily-tinted Comtesse de Nadaillac was awarded the Silver Medal in both the nurserymen and amateur section, as being the best Tea or Noisette bloom in either case. In the former case it was shown by Mr. GEO. PRINCE, in the latter by Mr. A. HILL GRAY.

Medal Roses of the H.-P. section were Mrs. Jno. Laing and Gustave Piganeau. How frequently BENNETT's best Rose—Mrs. Jno. Laing—has obtained the Medal for the best H.-P. bloom! It was shown on this occasion by Mr. E. B. LINDSELL; and Messrs. TOWNSEND & SONS had the honour of the Medal for Gustave Piganeau. The Medals to Hybrid Teas were awarded to White Lady shown by Mr. C. J. GRAHAME (whose liberality in offering so many special prizes has been generally appreciated), and

to Mrs. W. J. Grant, from Messrs. PAUL & SON. Messrs. A. DICKSON & SONS competition for the best twelve Roses sent out by this firm again served to show how many fine Roses have emanated from this Irish nursery; but it is curious that Messrs. DICKSONS themselves should elect to compete in the class. They did, however, and were awarded first prize.

The date of the Palace Show was very suitable to the display of the pretty and showy garden-Roses. Messrs. PAUL's exhibit of thirty-six distinct varieties was a very fine one, and they were staged with such good taste and finish as would be difficult to excel. But this much goes without saying when we add that the collection obtaining second place was one from Messrs. GEO. COOLING & SONS, Bath, who so generally show Roses of this section in fine condition. Several new garden-Roses in Messrs. PAUL's exhibit are alluded to in our detailed report in another column. There were no many absolutely new Roses at the Palace. The Society's Gold Medal was awarded to the seedling hybrid Tea known as Purity, shown by Messrs. COOLING & SONS. It may be remembered that this variety received a card of commendation last season from the National Rose Society at the Portsmouth meeting. The Society has now given the highest award in its power to bestow. Messrs. PAUL showed their hybrid Rose Una, but it failed to obtain even a card of commendation.

In the amateurs' division there was generally good competition, and satisfactory quality. It is a fact that several well-known amateurs found the date of the show too early for them—a week later would have made all the difference. We emphasise the fact that the general quality was good, but it did not compare so favourably with that in the trade exhibits, as has been observed on many previous occasions. No one will grudge, and all will congratulate, Mr. E. B. LINDSELL, who had again the honour of winning the amateurs' championship trophy offered for the best collection of thirty-six distinct varieties. Mr. LINDSELL has now proved himself the champion grower for the seventh time in the last ten years. The winners in the three years when he was unsuccessful were the Rev. J. H. PEMBERTON, who is generally a little late for this show, and Messrs. S. P. BUDD and W. J. GRANT. Mr. LINDSELL's county is Hertfordshire, the Rev. PEMBERTON's Essex, Mr. BUDD's Somerset, and Mr. GRANT's was Hereford.

The amateur championship for Teas and Noisettes was won by Mr. A. HILL GRAY, the winner of this honour on the two previous occasions having been Mr. O. G. ORPEN, of Colchester. Mr. A. TATE, of Leatherhead, had the best garden Roses. The system of grouping the exhibitors into classes according to the resources of each, continues to work well, it tending to encourage cultivators to stage blooms, who under other conditions could scarcely hope to win a prize at all.

The nave of the Palace being available on Saturday, the Roses were staged once again in the manner that is apparently the most generally popular. The Palace show was a most enjoyable event, and everyone appeared in good spirits, including the venerable secretary, the Rev. H. H. D'OMBRAIN, whom all were pleased to see present. Mr. D'OMBRAIN was assisted in his work by Mr. ED. MAWLEY, hon. secretary, and Mr. GEO. BUNYARD. All eyes now turn to Halifax. There, the growers in the later districts will have their chance. May they equally well acquit themselves.

On Tuesday last the Council of the Royal Horticultural Society renewed the graceful invitation to the Committees which gave so much satisfaction last year. It is not necessary to point out to the frequent visitors to the Drill Hall in what the work of the several committees consists, but for the sake of those at a distance, who are not familiar with the working of the Society, it may be desirable to allude to the subject. Throughout the year the committees meet every fortnight, and give up the day

imminent, the committees continued their work as zealously as they do now under happier auspices. The Society is clearly under great obligations to the committees, and the Council did well to take an opportunity of expressing their recognition of the fact. Sir TREVOR LAWRENCE, a stalwart, who stuck to the Society in its evil days, and is never wanting when work is to be done, occupied the chair, and expressed his sense of the work done by the committees, whom he designated as the backbone of the Society. Sir TREVOR threw out the suggestion that

throughout, and had proved themselves as the President had said, the backbone of the society. Mr. DYER alluded to the first Temple Show, an undertaking initiated with some apprehension. The Covent Garden growers and others were approached on the subject, and readily responded, and so the first Temple Show proved a success, and subsequent gatherings, favoured by weather, have been increasingly successful.

Alluding to the forthcoming Paris Exhibition of 1900, Mr. THISELTON-DYER threw out the suggestion that our fruit-growers should send

FIG. 9. STANHOPEA RODIGASIANA: NEW SPS. (SEE P. 32.)

without fee or reward, to the business of the Society. They pass in review all the exhibits entered for certificates, and assess their merits with judgment and impartiality. That they do not always give universal satisfaction is to say that they are hard-working human beings. It is only the idlers who are never wrong, and most of us would prefer to be occasionally wrong with the conscientious hard-workers, than negatively right with those who do nothing. The committees, moreover, supervise the numerous trials made in the experimental garden at Chiswick. In the old days of gloom and depression when ruin seemed

sooner or later it would be necessary to seek some other spot for an experimental garden, the present garden being too limited in area, too much built in, and the soil more or less exhausted. Sir TREVOR concluded his speech by drinking to the health of the committees, and calling upon Mr. THISELTON-DYER, the Director of the Royal Gardens, Kew, to respond.

Mr. DYER in reply, made a graceful and sympathetic speech, alluding to the evil days at South Kensington, and to the vigorous efforts (in which Mr. DYER himself had no small part), which were necessary to reinstate the society. The committees also had stuck to the society

periodically specimens of their produce, as it was abundantly clear that English-grown fruit was, as a rule, infinitely superior to that grown on the continent.

After a vote of thanks to the President, the members dispersed to inspect the garden. Want of rain is manifested in every part of the garden. There was a parched-up appearance on every hand, and it would seem that this particular part of the county has had a smaller rainfall than adjacent districts.

The trial of Tea Roses, which proved so successful last year, is continued, and there is also repeated a border of early-flowering

Chrysanthemums. In one of the flower-beds by the side of the walk leading from the great vinery to the Sutton Court Road, there is a bed of a compact, well-formed, yellow-flowered type of *Zinnia Haageana imbricata*, which promises to form a very pleasing feature. Those interested in perennial *Campanulas* will find a considerable number of species in flower on the rock-work. The white *Solanum Balbisii* is to be found in a bed near the Council Chamber. Many subjects such as zonal *Pelargoniums*, &c. are planted out, and will doubtless engage the attention of the Floral Committee by-and-by.

Under glass there is a comprehensive trial of *Cannas* coming on, which will repay inspection. A fine collection of *Gloxinias* are past their best, but they have been very striking. *Lantanas*, *Fuchsias*, *Heliotropes*, &c., are also to be seen in collections. In the frames Mr. WRIGHT has a number of seedling plants of *Dabeocia*, *Ledum*, and *Eucryphia pinnatifida* he has raised, which will probably be distributed to the Fellows in due course.

In one house can be seen growing on the roof a new and very beautiful *Passion-flower* raised from seeds from British Guiana, supplied Dr. MASTERS. The propagating-pit has been re-roofed, and Mr. WRIGHT speaks in the highest terms of its usefulness and adaptability.

The Vegetables and Fruit are alluded to in another column.

STANTHOPEA RODIGASIANA.—On June 28, Sir T. LAWRENCE, Bart., exhibited the remarkable *Stanthopea Rodigasiana* (fig. 9, p. 31), which illustrates a new section of the genus. The plant possessed one expanded flower, and one unopened flower-bud; and, as is usual in *Stanthopeas*, these were attached to a pendent stalk of about 1 foot in length. The prevailing colour of the flower is creamy-white, with dense purple spots on the sepals and petals; that of the lip is pinkish, excepting in the middle area, where the prevailing colour is repeated; and at the base, where it is blackish-purple. The reverse of the petals and sepals abounds with light-brown coloured spots. For a full description of this striking novelty, see p. 14 in our issue for July 2.

ROYAL HORTICULTURAL SOCIETY.—The next fruit and floral meetings of the Royal Horticultural Society will be held on Tuesday, July 12, in the Drill Hall, James Street, Westminster, 1 to 5 p.m. On this occasion special prizes will be offered for Roses; and at 3 o'clock a lecture on "Edible Peas" will be given by Mr. N. N. SHERWOOD, V.M.H.

HORTICULTURAL CLUB.—The annual excursion, to which ladies are invited, is fixed for Tuesday, July 19:—Members will meet at the first-class waiting-room of the Great Western Railway at Paddington at 9.45, and will proceed in a saloon-carriage to Slough by the 10 o'clock train, where carriages will be waiting for them; they will then drive to the village of Stoke Pogis, in the churchyard which the poet GRAY is buried, and if time permits go through the gardens of Stoke Park. They will then proceed to Mr. VEITCH's residence, East Burnham Park, where luncheon will be provided for them; after luncheon they will proceed through Burnham Beeches to Dropmore, and then return through Burnham Beeches to Mr. VEITCH's to tea, returning from Slough by the 7.38 train. It is estimated that the cost will be 9s each. Each member is entitled to bring one friend, lady or gentleman. Members wishing to join the excursion will kindly announce their intention to HARRY J. VEITCH, Esq., Royal Exotic Nursery, King's Road, Chelsea, by July 9, forwarding at the same time, to save trouble, the amount of ticket or tickets.

NATIONAL CARNATION AND PICOTEE SOCIETY (POSTPONEMENT).—We are asked to state that in consequence of the backward character of the season, the Southern Show, which is to be held at the Crystal Palace, has been postponed from July 20 to July 27.

YORKSHIRE NATURALISTS' UNION.—The 139th meeting will be held at Leyburn, for Jervaulx Abbey, this day, Saturday, July 9, 1898. The district to be investigated—with Jervaulx Abbey as a centre, includes the lower portion of Wensleydale, from Leyburn to Masham, an area which seems never to have been systematically worked in any department of natural history. The lists and notes which have been published in respect of the Wensleydale flora and fauna have either been for the upper portions of the dale, to which attention has been paid by FOTHERGILL, BAKER, PERCIVAL, and LEES, or for the neighbourhood of Masham lower down, which has been well worked by Mr. JAMES CARTER and his sons. The Jervaulx tract therefore seems a perfect blank in our knowledge of the distribution of Yorkshire plants and animals, and one likely to amply repay investigation. Routes: All parties will drive from Leyburn to Jervaulx, the conveyances starting from the station immediately on arrival of the 11.36 A.M. train. I. The general body of naturalists, led by Mr. HARTSHORN and others, will explore the neighbourhood of Jervaulx Abbey, the conveyances returning to Leyburn at 4 p.m. II. The geologists, led by Mr. W. HORNE, F.G.S., will accompany the first party to Jervaulx, but will leave at 3 o'clock for Harby Quarries. Admission to Jervaulx Abbey Grounds: Arrangements have been made for free admission to members showing their cards. Without cards the ordinary fee of 6d. will be charged. On this occasion the botanists have the unusual advantage of a virgin field for exploration, as there do not appear to be any published records for the immediate neighbourhood of Jervaulx Abbey, not even in BAKER's *North Yorkshire*, nor in PERCIVAL's *Flora of Wensleydale*, which appeared in the *Naturalist* for 1888. Mr. W. SCOTT, the gardener at Jervaulx Abbey, mentions that *Echium plantagineum*, which grows in the Abbey ruins, several Ferns, and *Typha latifolia*, mentioned by W. G. M. JONES BARKER as growing near Jervaulx, are the only noteworthy forms met with in the immediate neighbourhood.

DR. GEORGE BAUR.—Science, writes Mr. BORTING HEMSLEY, has lost another devoted servant in the person of GEORGE BAUR. He was for some time Professor of Osteology and Palaeontology in the University of Chicago, but his name has been more prominently before men of science during the last few years in connection with the origin and natural history of the Galapagos Islands than with his position in the University. He was an enthusiastic worker, but illness overtook him, and he returned to his native country for rest and recovery. This was denied him, and he died on the 25th ult., after much suffering. During the last few years he wrote and lectured much against the theory that the Galapagos originated by upheaval from the ocean; and although his views met with contemptuous rejection in certain quarters, there is no doubt that biological evidence is strongly in his favour. I may, says Mr. HEMSLEY, perhaps have an opportunity of laying further particulars of this interesting subject before the readers of the *Gardeners' Chronicle*.

TWIN CUCUMBER.—We have received from Mr. R. REYNOLDS, Cliff Lodge, Hyde Park, Leeds, a typical specimen of a twin Cucumber. This union of two fruits longitudinally, the result of two flowers being united at a very early stage, is by no means uncommon, as the large number of instances sent to this office sufficiently testify. Our thanks are also due to our correspondent for several photographs of the fruits.

THE FLORIDA VELVET BEAN.—Captain E. A. WILSON, of Orlando, Florida, has sent us a few specimens of the seeds of some leguminous plant, perhaps a species of *Mucuna*. The seeds themselves are prettily marked, and we learn that some of them are in growth at Kew, so that we shall, in due time, learn the species to which they belong. The plant is said to be "invaluable for all kinds of stock as a forage, and a phenomenal fertiliser for Orange and other fruit trees." We omit the other laudatory descrip-

tions, because, even assuming them to be justified in Florida, we could not expect them to be so here. The analysis of the Bean is as remarkable as the rest of the description—"Nitrogen, 54 per cent.; crude protein, 19; fat, 6; fibre, 8; moisture, 12."

COMING OF AGE FESTIVITIES AT STOURBRIDGE.—The coming of age of Mr. E. STANLEY WEBB—eldest son of Mr. EDWARD WEBB—was celebrated on Saturday afternoon, June 25, Mr. and Mrs. WEBB having invited the staff of Messrs. WEBB & SONS to their residence, Studley Court, Stourbridge. There were about 400 present, including the staff from Wordsley and the workpeople from the Kinver seed farms, also the managers from the chemical works at Chester. Fine weather prevailed, and the visitors were enabled to spend a very pleasant time. A variety of games was provided for their amusement, whilst many availed themselves of boating on the lake. The house and grounds were open, and in the early part of the proceedings afternoon tea was served. The band of the 2nd Batt. Bedfordshire Regt. gave great pleasure by their performances. Dinner was served in a marquee, after Mr. W. W. WYLD, on behalf of the staff, presented Mr. STANLEY WEBB with an illuminated address, together with several articles, including a travelling bag, dressing-case, hunting-crop, sandwich-case, &c. Mr. STANLEY WEBB in responding, said he could not sufficiently thank them for the kindly feeling towards him as expressed in the address, and he also acknowledged his indebtedness to them for the assistance they had given him since his connection with the business. "Success to the Firm" was proposed by Mr. J. W. BERRINGTON, who referred to the great abilities and untiring energies of the firm—Col. WEBB and Mr. EDWARD WEBB. They always kept the business abreast with the times. Every year saw some new development. Col. WEBB in replying said, great as the business was, wonderful as the growth had been, he confidently looked forward to even greater progress in the future.

A METHOD OF TRAPPING ANTS.—We read in one of Mr. HARMSWORTH's little magazines the other day of a ready means of catching ants. It is to take a large sponge and sprinkle it well with moist or pounded loaf sugar, and set in the vicinity of the ant's nest. These little troublesome creatures eat sugar with avidity, and soon swarm all over and in the interstices of the sponge. When this is noticed throw the sponge into boiling water and let it remain for a few minutes. Then wash out the dead ants, sprinkle the sponge with sugar, and lay it as before. If this be persevered in for a few days every ant will be destroyed.

CAMBRIDGE BOTANIC GARDEN.—In the annual report of the Botanic Garden Syndicate, it is stated that during the past year 2284 plants, 6026 bulbs, and 2830 packets of seed have been received. Contributions have been received from numerous botanic gardens, and a return has been made to most of them, 2426 plants and 3230 packets of seeds having been distributed. Among the more interesting and important plants received are *Tmesipteris tannensis*, an ally of *Psilotum*, of which little recently was known; *Hemitelia capensis*, a much desired Tree-Fern; *Polypodium Schneideri*, a remarkable hybrid Fern; *Coryanthes macrantha*, an Orchid with extraordinary means for securing cross-fertilisation; *Augæum Eichlerianum*, and various other choice Orchids; *Aloe Lynchi*, Baker, a bi-generic hybrid; *Anemopaegma carterense*, a new *Bignonia*, described in the *Journal of Botany* for May, 1898, p. 188; *Echeveria Purpusii*, a new yellow-flowered species; *Gmelina hystrix*, *Bot. Mag.*, 1894, t. 7391, a very little-known plant of the order Verbenaceæ, from the Philippines; *Gunnera insignis*, a gigantic and remarkable new species; *Myriocarpa longipes*, a peculiar plant of the order Urticaceæ, with racemes nearly 5 feet in length; *Sechium edule*, the Chocho of the West Indies; *Trochetia Blackburniana* (*Bot. Mag.*, 1891, t. 7209), an additional genus, "one of the most

See paper "On the Structure of a Hybrid Fern," by Prof. J. B. FARMER, *Annals of Botany*, vol. xi., 1897, p. 533.

interesting genera of plants on account of its unique distribution; *Veronica macroura*, said to be a good acquisition; *Zizania aquatica* (Canada Rice), used as a cereal by North American Indians; and several new Somali-land plants introduced to the Cambridge Botanic Garden, among which may be mentioned one of a probably new genus; *Dorstenia arabica*, and *Senecio Gunnisii*, the two latter being very peculiar representatives of their respective genera. Among the plants of interest that have flowered are:—*Boea Clarkeana*, Hemsl., a new Gesneriad; *Aristolochia saccata*, an interesting species; *Pæonia Emodi*, a rare species of the Himalayas; *Richardia Pentlandi*, a handsome new species

phytum tenuifolium, and several other plants from Somali-land. Numerous hybrids among allies of the garden *Cineraria*, raised by Miss PERTZ and the Curator, have flowered, and were exhibited at meetings of the Royal Horticultural Society and Philosophical Society. The collection of Willows, numbering about eighty-four kinds, and complete as to British species, has had the advantage of revision by the Rev. EDWARD F. LINTON of Bournemouth. The plants have been duly labelled, and specimens have been dried for future reference. The number of specimens supplied for botanical purposes, including those that were put into alcohol, during the year ending with Lent term, amounts to about 80,000.

FIG. 10.—*CAMPANULA MIRABILIS*: COLOUR OF THE FLOWERS PALE BLUE. (NAT. SIZE.)

with a yellow spathe; *Iris bosniaca*, a new, bearded species; *Pleurothallis puberula*, Rolfe; *Mastdevallia muscosa*, one of the most curious of the species, and remarkable on account of its sensitive labellum; *Lycoris squamigera*, a handsome new border bulb with rosy-lilac flowers; *Calystegia affinis*, from Norfolk Island, regarded as a geographical form of our own *C. sepium*; *Stapelia gigantea* var., apparently a distinct form of this fine plant; *Crassula abyssinica*, a good addition to the succulent collection; *Chelidonium leptopodum*, Prain, a charming new species; *Solanum cornutum*, illustrated in the *Gardeners' Chronicle*, October 30, 1897; *Huernia somalica*, a new species introduced to the Cambridge garden by Mrs. Lort-Phillips; *Acidanthera Gunnisii*, a new and pretty white Irid collected by the same lady; *Cyperus obtusiflorus*; *Ocimum staminosum*, *Cloro-*

CAMPANULA MIRABILIS.

UNDER this name M. Correvon wrote in the year 1896 in the *Revue Horticole* of a species discovered in the Caucasus by M. Alboff, and described in the *Bulletin de l'Herbier Boissier*, t. 3, n. 5.

On the occasion of the last meeting of the Royal Horticultural Society, at the Drill Hall, S.W., a plant of this species was shown in flower (fig. 10) by Messrs. G. Jackman & Son, of Woking, which engaged the attention of most of the persons who saw it. The plant shown had a lax pyramidal habit, serrated orbicular leaves, with the general aspect of *Campanula medium*, and numerous flowers of a pale blue flower, or nearly of the hue of those of *C. carpatica*, and of about the same size.

HOME CORRESPONDENCE.

THE GARDENING CHARITIES.—In reply to Mr. Monro, as regards the Royal Benevolent Society, I can only say that I obtained, or did my best to obtain, from head-quarters, the fullest information before writing, and in all the papers and information received there was not one single word referring to the subscribers being sure of anything except a vote. If this is altered, and they are now sure of help if needed, then the whole matter is on a totally different basis, and it will be well that this should be known; perhaps Mr. Monro will be good enough to let me have the information officially. The fact that there are so very few subscribers amongst the gardeners shows that either I was correct in my statements, or Mr. Monro's further information is not known. If he will send me the confirmation of his statement, from an official source, I shall be pleased to send £20 to the Treasurer of the Royal Benevolent Institution. The only condition necessary is that every subscriber who is a gardener shall be absolutely certain that at least the amount of his payments, plus 2½ per cent. compound interest shall be guaranteed, if applied for, either at the age of, say, 65 or at death. He can get this from the Post-office Savings-bank, without charity, and he or his survivors should be able to claim it as an absolute right. This simple insurance scheme could easily be arranged. May I suggest to some correspondents that personal abuse proves nothing, and that I have yet to see the accounts of any gardeners' sick or provident club which will approach the Post-office Savings-bank as a means of providing for old age or sickness. The usual rule is in these societies that some 40 per cent. of the money subscribed goes in commissions, salaries, and expenses, and that nearly one half the money is therefore lost to the members. This is not so in the Royal Benevolent, but this Society does not fill the place of a club which is a certain fund to every member; it is good in its way, but it does not provide for the future of all who pay; it is a charity, pure and simple. One person states that I know nothing about gardeners or their wages. I know enough to be certain that it is one of the worst paid occupations, and that a man with equal skill and accumulated knowledge can make more money at almost any other kind of work. My object in writing was simply to call attention to the fact that the gardeners could, amongst themselves, start a club on sound lines, which would ensure their families enough to give them an opportunity to start again when the breadwinner was gone, whether they were in absolute poverty or not. My statements are, so far as the information supplied goes, simple facts, and it is in the interest of gardeners generally that I have taken the matter up; the figures supplied will be a revelation to most if not all who have read them. As a further mild criticism on the management of the minor insurance and friendly (so called) societies, it is interesting to learn from the Insurance blue book for 1896-97, that no fewer than forty-one have disappeared during the year, reported as either "gone" or in liquidation, and also that not one gardeners' society balance-sheet appears. As stated in the introduction, "publicity means death to the insolvent." Mr. Monro's letter is clear and to the point, and I hope mine is equally so; the only difference between us is that he is considering charity, I am considering provision for the future for all whether they are likely to need charity or not. *Thos. Fletcher, Grappenhall, Cheshire.*

—Owing to the courtesy of Mr. Thos. Fletcher in sending me a copy of his letter forwarded to you, I am able to reply to it in the same issue, and need not take up much of your space in doing so, as I can only argue on the basis of the Gardeners' Royal Benevolent Institution, as it is a "gardening charity" and not as Mr. Fletcher states it should be, an insurance or benefit society. It was never intended to be anything of the kind. I am very pleased to see Mr. Fletcher's generous offer of £20 to the Treasurer if I can prove what I stated, as the Institution will benefit to that amount. I am writing the Secretary on the matter, and if I overstated the case I will pay the amount. I am also glad to find that Mr. Fletcher is not a gardener, and that up to the present he has not found one to back up his criticism of the Institution, which goes far in my mind to prove that the gardeners do approve of the lines on which this charity is conducted. Mr. Fletcher's other remarks cover a wide field, and touch matters on which I cannot follow. *Geo. Monro, Covent Garden Market.*

— In reply to your request for official information as to the advantages to be gained by gardeners who subscribe to the Institution, I beg to refer you to, firstly, Rule III., 5, which provides that, gardeners who have been subscribers for fifteen years may, if in need and eligible for assistance, be placed on the funds without election at £20 a year, and this applies equally to the widows of such at the lesser sum of £16 a year. Secondly, to Rule III., 10, under which a candidate who has subscribed from four to fourteen years is credited with a certain number of votes in proportion to the number of years he has subscribed; and thirdly, to the "Victorian Era Fund," which is devoted exclusively to the benefit of subscribers, and from which a yearly sum is given to candidates according to the number of years' subscriptions, and until they are elected permanent pensioners. With regard to this latter fund, perhaps I cannot do better than give you the names of those candidates now on our list, the number of years they, or their late husbands subscribed, and the amount they will this year each receive:—

Name.	Number of years Subscribed.	Amount given for 1898.
Andrew Bryan ...	13 ...	£9 15 0
Francis Nixon ...	13 ...	9 15 0
James Plevy ...	12 ...	9 0 0
Geo. Staples ...	11 ...	8 5 0
Caroline Wood ...	11 ...	8 5 0
John Gibbons ...	10 ...	7 10 0

I might also refer you to the case of Eleanor Brown, formerly a pensioner on our funds, who died quite recently. Her late husband subscribed £1 ls. yearly for sixteen years. Being in need, he applied at the age of 76 for assistance, and he was placed on the pension list. He died in 1875, when his widow made application to succeed to the pension. Her application being eligible, she was put on the funds under Rule III., 13, and she continued to enjoy the pension until a few weeks ago. This case speaks for itself. The husband subscribed altogether £16 16s., and he and his wife between them received from the Institution no less a sum than £468! *George J. Ingram, Secretary.*

SCUTELLARIA ORIENTALIS VAR. PINNATIFIDA.—I raised my plant from seed collected in the Mountains of the Peloponnese, and the name was given me by Dr. Heldreich, so it is probably correct; otherwise it seems to coincide with the type as described in *Nicholson's Dictionary*. It is a very charming little Alpine. The bright yellow flowers stand well above the foliage, and as they all bloom at once they are very effective. Mr. Nicholson gives August as the flowering month, and my seedlings bloomed in August; but the fully-grown plant flowers in June. I notice that M. Correvon offers both seed and plants of the type, so it is within anyone's reach. *A. K. Bulley, West Kirby, June 26.*

DIXON'S MIDSUMMER BROCCOLI.—I do not know whether the variety of Broccoli mentioned by Mr. Burberry, p. 8, is in any way synonymous with the one we grow here under the above name. In any case it is an excellent variety for late consumption. At this place nice heads were cut on midsummer-day last, quite white, and very close in texture. This Broccoli has the, to me, desirable qualification that it is not over-large. The plants were grown on a north border, and were raised from seed sown at the end of the month of April, 1897. I got the seed from a gardening friend in Yorkshire, who told me that he first procured his stock from the old-established firm of seedsmen, Messrs. Dixon & Sons, Hull. *H. J. C., Grimston, Tadcaster.*

ARTIFICIAL MANURES.—The subject of artificial manures, when used with stable and farmyard manures, is so important that I need not apologise for referring to it again once more, and only once. "J. P." in the *Gardeners' Chronicle* of May 21, p. 317, relates that he uses, with satisfactory results, a mixture of artificial manures and animal manures. There seems, however, evidence to show that of two plots with the same crop, one manured with animal manures, and the other with a mixture of animal and artificial manures, the result was the same. Now if this be true, it would point to the fact that the

addition of artificial manures in such cases was useless and wasteful. Nitrates are used for the sake of their nitrogen, and if the German experiments prove that this nitrogen, in contact with dung, escapes in its elementary form, it would seem absurd to mix the two. "J. P.'s" experience is not sufficiently convincing, for it seems to lack scientific accuracy. He does not say that he has ever made any test experiments—that is, manuring one plot with animal manures only, and an equal plot, with the same crop, with his mixture, to ascertain whether there would be any difference in the result. On so important a subject it would seem the function of the two great royal societies—the agricultural and the horticultural—to make a series of accurate experiments to try and discover what truth, and how much of it, there is in "denitrification" by contact with animal manures. "J. P.'s" mixture might be used on one plot, and animal manures on a similar plot, and other variations. The soil and crop must be the same, and the previous crop should be noted, as it might affect the result. This important question cannot be solved by one experiment. A series of careful and accurate experiments will have to be made, in order to eliminate any sources of error. There was a profound practical notion that Potatoes must be earthing-up, in order to ensure a crop; and it was only the other day that at Chiswick the R.H.S. found that earthing-up and not earthing-up gave exactly the same result. What a waste of labour then has been for ages devoted to growing Potatoes by the earthing-up method! So it may be with many other conventional and traditional notions. Laboratory experiments conducted with all possible scientific accuracy are very useful, but they require to be tested and confirmed on a large scale in agricultural and horticultural operations, and these can be only done by the two Royal Societies. Experiments by private firms, and also by amateurs, may help to bring out the truth from what now appears a sort of tangle of contradictions. *E. Bonavia, M.D.*

THE SPARROW.—The above-named homely bird by its friends is considered to possess many virtues, and by its enemies is ranked as a most destructive bird, to be destroyed without mercy at all costs; but, as usual, the golden mean or moderate course I consider the best way of dealing with this hardy, active, cheerful bird. I have noticed on these last two days swarms of sparrows eating the caterpillars that are still on the Oak trees, and which have now entered the chrysalis stage. In the caterpillar or feeding stage, the sparrows did not seem to eat them; rooks and starlings seemed to be living on them, but now the rooks have gone to the farms for grubs, small Potatoes, &c., and the starlings for Cherries and the cattle-pastures and sheepfolds, and the sparrows, chaffinches, and titmice of various varieties are busy eating the chrysalis of the various looper caterpillar on forest and fruit trees, within 50 yards of where I noticed the sparrows so busy, both old and young, on the Oak trees. We have several good rows of Peas that are in bearing, and I have not noticed a single pod damaged by sparrows, that it seems they sometimes at least prefer insect food to pulse or grain. *R. M., Newbury, June 28.*

STERCULIA NEO-CALEDONICA.—The remarks on *Sterculia neo-caledonica* on p. 178 of your issue of March 26 last, interest me. The name appears to be a mistake, unless *austro-caledonica* is a mistake in *Bot. Mag.*, t. 7382. We have two plants of *S. austro-caledonica*, Hook. f. (*Bot. Mag.*), which grow well in the open in this garden, and flower every spring. The description given in the *Gardeners' Chronicle* applies entirely to our plant, with the exception that our leaves are only about 1 foot in diameter, as against "some 4 feet in diameter," and 2 feet in diameter of the *Bot. Mag.* The plants are singularly graceful, Aralia-like, and their crown of leaves is 4 or 5 feet in diameter. Perhaps "W. W." is referring to the crown as 4 feet in diameter, but the construction of the sentence would appear to be against this idea. *J. H. Maiden, Sydney.*

ANT DESTROYERS.—Noticing a reply to a correspondent's inquiry in last week's *Gardeners' Chronicle*, for a remedy for the extermination of ants in a Peach-house, allow me to call his attention to the Ballikrain Ant Destroyer, which he will find most effectual if used according to the directions accompanying it. A few years ago, this place was completely over-run with the voracious black ant, which played havoc with ripe fruit, and especially with Figs. I tried several remedies, but failed to reduce their numbers, until Mr. Hughes, the gar-

dener at Wentworth-Woodhouse, came to the rescue. His interesting letter in the *Gardeners' Chronicle* a few years ago showing how he succeeded in exterminating ants from glasshouses determined me to try the effects of the Ballikrain Ant Destroyer. Its use has rid me of these little plagues very effectually. Surely, it would pay the vendors, Messrs. Cross & Sons, Glasgow, to advertise the destroyer in the horticultural papers, as scarcely a week passes but that some one is enquiring in the gardening papers for an ant exterminator. *J. Easter, Nostell Priory Gardens.*

AN EXPLOSION OF WEED-KILLER.—A customer of ours, who a few days since purchased two tins of weed-killer, in the form of powder, from a local chemist, has reported the following extraordinary occurrence. For security he placed the unopened parcel containing the two tins on the top shelf of his conservatory, and on the afternoon of the second day later a loud explosion took place, the ends of both tins being blown out, and the contents scattered throughout the house, ruining practically the whole of the plants, many being dead within a day, and the remainder so badly scalded and disfigured that they will probably not survive. Whether the explosion was caused by sun heat, or whether—though the tins are apparently air-tight—atmospheric moisture had entered and caused a chemical combustion of the contents is unknown, but it would perhaps be well for users to provide against either contingency by keeping in a cool, dry place. *C. P. & Co.*

VINES AND RICHARDS' XL-ALL.—Having read in the *Gardeners' Chronicle* of July 2, A. J. Nightingale's experience with the use of XL-All vapouriser, I should like to state that I have used it very successfully for two years in a vinery planted with black Hamburgh, Foster's Seedling, black Alicante, and filled with a miscellaneous collection of plants. I have always found the vapour performed its work satisfactorily and without causing the slightest injury to any of the Vines or plants. I have used it in the plant-stove without damage to any plants. Perhaps your correspondent, "A. J. Nightingale," made a too-free use of it, which may account for the damage done. *E. H. Chitty, Chomely Lodge Gardens, Highgate.*

ESCALLONIA PHILIPPIANA.—A plant so named, now in bloom in a friend's garden, has deliciously sweet-scented white flowers. Has the new hybrid *Escallonia langleyensis* inherited this peculiarity? I do not find in *Nicholson's Dictionary* any allusion to a sweet-scented species. *W. Thomson, Bishop's Teignton.* [They are all more or less aromatic. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

Meeting of the Committees at Chiswick.

THE FLORAL COMMITTEE.

JULY 5.—The following members met at the gardens of the Society on the above date, viz., W. Marshall, Esq., chairman, W. Bain, E. Beckett, E. T. Cook, D. R. Crane, R. Dean, J. H. Fitt, J. Fraser, G. Gordon, H. Herbst, W. Howe, H. J. Jones, J. Laing, Senr., J. F. McLeod, H. B. May, C. E. Pearson, C. J. Salter, T. W. Sanders, H. Selfe Leonard, G. Stevens, Owen Thomas, and J. Walker.

The object of the meeting was to examine the Violas, of which there is a large number of varieties new and old. It must be admitted that the conditions at Chiswick are not favourable to such a trial. To do them justice they need a clear, open, airy spot, free from atmospheric impurities, and where there is a fairly stiff, gritty soil. Then, to still further accentuate the test, the varieties should be planted out in the autumn, and then, if of hardy constitution, they will become well established in the soil, and afford a fairly good estimate of their value. Violas planted out in spring do not afford a fair test by the first week in July. They have not become acclimatised to the somewhat antagonistic conditions which prevail at Chiswick; nor have they had time to become well established in the soil, so as to display their capabilities. Another advantage gained from autumn planting would be to afford a test of early flowering, for a race of early-blooming Violas of hardy constitution is badly wanted in the spring garden. It is to be hoped that before long the Society will be able to provide itself with a new garden in some open, breezy spot, where important trials can be carried out, in the assurance that the best results may be expected to follow.

The following varieties received three marks:—Iona, mauve and blue-black, one of the most striking varieties yet raised; Mrs. H. Bellamy, pale lavender and deep purple;

Marchioness, for compactness of habit, freedom of bloom purity and shape, the best white yet raised; Bullion, for its earliness and persistency among the yellow Violas; Countess of Hopetoun, an old but very useful white, much employed for bedding purposes; Sir Robert Puller, a large purple variety, a strong grower; J. B. Riding, pale, mauve-claret; Jack-a-napes, yellow lower petals with crimson top, inferior in shape; Diana, pale lavender-blue; Wrayman, white, very like Countess of Hopetoun, but more compact habit; Mrs. C. F. Gordon, a great improvement upon Countess of Kintore, very handsome; Duchess of Fife; Haimish, claret lower petals, with pale top petals; Princess Louise, a small pale yellow of fine form; and Blue Gown, a very fine deep mauve bedding variety. Generally the Violas were suffering from drought in the light porous soil of Chiswick.

FRUIT AND VEGETABLE COMMITTEE.

The attendance of members was, for Chiswick, unusually large, and included Mr. P. Crowley, chairman, Rev. W. Wilks, secretary, and Messrs. H. Balderson, G. Bunyard, A. F. Barron, W. Bates, J. Cheal, W. Crump, A. Dean, W. H. Divers, W. Farr, R. Fyfe, C. Herrin, J. Laing, F. Q. Lane, G. Norman, R. Parker, W. Pope, W. Poupert, J. Smith, J. H. Veitch, H. W. Ward, J. Willard, G. Woodward, and G. Wythes.

An odd exhibit, to which attention was called, was a number of Mallett's patent market sieves and pecks, made of narrow strips of wood, with small openings between for ventilation, fixed into stout flat hoops, top and bottom, the bottoms resembling those of bent-wood chairs, numerous perforated with holes, also for air. They are very stout and enduring, and much superior articles for fruit transit than are the usual wicker-made round baskets of the London markets. The price was not stated. The patent baskets were sent through Mr. G. Bunyard, and are said to be of Russian make. Their value for marketing largely depends on price. It was agreed to leave a few of each size to be used in the gardens for trial; certainly the best test would have been made by some market gardener.

Messrs. LAXTON & SONS exhibited fruits of the new Strawberry Thos. Laxton, the product of a cross between Jas. Veitch and Royal Sovereign. The fruits, which were of good size and colour, seemed to favour the first-named parent mostly. The large fruits were mellow, but flavour was lacking; also were submitted some very fine rich-coloured fruits, and a plant lifted from the ground of Mentmore, a variety that obtained an Award of Merit last year at Chiswick, when it was so good. This is from a cross between Noble and British Queen. The product is a very firm, solid, fine, rich-coloured fruit, that is, as acid as Sir C. Napier, but it has little flavour; evidently it will make a capital traveller. The Strawberries growing in the gardens seem to have suffered firstly from the late spring-frosts, and secondly from lack of moisture; as, the soil is naturally so porous, that nearly all the plants seemed to be flagging. Several new varieties were examined; the only one which received an Award was Laxton's Bernard. The fruits are of middle size, distinctly plum-shaped, rich in colour, and of excellent flavour. It is evidently a good cropper. This received an Award of Merit. Thos. Carlyle (Laxton) was a high-flavoured variety; but the present season's crop, from the causes named, was not good enough to entitle the variety to an Award. Several excellent breadths of Cabbage and Cos Lettuces were seen. An Award of Merit was given to Crystal Palace, a curled and firm-hearted Cabbage Lettuce. No other award was made; but amongst others, the stock of Hicks' Hardy White Cos was much admired.

Peas were the worst lot seen here at any time; growth has been singularly bad, although the ground had been deeply worked and manured, and the sowings were thin. The statement of the President at the luncheon, that the garden seemed to be worn out, so far as certain produce was concerned, is well sustained by the appearance of the Peas this season; but it seems probable that a very special cause of the indifferent growth of some things is more due to the garden's atmosphere and surroundings than to even the worn nature of the soil. The early Peas only were fit for examination. The best were Dickson's Harbinger, 3 ft., a capital and nice-flavoured variety. An Award of Merit was given to Thos. Laxton, 5 feet high, an early Ne Plus Ultra; also to Drummond's New Pea, 6 feet in height, having a Telephone-like pod, containing sweet, green seeds. Veitch's Acme, 4 feet in height, first early, having medium-sized and well-filled pods, received a similar award; and that previously made to that excellent early variety Gradus was confirmed. It is to be feared that trials of Peas at Chiswick cannot be in future satisfactory, and it would be well if the Council would temporarily hire a few acres of ground in the country where good and satisfactory trials could be ensured.

ISLE OF WIGHT ROSE.

JUNE 20.—The annual exhibition was held in the picturesque grounds of Carisbrooke Castle on Coronation Day. In the open classes, Mr. B. R. CANT, Colchester, was 1st for a collection of twenty-four Roses, distinct varieties; and Messrs. F. CANT & Co. were 2nd. Messrs. F. CANT & Co. were 1st for twelve distinct Teas or Noisettes, for eight distinct varieties in trebles, for twelve blooms of any one variety, and for twelve bunches of garden-Roses. Mr. B. R. CANT secured the Silver Medal for the best Rose of any sort in the show, with Mrs. John Laing; and Mr. J. O. Brook was 1st in the amateurs' class for eighteen Roses, distinct varieties. In the Isle of Wight classes, Mrs. CROFT MURRAY secured the Isle of Wight Silver Challenge Cup for twenty-four distinct Roses. Major O. MOULTON BARRETT obtained the Queen's Gold Medal for twelve distinct Roses, and Mrs. CROFT MURRAY the Silver-gilt Medal for twelve distinct Teas.

NORFOLK AND NORWICH HORTICULTURAL ROSE SHOW.

JUNE 20.—The annual Rose show of the Norfolk and Norwich Horticultural Society was held on the above date in the picturesque Bracondale Woods, lent for the purpose by Mr. RUSSEL J. COLMAN.

Unfortunately for the entire success of what is always anticipated as a very attractive function, the weather was threatening nearly the whole of the day, and showers fell intermittently during the hours when the largest attendance is usually anticipated. The heavy rains of the last few weeks also militated against such an effective display as is generally seen at this show. Though the entries for Roses were quite as numerous as in the previous years, the number actually exhibited was much smaller. In many of the classes no award was made. Such exhibits as there were, however, constituted an attractive though small display.

The deficiency in respect to the Roses—the principal feature, of course, of the show—was amply compensated for by the fine collection of cut-flowers. The Committee had made a special effort to secure a large entry, by offering additional and special prizes, and they were rewarded by an entry that was a great deal better than any of recent years. The tent was a blaze of rich and delicate colours, and though assistance to the general effect was lent by professional exhibitors who did not compete, the Society is to be congratulated upon a very effective collection. This marquee was well patronised all the afternoon, and commanded the principal attention. The display of pot plants was inferior to that of previous years, but there was a fair show of Fuchsias and Pelargoniums.

In the Rose tent, Mr. B. R. CANT secured 1st prize for forty-eight blooms, though with an exhibit much inferior to his usual contribution. Messrs. F. CANT & SON were 2nd, the effect of the weather being especially noticeable on the outer petals.

For thirty-six blooms there was only one exhibitor, Miss PENRICE, of Witton, being awarded 2nd prize. A fine example of La France by this lady was, however, awarded the Medal for the best hybrid perpetual in the show.

In the class for twenty-four blooms, Mr. T. C. BLOFIELD was some way ahead of Col. ROUS.

For eighteen blooms, the Rev. A. FELLOWES was an easy 1st with a very fine lot, most of which belonged to the Tea or hybrid Tea section. One specimen in this collection was awarded the Medal for the Tea-scented class.

For twelve varieties, Mr. E. E. BOURCHIER secured highest honours. In the class for twelve blooms, open to amateurs only, Mrs. W. W. HAMMOND (Eyo), was 1st with some very good blooms, Teas again being well represented.

Messrs. PAUL & SON were 1st for twelve new Roses. Miss PENRICE, with some superb specimens of La France, secured the premier position in that class, and she also scored in the class for twelve Teas.

In the cut-flower tent, the class for hardy herbaceous perennials was a magnificent display; Messrs. BURRELL & Co., of Cambridge, were 1st; Mrs. PETRIE 2nd, and Mr. CHARLES JACOBI, of Ipswich, 3rd. All the usual classes were well filled with more than ordinarily good examples, stalks being strong, and blooms large. One of the principal exhibitors was Mr. R. C. NORCUTT, of Ipswich and Woodbridge, but he did not compete. This stand was one of the features of the tent, being a flame of varied colour, and containing horticultural examples that were as novel as they were attractive.

In this connection, it may be said generally that the show gained much from the liberal exhibits of local and other nurserymen, who helped to make less noticeable the extensive gaps in the competing entries, and furnished delightful collections of floral beauties that did much to redeem what would otherwise have been as a Rose show—something in the nature of a failure. As it was, the show was fairly successful. *Extract from the "East Anglian Times," July 1.*

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT.

JUNE 30.—Over fifty members and friends of the Isle of Wight Horticultural Improvement Association made a visit on the above date to Messrs. Sutton & Sons', of Reading. An inspection was made of the seed-stores, offices, warehouses, trial-grounds, greenhouses, &c. The hospitality extended to the visitors they now desire to acknowledge.

JULY 2.—The monthly meeting was held at Sandown, Mr. T. GIBBS being elected to the chair. The exhibits were numerous, and of first-rate quality, and were thrown open to the public free of charge during the afternoon.

Mr. A. COLE, Broadlands, Sandown, staged a group of miscellaneous flowering and foliage plants, and Mr. J. H. PERKIN, Los Altos, Sandown, staged a group of miscellaneous stove and greenhouse foliage and flowering plants, and a stand of Roses. Messrs. COLE and PERKIN were each awarded a Certificate for their excellent exhibits.

In the evening Mr. W. C. MOSELEY, of Bonchurch, read a paper on "Meteorology in relation to Gardening," which contained some invaluable advice to gardeners on the structure, uses, and management of thermometers, barometers, hygrometers, rain-gauges, and sunshine recorders. Mr. Moseley brought several meteorological instruments, and explained them in detail to a large audience.

Several new members were elected, the total number now being 270.

THE NATIONAL VIOLA.

JULY 2.—This modest society, which was established a few years ago by a few enthusiastic admirers and cultivators of Pansies and Violas, held its exhibition of blooms at the Crystal Palace on Saturday last. This could not be regarded as other than an unfortunate occurrence, seeing the abundant attractions the Rose has for everyone, and Saturday saw the festival of the National Rose Society at the same place.

The ordinary man cannot divide his affections, any more than he can serve two masters, hence the poor little display of the National Viola Society was not much visited, and by many would be passed by unnoticed. This, of course, is very sad, but it is the fate of most gardening fads that appeal to the few—not the many. The Royal Horticultural Society has sympathies wide enough to absorb most, if not all, the special societies; and fellows sufficiently interested in the particular flowers the specialists favour to insure the proper amount of attention being paid them. How poor and mean seems a Pansy when shown in a gigantic building as is the Crystal Palace!—a small tent erected on a cool green lawn, in the shade of fine trees, like the shows of Carnations we have sometimes seen at Chiswick, would be a far more suitable and congenial site.

The exhibits were shown on two tables, placed in front of the orchestra, and here were to be seen the stand of forty-eight sprays of Violas, distinct, set up by Messrs. ISAAC HOUSE & SON, of Westbury-on-Trym, Bristol, which received a 2nd prize only, and the additional award of a Silver Medal. The flowers were disposed in flat, triangular sprays of about a dozen blooms together, on a nearly erect stand, covered with dark-coloured velvet, so the adjuncts were favourable for setting off the colours of the Violas. Pretty varieties were noted in *Admiration*, deep blue with a dark centre; *Isa Fergusson*, dark-purple and deep violet, a telling combination of tints when viewed closely; *Hamish*, bright-purple; *Iona*, light blue, with darker blotches; *A. J. Rowberry*, the well-known yellow self; *Border-witch*, light-blue, and centre white; *Sheelah*, *Magie*, a good form, of rosy-purple tint, &c.

For twenty-four sprays of Violas, distinct, the best came from Mr. M. CAMPBELL, of Blantyre, N.B. These flowers had more substance than the south country blooms, and they were bigger and brighter. We remarked nice blooms of *Butterfly*, the three lower segments white, edged with purple, upper segments also purple; *Lord Salisbury*, a lemon-yellow-coloured bloom; *Dorothy Stokes*, white; *Stobhill Gem*, deep purple and light blue; and *Sissy Mellow*. Messrs. J. CHEAL & SONS, Crawley, took the 2nd place, having *Colleen Bawn*, *The Mearns*, *J. B. Riding*, *Duchess of Fife*, *White Duchess*, *Trentham Purple*, *Sweet Lavender*, &c. Compared with the northern flowers, these lacked substance and size. The 3rd prize fell to Mr. W. BAXTER, of Woking, who showed a pretty stand of self-coloured blooms, *Silver Barr* and *Nellie Barr*, *Endymion*, *Florizelle*, *Magnificent*, and *H. M. Stewart* being the more superior varieties.

Mr. CAMPBELL took 1st for twelve Violas, distinct, shown in glass cups, the varieties being similar to what he had shown in other classes; Messrs. I. HOUSE & SON taking 2nd place.

The best twelve sprays of Violas came from Mr. D. B. CRANE, of Highgate, 1st; and Messrs. I. HOUSE & SON, 2nd. The first-named had good blooms of *Pembroke*, a yellow self; *Devonshire*, creamy-white; *rosea pallida*, and *White Empress*. The 2nd prize winner had *Blue Gown*, *Cooper O'Fogo*, and *Florizelle*.

Mr. BAXTER, Woking, was awarded a First-class Certificate for *Endymion*, a fine yellow self Viola, of perfect outline.

Messrs. I. HOUSE & SON were 1st for twenty-four varieties of Violas, distinct, as shown in specimen glasses. Most of these varieties they had shown in other stands, the exception being *Christiana*, white; *Cissy Thornley*, purple and white; *Blue Cloud*, white, with thin blue edging; *Lady Leah*, *Flower of the Day*, *Acme*, a fine purple self; and *Peggy Smith*, a pleasing red-purple. 2nd, Mrs. C. C. LOWE, Ryhall, Stamford; excellent were *Lady Amory*, of two shades of purple; *Archie Grant*, *True Blue*, and *Bullion*.

The best twelve sprays of Violas, six blooms each, distinct varieties, were shown by Mr. D. B. CRANE; and in another class for six sprays, Mr. LEONARD BROWN was the exhibitor of the best flowers. In this lot were Mrs. C. F. GORDON, blue and white, very pretty; and Mrs. W. GREENWOOD, a yellow self of much merit. There were a few minor classes for Violas shown as sprays in glasses. Mr. D. B. CRANE was awarded a 2nd prize for six sprays of rayless varieties of Violas, showing *Devonshire Cream*, *Mary Scott*, *Pembroke*, *White Empress*, *Florizelle*, and another.

In a class for Violas having blooms not exceeding 1½ inch in diameter, Mr. L. BROWN won with *Bessie*, *Canary Bird*, and *Violetta*.

The Pansies.—Forty-eight sprays distinct, Mr. M. CAMPBELL of Blantyre, naturally came to the front with his fine large blooms of much substance, and appearing in all the beauty of tints we are accustomed to observe in Scottish Pansies. The finest blooms were J. B. IRVINE, John Menzies, D. RUSSEL, M. A. SCOTT, Mrs. W. STEELE, Jno. LAWRENCE. Mr. CAMPBELL was likewise 1st for twenty-four Pansies in distinct fancy varieties, among which we noted *Anne Ross*, *Sir J. Watson*, *Mrs. W. Watson*, *Marmion*, *D. Morrison*, *D. C. McKay*, and *Maggie Goodlet*; 2nd, Messrs. I. HOUSE & SON, in this instance the flowers were but little inferior to those from Scotland.

The finest twelve varieties of fancy Pansies were shown by Mr. CAMPBELL, amongst which were noticed extra good flowers of *G. Sprout*, *Col. Buchanan*, *Mrs. R. Stewart*,

B. Doulton, J. Menzies, and D. Johnstone. Messrs. HOUSE & SON took the 2nd position.

The best six distinct varieties of Pansies were shown by Mr. B. G. SINCLAIR, a London cultivator, consisting of nice examples of Ardwell Gem, Masterpiece, Norah May, Grace Blathorne, Countess of Kintore, and Lady Isabel.

Table decorations, in which Pansies and Violas formed the major portion, were not numerous, and most of them erred on the side of an undue use of the flowers, to the lamentable exclusion of greenery as a foil to colour in the former. The prettiest device was quite a small one, consisting chiefly of pale blue Violas, sparingly used, Smilax (Myrsiphyllum) and Maidenhair Fern. The chief exhibitor, if not the only one, was Mr. W. SYDENHAM, of Tamworth. This exhibitor obtained the National Viola Society's Gold Medal for an exhibit consisting of a large stand of Viola sprays, forty-eight in all.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

JUNE 25.—A good muster of members proceeded to the Redbraes Nurseries on Saturday, June 25, on the invitation of Mr. J. Grieve, to spend an evening among his Violas. The President, Mr. TODD, and many others, were present.

There was a very general consensus of opinion that, if you want to see the finest Violas in their most perfect form, you must see them growing in lines, beds, or borders in such a nursery as that of Messrs. J. Grieve & Sons. Here each variety, though repeating its merits or revealing its defects, renders either more apparent or pronounced, and few could carefully scan over 100 or more varieties of the best Violas without having learned a good deal more concerning them.

In addition to a large collection of named varieties, there are many hundreds of seedlings, and these have to satisfy the exigent owner of the nursery before they are honoured by a name. The "Father of Violas," as Mr. Grieve is very properly called, while cognisant of the merits of a flower, is also severe as a judge, and quick to discover blemishes and shortcomings. I cannot mention many names of varieties, but would only say that Joseph still maintains its popularity, and that Peter Barr, which hardly looks as if it were firmly and finally fixed in colour and quality, promises to become a rich and delicate flower. Raisers are hardly likely to be oblivious to the demand that is springing up in various directions for earlier and later-blooming Violas, with a more perpetual habit of flowering than our present race exhibits. We all recognise the influence for good or evil of soil and site, and of good methods of culture, on the development of the plants, and the fixing of all sorts of admirable qualities. Still, it seems quite possible to raise varieties of the Viola specially for early, late, and continuous blooming.

An inspection of the Violas absorbed most of the evening, although the visitors had time to note the large numbers of Carnations, Pinks, hardy herbaceous plants, Sweet Peas, Dahlias, &c., grown. Indoors, Tomatoes, Ferns, Palms, fine-foilage, furnishing and bedding plants, &c., were everywhere. I noted here, as elsewhere, that Pelargoniums are once more in the running among fashionable bedding and furnishing plants.

Mr. TODD conveyed the warmest thanks of the Association to Mr. GRIEVE for his genial and hospitable reception, happily comparing his position at Redbraes with Violas to the right of him, and Violas to the left of him, Violas in front, and Violas behind, to the Russian cannon converging on the fated Light Brigade at Balaclava. Mr. GRIEVE replied with a hearty welcome.

Mr. TODD brought an interesting exhibit to the meeting, a bunch of Sweet Peas, cut from his own garden in the open air at Musselburgh. They were sown in heat early in February, and planted out at the end of the month of May, staked at once, this staking being their sole protection. The flowers were as clean and spotless as if they had been grown under glass this cold late summer.

JULY 5.—An interesting meeting of the Society was held at 5, St. Andrew Square on the above date, Mr. M. TODD, the President, in the chair.

Among the exhibits shown were some fine blooms of the white and pink Souvenir de la Malmaison Carnations, shown by Mr. RUTHERFORD, Bridge of Allan, which were said by those who were present to equal any that were staged at the Royal Horticultural Society's Temple Show. A Cultural Certificate was awarded.

Also a collection of seedling Carnations by Mr. JOHN MINTY, Riverdene, Cookham, Berks, among which a white variety of great promise, named Nethridge, secured a First-class Certificate.

There was also an interesting collection of some hardy plants shown, including a double white and a semi-double white Clematis. The all too seldom seen—in the North—Buddleia globosa, the very pretty semi-Hawthorn-scented, white-flowering shrub—all too seldom seen in ferneries, rock-work, or the front row of shrubberies, Helichrysum rosmarinifolium—perhaps more generally known as Ozothamnus rosmarinifolium, a pretty name for this bright New Zealand shrub—which is considered to be scarcely hardy in Scotland. But here was a fine spike from a garden near Edinburgh, in full blossom, on the 5th of July.

In the absence of Mr. J. MCINTYRE, of Woodside Gardens, Darlington, the assistant secretary, Mr. G. H. MURRAY, read his paper on "Crotons."

Mr. FISH praised the brevity and lucidity of Mr. MCINTYRE's paper, in most of which he agreed, and made a few remarks on the change of names from Crotons to Codiaeums.

Mr. TODD, in moving a vote of thanks to Mr. MCINTYRE, referred to his experience of Crotons, in selling them, and how soon he found them become deciduous plants in his hands; and called upon Mr. THOMSON, as Director of the Royal Caledonian Horticultural Society, to give his impression of the first great Temple Show he had attended in London. This gentleman apologised for attempting to do what already had been so well and fully done by the Horticultural Press. He began by praising the place, which he described as grand. The fine crowded tents for a three days' show. The third point that seemed to have struck Mr. THOMSON most was that there were no money prizes offered or given, but nearly 100 awards in the form of gold and silver cups, medals, and certificates.

Then the Roses, Orchids, Fruits, Cacti, Rockeries, Cut Flowers, and the past, as it were, reappearing with the present, through several exhibits of hard-wooded plants, prominent among which were several of Leschenaultia biloba major, L. violacea, L. formosa. On the whole, the great show struck Mr. THOMSON as being singularly free from rubbish, and he hoped soon to see another—and, perhaps, a fruit show—at the Crystal Palace.

After a hearty vote of thanks to Mr. THOMSON and the President, it was announced that the Strawberry meet of the Association would be on Wednesday, July 20th, at 6 p.m., and the business meeting at 7.30—both at 5, St. Andrew Square. D. T. F.

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

JUNE 29.—An ordinary monthly meeting of the above Society was held on the above date in the Parish Room, Wargrave, Mr. W. POPE presiding.

Mr. T. HASKETT, gr. to J. W. RHODES, Esq., Hennerton, read a capital paper on "Roses." He referred specially to hybrid perpetuals and Teas, and advised intending Rose-growers to visit a good nursery in June or July to inspect the stock, when the various kinds and colours could be noted and chosen. A second way of obtaining good Roses was to propagate one's own by budding, grafting, or cuttings. The soil, method, and time of pruning, Rose-pests and their remedies, were in turn taken up, and a most profitable discussion afterwards took place, many members detailing their experience.

Mr. W. POPE, gr. to J. P. WHITE, Esq., of The Willows, was awarded a Certificate of Cultural Merit for a fine group of seedling Streptocarpus.

WITHAM HORTICULTURAL.

JUNE 28.—The second Annual Show of the Witham Horticultural Society was held in The Park, Witham, on the above-mentioned date in beautiful weather. The Committee, and Dr. Scott, the courteous Hon. Secretary, are to be complimented upon the excellent arrangements, and the success which attended their efforts to make the Show a success.

Cut-flowers were well shown in the open classes by Messrs. D. PRIOR & SON, Messrs. WALLACE & CO., both of Colchester, and Mr. S. KERRY, gr. to C. W. PARKER, Esq., Hatfield Priory, Witham, who took the prizes in the order in which their names appear for twenty-four varieties of hardy herbaceous flowers, which were well chosen and set-up in glasses. Mr. B. R. CANT, Colchester, was easily first for thirty-six Roses, distinct. Mr. H. GODFREY, gr. to Lord RAYDELIGH, was 1st for eighteen Roses; Lady DUCANE securing 1st honours for a good stand of twelve varieties of herbaceous flowers; being closely followed by Mr. S. KERRY, who was also 1st for six of Gloxinias, staging well-grown and evenly-flowered plants, and for a stand of twelve bunches of stove and greenhouse flowers, as well as for a collection of six kinds of vegetables, artistically arranged in a shallow circular basket, and which arrangement secured for Mr. KERRY special recognition, in addition to money prize offered for the produce so tastefully set up, as an inducement to other exhibitors to follow the example thus set them at future shows. The vegetables consisted of fine, even, clean tubers of Veitch's Ashleaf Kidney Potatoes, six weeks' Turnip, Carter's Perfection Tomato, Exonian Peas, Model Carrots, and Purple Artichokes.

Table decorations, button-holes, and sprays made a fine show in themselves, the flowers selected and the arrangement of same being everything that could be desired. H. W. W.

EDINBURGH FIELD NATURALISTS' AND MICROSCOPICAL.

JUNE 29.—The members of this Society paid a visit last week (Wednesday) to the Mushroom-beds in Scotland-Street Tunnel, Edinburgh.

The various features in connection with the method of Mushroom culture here were examined. The mycelium or spawn is supplied by a firm in London, embedded in small cakes composed of earth and manure, and the subsequent rapid increase of the spawn was noted with much interest. The tunnel, which was first used for its present purpose in 1887, after having been abandoned for twenty years by the railway company, is about three-quarters of a mile in length, and contains about 800 beds, each measuring 12 feet by 3 feet. On the beds Mushrooms at all stages of growth were seen, from the tiny button to the size most suitable for the market, and which requires about a month to reach maturity. Only the common Mush-

room (*Agaricus campestris*) is grown, and of it 5,000 lb. have been produced in a month. The Mushrooms are here raised under the most favourable conditions, and the greatest facilities are also afforded for their speedy transit by rail. Thus it was remarked that the Mushrooms partaken of at breakfast in London, had probably been ordered and despatched from Edinburgh the previous evening. Ten years ago Mushrooms were imported from France in quantities, and although the demand for them has now greatly increased, their importation has considerably diminished. This has come about to some extent on account of the large and constant supply from the Mushroom beds in Scotland-Street Tunnel, 60 feet under the pavement of a large city.

On the Saturday following (July 2) the society had an entomological excursion to Dalmeny Park, special attention being given to the Diptera, or two-winged flies, and a number of interesting specimens was collected. The captures in other orders of insects included a common blue butterfly, *Lycæna icarus*, an interesting species of brachelytrous beetle, found in a decaying tree-trunk, two species of humble-bee, one solitary bee (*Andrena*), two species of lace-wing fly (*Chrysopa*), &c. All the orders of insects were represented among the specimens collected.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 30.—At the last meeting of this Society at the Coal Exchange, Manchester, there were present Messrs. W. THOMPSON (in the chair), Shorland Ball, Hodgkinson, Greenwood, Leemann, Bolton, Backhouse, Cypher, Stevens, Johnson, and Mills (Hon. Sec.).

D. B. RAPPA, Esq., Liscard (gr. Mr. Nicholson), showed a very fine plant of *Cattleya Gaskelliana alba*, which was awarded a First-class Certificate. S. GRATRUX, Esq., Whalley Range (gr. Mr. McLeod), showed *Cattleya Wagneri*, with small flower, which the committee expressed a desire to see again when stronger; C. M. REINECKIANA (Award of Merit), and *Lælia tenebrosa*, with excellent dark lip, but a little weak in sepals and petals (Award of Merit). Mrs. BRIGGS-BURY, Accrington (gr. Mr. Wilkinson), showed *Lælia-Cattleya Fire King*, a magnificent form (First-class Certificate); *Cypripedium Gertrude Hollington*, one of the largest flowers we have seen of this variety (First-class Certificate); and *Odontoglossum crispum Marianne* (Award of Merit). O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers), showed *Cypripedium bellatulum album* (First-class Certificate). J. LEEMANN, Esq., Heaton Mersey (gr. Mr. Edge), showed *Lælia-Cattleya Arnoldiana*, very fine (First-class Certificate); *Odontoglossum Pescatorei album* (Award of Merit); *Cattleya Mendeli*, O. crispum, *Cypripedium T. W. Bond*, C. bellatulum, C. Hookeri Volanteum, and *Lælia grandis tenebrosa*. THOMAS STATTER, Esq., Whitefield (gr. Mr. Johnson), showed a very good form of *Cypripedium Conco-bellatulum* (Award of Merit), and *Lælia stilata* (*harpophylla* × *tenebrosa*).

WM. BOLTON, Esq., Warrington (gr. Mr. Cain), showed *Lælia tenebrosa*, *Cattleya gigas gigantea*, very fine flower (Award of Merit); *Cattleya Mossiae*, and *Cattleya species*, a very curious mottled flower in the way of Mossiae. The same exhibitor also showed two plants of *Odontoglossum crispum*, spotted varieties, one of which obtained an Award of Merit. W. H. ALMOND, Esq., Blackburn (gr. Mr. Hurst), showed *Cattleya Mossiae* and C. M. Ernesti. Mr. THOMAS HOLDEN, Royton, showed *Cattleya Mendeli*; Mr. JAMES CYPHER, Cheltenham, showed *Cattleya Mossiae delicatissima* (Award of Merit), C. Warneri, a very good dark form; *Thunia Winniana* (Award of Merit), *Odontoglossum maculatum* × *cordatum* (Award of Merit), and *Dendrobium Bensone majus*.

NATIONAL ROSE.

JULY 2.—The annual Metropolitan Exhibition of the National Rose Society was held on the above date, in glorious weather, at the Crystal Palace. The quality of the blooms was much better than it was feared a month ago would be the case, and generally the display was a very satisfactory one. On this occasion the nave was again available, and in this and the central transept were arranged the stands.

Mr. E. B. LINDSKILL won the Amateur's Champion Trophy, Mr. HILL GRAY the Amateur's Trophy for Teas, and Mr. B. R. CANT the Nurseryman's Champion Trophy for the best seventy-two blooms.

NURSERYMEN.

Seventy-two blooms, distinct varieties.—The Champion Trophy and 1st prize was won by Mr. B. R. CANT, of Colchester, with a capital collection. His varieties were Ulrich Brunner (very large), Cleopatra (very pretty bloom), Alfred Colomb, Marie Finger, Marquise de Litta, Madame Jules Finger, Gustave Piganeau, Caroline Testout, Heinrich Schultzeiss, La France, Duke of Edinburgh (large, good bloom, of much substance), White Lady, Comtesse de Ludre, Catherine Mermet, Dr. Andry, Mrs. John Laing, Horace Vermet, Madame Gabrielle Luizet, Thomas Mills (good), Mrs. Sharman Crawford, Marie Baumann, Lady Mary Fitzwilliam, Comte de Raimbaud, Mrs. W. J. Grant. Second row: Souvenir de la Malmaison, Magna Charta, Maréchal Niel, Madame Victor Verdier, Monsieur Noman, Madame Cusin, K. A. Victoria, Captain Hayward (capital), Mrs. Paul, Chas. Lefebvre, Hon. Edith Gifford, Sénateur Vaisse, Marchioness of Dufferin, Le Havre, Ernest Metz, Helen Keller, Innocente Pirola, Dupuy Jamain, Souvenir d'Elise Vardon, General Jacqueminot, Medea, Suzanne-Marie Rodocanachi, The Bride, and Crown

Prince. Third row : Salamander, Marchioness of Downshire, Auguste Rigotard (good), Souvenir d'un Ami, Marie Verdier, Golden Gate, Earl of Dufferin, Muriel Grahame, Abel Carrière, Bridesmaid, Annie Laxton, Maman Cochet, Ed. André, Madame de Watteville, Prince Arthur, Margaret Dickson (very fine), A. K. Williams, Madame Cadeau Camey, Madame Delville, Madame Bravy, Et. Levét, Merveille de Lyon, Dr. Sewell (good), and Souvenir de S. A. Prince. There were four other exhibitors, and of these Messrs. F. CANT & Co. were adjudged 2nd; Ulrich Brunner, Madame Victor Verdier, Dr. Andry, Captain Hayward, Madame Gabrielle Luizet, Marquise Litta, Marie Baumann, Margaret Dickson, Le Havre, J. D. Pawle, Mrs. Jno. Laing, and Countess Folkestone, were excellent blooms in this stand. Messrs. HARKNESS & SONS, Bedale, who won premier honours in this class in 1896 and 1897, were 3rd this season.

Forty distinct varieties (trebles).—Mr. B. R. CANT won again in this class, the varieties most contributing to this effect being La France, Mrs. John Laing, Marquise Litta, Souvenir de S. A. Prince, Madame Gabrielle Luizet, Prince Arthur, La Fraicheur, Suzanne-Marie Rodocanachi, Mrs. Sharman Crawford, Golden Gate, Mrs. W. J. Grant, Duke of Edinburgh, Marie Baumann, Caroline Testout, and Ulrich Brunner. Messrs. A. DICKSON & SONS, Newtownards, were 2nd, and their Roses, though smaller generally, were even and good specimens. It contained the new Rose, Mrs. Morrow, a bloom of distinct shade and pretty form, and Mrs. Bessie Brown, another new one. There were fine blooms of Mrs. Sharman Crawford, and of Mrs. E. Mawley, a new Rose of very peculiar tint. Messrs. F. CANT & Co. took 3rd prize, and won it from Mr. GEO. MOUNT, Messrs. G. PAUL & SON, and Messrs. HARKNESS & SON.

Forty-eight blooms, distinct varieties.—Messrs. D. PRIOR & SONS were the victors in this struggle, and the collection of flowers was a creditable one. The varieties in the exhibit were—Prince Arthur, Caroline Testout, Ulrich Brunner, Margaret Dickson (very fine), Marquise Litta, Marquis of Dufferin, Helen Keller, Mrs. Sharman Crawford, Gustave Piganeau, White Lady (good), Dupuy Jamain, Mrs. W. J. Grant, Chas. Darwin, Mrs. John Laing, Duke of Edinburgh, La France (good bloom). 2nd row: K. A. Victoria, Abel Carrière, The Bride, Etienne Levét, Madame Luizet, Comte Raimbaud, Souvenir de S. A. Prince, A. K. Williams (exceedingly bright), Magna Charta, Dr. Andry, Caroline Kuster, Prosper Laugier, Alba Rosea, Prince Camille de Rohan, and an extra class bloom of Marie Baumann. 3rd row: Fisher Holmes, Marie Verdier, Alfred Colomb, Souvenir d'un Ami, Duke of Fife, Margaret Dickson, Ed. Andry, Marchioness of Downshire, Beauty of Waltham, Souvenir d'Elise Vardon, Horace Vernet, Cleopatra, Duke of Wellington, Marie Van Houtte, E. Y. Teas, and Lady M. Fitzwilliam. Messrs. TOWNSEND & SON, Lower Broadmeath, Worcester, were 2nd with a collection that, judged at a glance, would probably have been placed 1st. Extra-sized specimens there were of Caroline Testout, Gustave Piganeau, Etienne Levét, Suzanne-M. Rodocanachi, Devoniensis, Madame de Watteville, Madame Gabrielle Luizet, Ulrich Brunner, Heinrich Schultze, Duke of Edinburgh, Fisher Holmes, and Jeannie Dickson. Messrs. BURRELL & Co., Cambridge, won 3rd prize from Mr. JOHN MATTOCK.

Twenty-four blooms, distinct varieties.—From six other competitors Mr. CHAS. TURNER, Royal Nurseries, Slough, won 1st prize in this class. His blooms were of capital quality, even in size, of satisfactory substance, fresh and bright in appearance, and an easy 1st. His flowers were Caroline Testout, Chas. Lefebvre, General Jacqueminot, Ulrich Brunner, Mrs. Sharman Crawford, Gustave Piganeau, Pride of Waltham, Beauty of Waltham, Etienne Levét, Dupuy Jamain, Madame Victor Verdier, Madame G. Luizet, Duke of Edinburgh, Chas. Lamb, Duke of Wellington, La France, Duchess of Bedford, Helen Keller, Prince Arthur, Marie Baumann, Duke of Teck, Mrs. J. Laing, R. A. Victoria, and Reynolds Hole. The 2nd prize collection happened to be in the next box, and was from Mr. G. PRINCE, Oxford, consequently the lovely Teas played a conspicuous part in the exhibit. Really excellent were Sylph, The Bride, Princess of Wales, Jean Ducher, Mme. Hoste, Muriel Grahame, Marchioness of Downshire, and Maréchal Niel; 3rd, Messrs. COOLING & SONS, Bath.

Twenty-four Trebles, distinct varieties.—Messrs. D. PRIOR & SONS, Colchester, won this class with very even, bright flowers, of much substance. Particularly good were Mrs. W. J. Grant, Marie Baumann, Magna Charta, Mme. Gabrielle Luizet, A. K. Williams, La France, Prince Camille de Rohan, Marquise Litta, Mrs. John Laing, and Duke of Edinburgh. The 2nd prize was taken by Mr. GEO. PRINCE, Oxford, and the Teas again were conspicuous; Madame Hoste, Souvenir de S. A. Prince, Princess of Wales, Captain Hayward, Golden Gate, Rubens, Comtesse de Nadaillac, and Bridesmaid were the best blooms. Mr. CHAS. TURNER was 3rd, and there were two other exhibitors in the class.

Twelve blooms distinct (Dickson Cup class).—1st, 2nd, and 3rd prizes were offered by Messrs. A. DICKSON & SONS for the best dozen varieties (single blooms) sent out by this firm from the Newtownards nurseries. In this class, singularly enough, the 1st prize was won by the donors of the prize, there being four other collections. The varieties were Mrs. Sharman Crawford, Helen Keller, Mrs. W. J. Grant, Tom Wood, Robert Duncan, Jeannie Dickson, Countess of Caledon, Marchioness of Dufferin, Killarney, Ards Rover, Muriel Grahame, and Daisy. Messrs. F. CANT & Co. were 2nd, and showed, among others, Mrs. W. J. Grant, Margaret Dickson, Lady Helen Stewart, and Mrs. Jas. Wilson. Mr. B. R. CANT took 3rd prize.

Twelve distinct varieties, seven trusses of each.—These blooms were to be staged in twelve vases or receptacles other than boxes. Mr. J. MATTOCK, of Oxford, showed well. Some of the varieties, especially the Teas, had to be wired; others were perfectly erect without such support. The effect was decidedly pretty, but the exhibitor should have plainly labelled the varieties. Messrs. PAUL & SON, Cheshunt, were 2nd, and Mr. GEO. PRINCE, of Oxford, 3rd.

TEAS AND NOISETTES.

Twenty-four blooms, distinct varieties.—Teas and Noisettes generally, were of considerable size and substance. Some of them by reason of the occasional rains and winds, lacked refinement. There were four exhibits in this class, and the 1st prize went to Mr. GEO. PRINCE, Oxford. His varieties were Comtesse de Nadaillac (Medal bloom), Souvenir de S. A. Prince, Madame de Watteville (a very pretty bloom), Innocente Pirola, Maréchal Niel, Rubens, Mrs. Pierrepont Morgan, a new Rose in the way of Madame Cusin, but lighter. Cleopatra, Anna Olivier, Ernest Metz, Francisca Kruger, The Pride, Maman Cochet, Marie Van Houtte, Princess of Wales, Hon. Edith Gifford, Amazone, Madame Hoste, Catherine Mermet, Monsieur "Furtado," Souvenir d'un Ami, Muriel Grahame, Princess Beatrice, Golden Gate (very good). 2nd, Messrs. PRIOR & SON, Colchester, who also showed very well, and Ernest Metz, Maman Cochet, Cleopatra, Souvenir de S. A. Prince, and Catherine Mermet, may be specially mentioned as fine blooms. Mr. B. R. CANT beat Messrs. CANT & Co. for 3rd place.

Twelve blooms, distinct varieties.—Mr. J. MATTOCK led in this class, and showed some good blooms, but there were no names attached to them. Messrs. BURRELL & Co., Cambridge, who were 2nd, showed fairly well; and Messrs. TOWNSEND & SONS, Worcester, beat the other exhibitors for 3rd place.

Eighteen distinct varieties (trebles).—This class made a really beautiful display, and the 1st prize was secured by Mr. G. PRINCE, Oxford. He had Comtesse de Nadaillac (very fine), Souvenir de S. A. Prince, Souvenir d'un Ami, The Bride, Innocente Pirola, Luciole, Souvenir d'Elise Vardon, Catherine Mermet, Cleopatra, Madame Cusin, Princess of Wales, Rubens (capital), Maréchal Niel, Ernest Metz (very good), Medea, Bridesmaid (a beautiful colour), Marie Van Houtte, and Devoniensis. Messrs. PRIOR & SON, Colchester also showed very finely, their exhibit being composed of very pretty even blooms. Messrs. F. CANT & Co. beat Mr. J. MATTOCK for 3rd place.

GARDEN OR DECORATIVE ROSES.

The date of the metropolitan show was exactly suitable to the pretty Roses of this section.

Twenty-six distinct varieties, not fewer than three trusses of each.—Messrs. PAUL & SON, Cheshunt, were 1st in this class, which, as usual, made a gorgeous display of colour, and the sprays were made up with fine taste and finish. Some of the best varieties were Amy Robart, a large, single, rose-coloured variety; Dawn, an extra large, warm-coloured, new Rose, exhibited at the Palace last year; Camoens, a very pretty Rose when about half open; Marquis of Salisbury, deep crimson, semi-double Rose; Alba, a large single, pure white flower; Janet's Pride, one of the prettiest of the Sweet Briars; Crimson Rambler, Morlett, Paquerette, a white button-hole Rose; L'Idéal, a very distinct bronzy-red Rose; Royal Scarlet, a new single Rose, of exceeding bright scarlet; Rugosa fimbriata; Una, a new large, single, cream-flowered hybrid; Polyantha Perle d'Or, and several Moss Roses. Messrs. J. COOLING & SON, Bath, who always exhibit these charming garden Roses finely, were 2nd, with a beautiful lot, in which the varieties were slightly different, but not greatly less showy.

Eighteen distinct varieties, not fewer than three trusses of each, were best from Mr. J. MATTOCK, and in his selection of varieties secured a fair representation of the various sections. The best were Janet's Pride, Ma Capucine, W. A. Richardson, Madame Falcot, &c. Mr. C. TURNER was capital as 2nd prize exhibitor, making a specialty of the Moss Roses.

Twelve distinct varieties of single-flowered Roses in trusses of not fewer than three blooms.—Messrs. G. COOLING & SON, Bath, won this class, and the exhibit was exceedingly attractive. The varieties were Rugosa alba, Yellow Austrian Briar, humilus x rugosa, Andersoni, macrantha, Paul's Single White, Himalaica, pisocarpa, Lucy Ashton, Cooling's Single Crimson Bedder, and villosa nivea. Messrs. PAUL & SONS, Cheshunt, showed well for 2nd prize.

Button-hole Roses.—The best exhibit of nine distinct varieties of Roses suitable for button-holes, to be shown in vases, was from Mr. GEO. PRINCE. These were very pretty indeed, and scarcely less so was a collection from Mr. J. MATTOCK.

Sprays of Roses.—These were made tastefully, and were suitable for ladies' wear. Mr. O. G. ORPEN, Colchester, won 1st prize, and Mr. GEO. PRINCE was 2nd.

OPEN CLASSES.

Twelve blooms of Hybrid Teas distinct.—Mr. B. R. CANT won 1st honours in the class, staging the following varieties, La France, White Lady, Mrs. W. J. Grant (a very bright handsome bloom of this distinct variety), K. A. Victoria, Lady M. Fitzwilliam, Duchess of Albany, Antoine Rivoire, Catherine Testout, Souvenir de President Carnot, La Fraicheur, Clara Watson, and Marquise Litta, the colour of which was exceedingly bright. Messrs. J. PRIOR & SON, who were 2nd, had very fine blooms of La Fraicheur, Countess of Caledon, and Mrs. W. J. Grant. Messrs. F. CANT & Co. took 3rd prize.

Twelve blooms of any Yellow Rose.—Maria van Houtte, shown by Messrs. PRIOR & SON, Colchester, was awarded 1st prize in this class, and the quality of these blooms was very good. Mr. G. PRINCE was 2nd, with excellent Maréchal Niel; and Messrs. A. DICKSON & SONS, Newtownards, 3rd, with Marie van Houtte. There were seven competitors.

Twelve blooms of any white Rose.—The 1st prize in this class went to Mr. G. PRINCE, Oxford, for an exhibit of Souvenir de S. A. Prince, the blooms being of good size, but disfigured slightly by rain. Mr. B. R. CANT, of Colchester, followed with pretty blooms of Margaret Dickson; and The Bride, shown by A. H. GRAY, Esq., Beaulieu, Bath, was 3rd. There were twelve exhibitors.

Twelve blooms of any light or dark crimson Rose.—Mr. C. TURNER, Slough, was a fine 1st here, with a dozen highly-coloured substantial blooms of Ulrich Brunner. There were ten competitors. Messrs. TOWNSEND & SONS were 2nd with good Gustave Piganeau; and Messrs. HARKNESS & SONS were 3rd with Horace Vernet.

Twelve blooms of any light pink or rose-coloured Rose.—Mr. B. R. CANT won with twelve blooms of Mrs. W. J. Grant, exhibiting splendid colour, and some of them of capital quality. The same variety secured 2nd prize for Messrs. ALEXANDER DICKSON & SON; and Mr. C. TURNER, with a collection of blooms of the variety Mrs. John Laing, was 3rd. There were ten other collections.

Twelve blooms of any Tea or Noisette.—Mr. G. PRINCE showed marvellously well-coloured blooms of Comtesse de Nadaillac, not lacking in size. Rubens, shown by Messrs. TOWNSEND & SONS, were 2nd (rather small); and Messrs. PRIOR & SON, who showed the same variety, were 3rd. There were ten competitors.

NEW ROSES.

Mr. B. R. CANT won with Mrs. W. J. Grant, being the best dozen of this variety in the show; Messrs. A. DICKSON & SONS followed, with Ulster; and Rev. Alan Cheales, from Messrs. PAUL & SONS, Cheshunt, was 3rd.

Twelve blooms of new Roses, distinct varieties.—Mr. B. R. CANT was again 1st, choosing for exhibition the following varieties:—Mavourneen, Beauté Lyonnaise, Mrs. W. J. Grant, Mrs. Rumsey, Helen Keller, Souvenir de President Carnot, Empress Alexandra (poor bloom), Madame Cadeau Ramey, Tom Wood, Antoine Rivoire, Marguerite Appert, and Souvenir de Jeanne Cabaud; Messrs. A. DICKSON & SONS were 2nd, and included a capital bloom of Mrs. Mawley, which in this case was peculiarly pretty in tint, also one of Mrs. W. J. Grant; Messrs. PAUL & SON, Cheshunt, were 3rd.

Three trusses of any new seedling Rose or distinct sport.—Messrs. COOLING & SONS, Bath, were fortunate enough to secure the National Rose Society's Gold Medal for a new white hybrid Tea Rose named Purity, which gained a card of commendation at the Portsmouth show last year. At first glance it would appear pure white, but looking into the bud there is a very faint blush. Messrs. PAUL & SONS showed their hybrid Rose Una in this class. It is a large single-flowered variety, with pale cream or white flowers. Mr. GEO. PRINCE, of Oxford, exhibited in this class a sport from L'Idéal, of distinct shade of colour, and named Jubilation.

MEDAL ROSES.

The best bloom of a Tea or Noisette was of the same variety in the amateur's as in the nurserymen's section. This was Comtesse de Nadaillac, in the amateur's class, shown by A. HILL GRAY, Esq.; and in the nurserymen's by that excellent cultivator of Tea and Noisette Roses, Mr. GEO. PRINCE. The best bloom of a H.T. was a good one of White Lady, in the amateur's section, from Mr. C. J. GRAHAME; and of Mrs. W. J. Grant, in the nurserymen's classes, from Mr. B. CANT. Mr. E. B. LINDSELL had the medal for the best H.P., for a bloom of Mrs. Jno. Laing; and a large bloom of Gustave Piganeau, shown by Messrs. W. J. TOWNSEND & SON, was the best bloom in the nurserymen's classes.

AMATEURS.

The competition in this section was well contested generally, many of the blooms showing great excellence, though in some classes it must be admitted that the season has somewhat militated against the full development and perfection of the flowers.

In the class for thirty-six blooms, distinct varieties, open to all Amateurs, some six competitors entered the lists, the premier award falling to E. B. LINDSELL, Esq., Bearton, Hitchin, in whose stand were good blooms of Ulrich Brunner, S.-M. Rodocanachi, Beauty of Waltham, Gustave Piganeau, Captain Hayward, Mrs. Grant (in excellent condition), Charles Turner, Madame Cusin, Comte Raimbaud, Duke of Wellington, Xavier Olibo, Ernest Metz, and Dupuy Jamain. The 2nd prize fell to the Rev. J. H. PEMBERTON, whose stand was but slightly inferior, good blooms being shown of Marie Baumann, full, and of fine form; La France, Helen Keller, beautiful in form and bright in colour; Mrs. Sharman Crawford, a fine, bold, rosy pink; Prince Arthur, Gustave Piganeau, Charles Lefebvre, large, and of good colour; General Jacqueminot, and Mrs. John Laing. The 3rd was awarded to S. P. BUDD, Esq., Gay Street, Bath, who had some excellent blooms, and several that were altogether deficient in good quality. Among his best were Alfred Colomb, Dupuy Jamain, A. K. Williams (superb in colour and fine in form), Marie Baumann, and Captain Christy.

In the Class for twenty-four blooms distinct, open only to those who have not won the Champion Challenge Trophy within the last ten years, the competition was keen, and good blooms were apparent in most of the stands; the 1st prize was won

by F. W. FLIGHT, whose blooms were of good quality, throughout, even and showy. Among the most prominent were White Lady, Ulrich Brunner (rich and full), Margaret Dickson, Charles Salter, Jeannie Dickson (large and clear), Etienne Levet, La France, Captain Hayward, Mrs. J. Laing, Duke of Wellington, Lady Mary Fitzwilliam, Helen Keller, and A. K. Williams; the 2nd was taken by R. E. WEST, Esq., Reigate, with a very good stand, the blooms being regular in size and very fresh; Captain Hayward, Mrs. Sharman Crawford, Charles Lamb, Etienne Levet, Dupuy Jamain, La France, Charles Lefebvre, A. K. Williams (of a most vivid colour), Comte Raimbaud, and Madame Victor Verdier being amongst the most noticeable ones. A. TATE, Esq., Leatherhead (gr., Mr. W. Mease), came in 3rd, with a very meritorious lot, good blooms being shown of Mrs. W. J. Grant (a bright rosy-pink), Count Raimbaud, Gustave Piganeau, Souvenir d'un Ami, Maurice Bernardin, Madame Gabrielle Luizet, and Souvenir d'Elise Vardon (very fine and full).

In the class for twelve distinct varieties, three blooms of each, E. B. LINDSELL, Esq., was awarded 1st prize, his stand containing very attractive and good flowers, the best being Gustave Piganeau, Beauty of Waltham, Captain Hayward, A. K. Williams, Helen Keller, and S.-M. Rodocanachi. The 2nd was taken by T. B. HAYWARD, Esq., Woodhatch Lodge, Reigate (gr., Mr. T. J. Salter), whose blooms, though somewhat smaller, were fresh and bright; here were remarked Violet Bouyer (a lovely flower), M. E. Y. Teas, Madame Gabrielle Luizet, Madame Hoste (good in colour and form), Charles Lefebvre and Exposition de Brie; the 3rd was awarded to Col. J. H. PITT, Turkey Court, Maidstone, whose blooms of General Jacqueminot, Caroline Testout, and Margaret Jackson were among the best.

In the class for twelve blooms of any Rose except Teas or Noisettes, C. J. GRAHAM, Esq., Wrydland, Leatherhead, was 1st, showing White Lady, a very choice flower of good form and substance; a shade of pale blush, however, was very noticeable in all the flowers. 2nd, E. B. LINDSELL, Esq., with Horace Vernet, whose blooms were large and bright; and S. P. BUDD was 3rd, with Caroline Testout, very large and full.

In the class for eighteen blooms distinct, open to growers of less than 2000 plants.—Eleven stands were put up, and some very good blooms were shown, the premier position was taken by CONWAY JONES, Esq., Hucclecote, Gloucester, whose blooms of Gustave Piganeau, Mrs. W. J. Paul, Tom Wood, Horace Vernet, and Jeannie Dickson were of first-class quality. E. M. BATHURST, Esq., Devine Park, Horsham, was 2nd with a good stand containing fine Camille Bernardin, Duchess of Bedford, Marie Baumann, and Duke of Edinburgh; 3rd, R. E. WEST, Esq., Reigate, whose Xavier Olibo, Duke of Edinburgh, Dupuy Jamain, and Captain Hayward, were the more noticeable blooms.

For three blooms each of eight distinct varieties.—R. E. WEST, Esq., was 1st with Earl Dufferin, Mrs. Sharman Crawford, General Jackson, and Captain, among his best. The 2nd fell to P. G. C. BURNARD, Esq., Reigate, who had a very clean and neat lot. The 3rd going to W. C. ROMAIN, Esq., Windsor.

Five stands were put up for nine blooms of any Rose, except Teas or Noisettes.—Here, E. M. BETHUNE, Denne Park, Horsham (gr., Mr. H. Harris), came well to the fore, showing good blooms of Kaiserin Augusta Victoria; the Rev. HUGH BERNERS, Harkstead Rectory, Ipswich (gr., Mr. Cook), coming 2nd with nice blooms of Margaret Dickson; 3rd being taken by P. G. C. BURNARD, Esq., with Duke of Wellington.

In the class for twelve blooms distinct, open only to growers of fewer than 1000 plants, of the varieties found in the National Rose Society's "Catalogue of Exhibition Roses," including Teas and Noisettes.—There were nine competitive stands. The 1st prize fell to G. MOULES, Esq., Hitchin, Herts, whose collection was very bright and attractive, and good blooms generally, the more prominent ones being Prince Arthur, Duke of Wellington, Caroline Testout, very fine; A. K. Williams, Horace Vernet, Maman Cochet, and Captain Hayward; R. F. HOBBS, Worcester, who came 2nd, showed Heinrich Schultheiss, Charles Lefebvre, Jean Ducher, and La France.

In the class for nine blooms, distinct, open only to growers of fewer than 50 plants, J. C. TRUMAN, Oaklands, Swanley, was awarded the Challenge Cup and 1st place in competition with eight others. Among his best were Charles Lefebvre, Madame Gabrielle Luizet and Maurice Bernardin; 2nd, H. FOSTER, North Street, Ashford, with large blooms, some of them rather over blown. His best were Duke of Edinburgh, Gustave Piganeau, and Annie Olivier. R. W. BOWYER, Esq., Hailbury, was 3rd.

For a stand of six blooms, distinct.—1st, G. A. HAMMOND, Esq., his La France, Dupuy Jamain, S.-M. Rodocanachi, Earl of Dufferin, Margaret Dickson (good), and Victor Hugo being all excellent. 2nd, R. COOK, Esq., Woodthorpe, Stonebridge Park, who had capital and fresh flowers of Margaret Dickson, Kaiserin Augusta Victoria, Gustave Piganeau, Caroline Testout, Mrs. R. Sharman Crawford, and Viscountess Folkestone. W. D. FRESHFIELD, Esq., Reigate, came in 3rd, with a very good lot. There were six competitors.

Twelve blooms, distinct.—In this class, the 1st prize and the Ramsay Cup fell to G. MOULES, Esq., Hitchin. This was a very good class, and good blooms ruled in the winning stands. In the premier stand there were fine flowers of Hon. Edith Gifford, Madame Hoste, Anne Olivier, A. K. Williams, Fisher Holmes, Rubens and Exposition de Brie; 2nd, L. PARRY, Esq., Stamford House, Dorchester, who had Maréchal Niel, Catherine Mermet, Ulrich Brunner, among his most prominent blooms; 3rd fell to E. WILKINS, Esq., Rosedale, Sidcup,

whose stand was very good, having in good form Captain Hayward, Duchess of Bedford, and Dr. Andry. Ten competed.

For triplets, four distinct varieties, eight competed. This was an interesting class, and the 1st prize fell to E. WILKINS, Esq., who had good blooms of Dupuy Jamain, La France, Madame Gabrielle Luizet, and Kaiserin Augusta Victoria; 2nd, M. HODGSON, Esq., Shirley Cottage, Croydon, who showed Dupuy Jamain, Mrs. J. Laing, Gustave Piganeau, and La France. J. H. SCOTT-TUCKER, Headington Vicarage, Oxford, was 3rd, with Anne Olivier, Gustave Piganeau, La France, and Duke of Wellington.

G. W. COOK, Esq., The Briar, Finchley, was 1st for six blooms of any Rose except Teas and Noisettes, showing very fine blooms of Mrs. W. J. Grant. 2nd, L. PARRY, Esq., Dorchester, for good flowers of White Lady; and the 3rd, E. WILKINS, Esq., for Gabrielle Luizet in very fine form.

For twelve blooms, distinct, open to all Amateurs, there were seven contestants, the 1st place being taken by O. G. ORPEN, Esq., Colchester. Good blooms were present in all these stands, and especially noticeable in the premier stand were blooms of Margaret Dickson, A. K. Williams, Lady Mary Fitzwilliam, Kaiserin Augusta Victoria, Souvenir d'Elise Vardon, Catherine Mermet, and Marquis Litta; 2nd, Rev. J. H. PEMBERTON, who had in good form La France, A. K. Williams, Mrs. Sharman Crawford, and Caroline Testout; 3rd, P. G. C. BURNARD, with a good boxful.

Nine distinct, to include not more than four varieties of Teas or Noisettes, seven trusses of each, space occupied by an exhibit not to exceed 5 feet by 4 feet, and the blooms to be set up in vases.—The Rev. J. H. PEMBERTON was the only competitor, who was awarded 1st prize. His blooms consisted of La France, A. K. Williams, Comtesse de Nadaillac, Caroline Testout, Mrs. J. W. Grant, Ulrich Brunner, and Souvenir d'un Ami.

Thirteen stands were put up in the class for six blooms, distinct, open only to amateurs who have never won a prize at an exhibition of the National Rose Society.—J. CARTER, Esq., Mill House, Halstead, came well to the fore, having very nice Niphetos, Ulrich Brunner, Mrs. J. Laing, and Duke of Edinburgh. G. V. A. SCHOFIELD, Esq., was 2nd; and J. HUNT, Esq., 3rd.

For six blooms not less than four varieties.—J. HENTON, Esq., Batheaston, was well to the front, having good examples of Duke of Wellington, Horace Vernet, Cleopatra, and Kaiserin Augusta Victoria. J. HUNT, Esq., was 2nd, with Margaret Dickson and Madame Bruneau among his best flowers. The 3rd was taken by F. VALENTINE, Esq., Castle Rising, King's Lynn, showing Hon. Edith Gifford, Annie Dickson, Grace Darling, and Viscountess Folkestone.

For six blooms, confined to amateurs who have joined the N.R.S. since the last Crystal Palace Rose Show.—Five stands were put up in this class. G. MOORE, Esq., Lyminster, Arundel, was 1st, showing blooms of Madame Lambard, Hon. Edith Gifford, Captain Hayward, and Magna Charta among his best; 2nd, B. J. MARCH, Claygate, Surrey.

For six blooms, distinct, grown within 8 miles of Charing Cross.—G. W. COOK, Esq., came well to the fore, his blooms being clear, full, and fresh, the best being Caroline Testout, Captain Hayward, Mrs. S. Crawford, Charles Lefebvre, Gustave Piganeau, and Madame Chauvry; 2nd, A. C. GIFFORD, Esq., Tennyson Road, South Norwood, who had a splendid bloom of Mrs. Sharman Crawford, Jeannie Dickson, Captain Christy, Lady A. Hill as his best; J. BATEMAN, Esq., Rose Vale, Archway Road, Holloway, was 3rd. There were six competitors here.

In the class for six blooms of new Roses, distinct, five stands were observed. 1st, CONWAY JONES, Esq., Gloucester, whose blooms were very good, and consisted of Tom Wood, Sylph, Princess de Venosa, Helen Keller, Marjorie, and Mrs. J. Grant. O. G. ORPEN, Esq., Colchester, was 2nd, with good flowers of Enchantress, Francis Debreil, White Maréchal Niel, Mavournen, Mrs. W. J. Grant, and Helen Keller. J. H. PEMBERTON was 3rd, who had good blooms of Souvenir de President Carnot, Merrie England, and Antoine Rivoire as his best.

In the Tea and Noisette sections some very good stands were staged. For eighteen blooms distinct, A. H. GRAY, Esq., Bath, was the winner of 1st prize, beating four other competitors. Here we noticed specially good blooms of Jules Finger, Alba rosea, Maman Cochet, Ernest Metz, Princess Beatrice, Souvenir d'Elise Vardon, Souvenir d'un Ami, Bridesmaid, Comtesse de Puisse, Peter Gifford, Souvenir de S. A. Prince, Medea, Catherine Mermet, Cleopatra, Marie Van Houtte, Comtesse de Nadaillac (very fine, awarded the Silver Medal as the best Tea in the amateur section), The Bride, and Maréchal Niel. CONWAY JONES, Esq., was a close 2nd, who had splendid flowers amongst others of Catherine Mermet, Maréchal Niel, Cleopatra, Madame Cusin, Bridesmaid, Princess of Wales, Innocente Pirola, Madame Hoste, Maman Cochet, and Comtesse de Nadaillac; the 3rd was taken by O. G. ORPEN, Esq., whose blooms, though somewhat smaller, were fresh and clean. Among his most worthy were Anna Olivier, Francisca Kruger, Catherine Mermet, and Jean Ducher.

For twelve distinct Teas and Noisettes open to all amateurs irrespective of the number of plants they grow.—Seven stands were put up: this was a good class, and the stands were very close, the 1st being awarded to A. H. GRAY, Esq., whose blooms of Alba rosea, Catherine Mermet, The Bride, Maman Cochet, Souvenir d'un Ami, and Maréchal Niel, were very prominent. A. TATE Esq., Leatherhead, was a good 2nd, having fine blooms of Maman Cochet, Souvenir de S. A. Prince, Comtesse de Nadaillac, Souvenir d'un Ami, Caroline

Kuster, and Souvenir d'Elise Vardon; the 3rd fell to A. M. BETHUNE, Esq.

For eight distinct Tea and Noisettes, three blooms of each.—A. H. GRAY was again 1st, with very fresh and full blooms of The Bride, Princess of Wales, Madame Hoste, Catherine Mermet, Comtesse de Nadaillac, Maréchal Niel, Ernest Metz, and Souvenir de S. A. Prince; S. P. BUDD, Bath, was 2nd; and Col. J. H. PITT, Maidstone, 3rd; this class was a very attractive one.

For nine blooms of any one variety, Tea and Noisettes.—A. H. GRAY was 1st, with very fine blooms, clean, full, and fresh, of Catherine Mermet; S. P. BUDD, 2nd, with Madame Hoste in splendid condition; E. M. BETHUNE 3rd, with Comtesse de Nadaillac in fine form also.

In the class open only to growers of less than 500 plants of Teas and Noisettes, for twelve blooms distinct.—CONWAY JONES, Esq., was 1st with a good stand, in which were splendid blooms of Souvenir de S. A. Prince, Comtesse de Nadaillac, The Bride, Cleopatra, Madame Cusin, Bridesmaid, and Innocente Pirola; the 2nd was taken by R. F. HOBBS, Worcester, amongst these Roses being wonderfully fine blooms of Maréchal Niel, and good ones of Anna Olivier, Niphetos, and Madame de Watteville; A. EVANS, Esq., Marston, Oxford, was 3rd, with a good stand.

For nine blooms, distinct.—Six stands were put up, the 1st prize going to J. T. STRANGE, Esq., Aldermaston, whose best were Madame Lambard, Marie Van Houtte, The Bride, and Maman Cochet; E. MAWLEY, Esq., Berkhamsted, was 2nd; and Miss PAKER, Reigate, 3rd.

A capital lot entered in the class for nine distinct blooms, open only to growers, of less than 20 plants of Teas and Noisettes.—Here MAMMON WHITE, Esq., Belgrave Avenue, Leicester, was 1st, beating nine other exhibitors; his blooms of Caroline Kuster, Hon. Edith Gifford, and Princess of Wales were especially good. Close up was A. MUNT, Esq., Slough, 2nd, with good flowers of Maman Cochet and Muriel Grahame; the third was taken by W. D. FRESHFIELD, Esq., Reigate, with good forms and very fresh blooms.

For six blooms in the same section.—Six stands were put up, the Rev. G. E. JEANS, Isle of Wight, being 1st; G. E. TRULMAN, Esq., close up, 2nd, with very choice blooms; and R. W. BOWYER, Esq., 3rd.

In the class for four distinct varieties, Teas and Noisettes, three blooms of each, nine stands were shown, and were noticeable all through for freshness; the 1st fell to CONWAY JONES; and 2nd, to R. E. WEST, Esq., Reigate.

For six blooms of any one variety.—CONWAY JONES was awarded 1st with a capital lot of Maréchal Niel; L. PARRY, Esq., 2nd, with Hon. Edith Gifford.

For six distinct varieties, seven trusses of each.—O. G. ORPEN, Esq., came in 1st, with fine blooms of Anna Olivier, Madame Van Houtte, and Souvenir d'un Ami; 2nd, A. EVANS, Esq., Oxford.

For six blooms in not less than three varieties, Teas and Noisettes, open only to amateurs who have never won a prize at an exhibition of the National Rose Society.—Some eight lots were put up, the 1st prize being awarded to J. HINTON, Esq., Bath-easton, who had in fine condition Souvenir d'un Ami, Medea, Souvenir de S. A. Prince, Princess of Wales, Comtesse de Nadaillac, and Catherine Mermet; and J. CARTER, Mill House, Halstead, was 2nd.

In the section for garden or decorative Roses, for twelve distinct varieties, not less than three trusses of each, space occupied not to exceed 5 feet by 3 feet, all hybrid perpetuals, except single-flowered varieties to be excluded, and all Teas and Noisettes and hybrid Teas mentioned in the National Rose Society's Catalogue of Exhibition Roses also excluded; Moss, Provence, and other summer-flowering Roses may be included.—In this class A. TATE, Esq., Downside, Leatherhead, was 1st, showing fine clusters in bottles on a stage covered with black velvet, the bottles so dropped through holes as to be entirely hidden; here were fine clusters of W. A. Richardson, Rosa Mundi, Coupe d'Hébé, Safrano, Perle d'Or, Marquis of Salisbury, Gustave Regis, Red Damask, Bardon Job, and others—a very interesting exhibit. The 2nd prize fell to the Rev. J. H. PEMBERTON, who had a very fine collection, staged in glass vases. Six collections were shown in this class.

For nine distinct varieties, not less than three trusses of each, space occupied not to exceed 1 foot by 3 feet.—Mrs. A. F. PERKINS, Oak Dene, Holmwood, Dorking, was 1st, having good clusters, among which we observed L'Amicus, Madame Plantier, W. A. Richardson, and Paul's Crimson Pillar. Miss DOUGHY A. NESFIELD, Shadwell, Speldhurst, was 2nd, with a very good lot. O. G. ORPEN was 1st for twelve vases of Lord Ponza's Sweet Briars in not fewer than six varieties and not more than seven trusses in a vase, a very interesting display. F. W. CAMPION, Reigate, was 2nd with a nice collection also.

In the Decorative Section open only to Lady Amateurs who are either Subscribers to the National Rose Society, or are members of the family of any Amateur Subscriber, for a vase of cut Roses lightly arranged with any cut foliage, Ferns or grasses, the vase to be an upright ornament, having only one receptacle for flowers.—Miss O. G. ORPEN was 1st with a very beautiful vase of Anna Olivier lightly placed and arranged, with Adiantum cuneatum, and grasses; and Mrs. E. MAWLEY was 2nd.

MISCELLANEOUS EXHIBITS.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, amongst a collection of hardy bulbous flowers, had many varieties of Lillium Thunbergianum, including the deeply-coloured L. T. Van Houtte, and the distinctly pretty Prince

of Orange; *L. Washingtonianum purpureum*, a spotted variety of this species; the handsome *L. auratum* Wittel; with rich yellow vein through centre of each segment; *L. Browni*, *L. Hansonii*, were noticed. Also *Brodieae*, *Irises* *Calochortus* of the *Venus* strain, and *L. rubellum*.

A grand show of *Cannas* (Indian Shot), in pots, was made by Messrs. H. CANNELL & SONS, Swanley, Kent, in a style of group now becoming familiar at the summer exhibitions. Some of the varieties that showed to greatest advantage were *Madame Crozy*, *Emile Thomas*, *Milne Redhead*, *Souvenir d'Antoine Crozy*, and *Aurore*. Altogether there were some forty varieties.

MESSRS. GEO. JACKMAN & SON, Woking, Surrey, had miscellaneous hardy flowers and cut Roses; some of the latter were of admirable quality, as *Captain Christy*, *Earl of Pembroke*, *Ulrich Brunner*, *Jean Cherpin*, *Duchess de Morny*, and others. The new *Campanula mirabilis* was again shown. Mr. W. SPOONER, Arthur Bridge Nursery, Woking, staged a number of good Rose blooms in boxes.

MESSRS. DOBBIE & CO., Rothesay, N.B., and Orpington, Kent, had a fine display of *Violas* in sprays, and of Sweet Peas in bunches. Some of the best and newest of the Sweet Peas were *Chancellor*, pink; *Colonist*, rose-coloured; *Duchess of Sutherland*, white with slight blush; *Lady Mary Currie*, a very bright flower; and *Lady Nina Balfour*, pale lilac.

MESSRS. LAXTON, nurserymen, Ledford, staged baskets of Strawberries of the varieties *Royal Sovereign*, *Leader*, *Monarch*, and *Mentmore*. The last named is a new one, and deeper coloured than most of the others.

Mr. J. WILLIAMS, Ealing, showed silvered devices, &c., for holding flowers for the decoration of the dinner-table; and Mr. JAS. PINCHES, Crown Street, Camberwell, had a stand exhibiting various useful forms of garden labels.

MESSRS. BARR & SONS, King Street, Covent Garden, had a collection of hardy flowers, the *Peonies* especially being very fine. *Papavers* and *Delphiniums* were also conspicuous.

MESSRS. J. CHEAL & SONS, Lowfield Nurseries, Crawley, had also a collection of hardy flowers.

MESSRS. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., arranged a very pretty group of plants in a corner near to the orchestra. The feature of the group was the double-flowered *Begonias*, which were very fine, and they were tastefully amid fine foliage plants. Messrs. Laing had also a large collection of hardy flowers in bunches, and besides these a table furnished with florists' arrangements.

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nurseries, were represented by a group of *Roses* in pots, backed by large well-flowered plants of *Hydrangea paniculata*.

Mr. FOSTER, Brockhampton Nurseries, had a display of Sweet Peas in bunches of numerous varieties, *Duchess of Edinburgh*, *Sensation*, *Mrs. Eckford*, and *Alice Eckford*, were among the best and the newest of those displayed.

MESSRS. CUTBUSH & SON, Highgate Nurseries, London, N., had a grand lot of *Malmaison* *Carnations*. Also some new perpetual-flowering varieties, *Edith Sydenham*, an excellent white one of good size and non-splitting calyx; and *Noble*, a salmon-pink-coloured variety, is equally good in this respect.

LEE, BLACKBEATH, LEWISHAM, AND WEST KENT HORTICULTURAL.

JULY 6.—The annual exhibition of this long-established society was held in the grounds of The Cedars, Lee, on the above date.

The Lee Society apparently suffers, as many others have done, from the fact that horticultural societies whose chief work is to hold exhibitions have become more and more numerous. Though such a circumstance may be regarded with satisfaction as a sign of horticultural activity, the numerous societies have the effect of weakening each other. The event of Wednesday was a pretty little show, but unequal in extent and quality to many previously held under the same auspices.

Several exhibitors competed for the prizes for a collection of six stove or greenhouse plants, and the 1st prize was won by Mr. C. Birch, gr. to R. Whyte, Esq., Pentland House, Old Road, Lee; Mr. F. Fox, gr. to Mrs. Penn, The Cedars, Lee, being 2nd. Mr. NUNN won for a collection of twelve stove and greenhouse plants. The specimens in this exhibit were of only moderate merit, most interesting being that of *Hoya carnosa*.

The prizes offered by the tradesmen of Blackheath for a collection of six plants in 9-inch pots brought several exhibits, but there was little of interest in them. The best, however, was from Mr. W. Payne, gr. to C. D. Abel, Esq., 11, Eastcombe Villas, Blackheath.

The best collection of six *Cordylines* was from Mr. J. Lambert, gr. to H. W. Segelcke, Esq., Herne Hill. These moderate-sized, well-grown plants were of the following varieties:—*Lord Wolseley*, *Gladstone*, *Goldiana*, *Anerleyensis*, *Madame Bergman*, and *Lindenii*.

Caladiums were shown as capital specimens. The 1st prize for six plants was taken by Mr. C. NUNN, and the 2nd prize by Mr. W. PAYNE.

There were several collections of six exotic Ferns, and the best was one from Mr. C. BIRCH. Mr. J. LAMBERT won for a group of four Ferns.

Of several groups of plants arranged for effect in a space not exceeding 40 superficial feet, Mr. F. Fox had a pretty exhibit, and much the brightest shown. The plants were slightly crowded, however, a common mistake. Several pots of pretty *Schizanthus pinnatus* were in this group.

The best specimen plant in flower was a capital example of *Lilium* from Mr. C. BIRCH, and the Silver Medal for the best

instance of successful cultivation was given as an additional prize. Mr. T. Aley, gr. to R. KERSY, Esq., High Road, Lee, showed good *Coleus*; and also took 1st prize for three table plants, and for a specimen table plant.

Roses.—The class for forty-eight *Roses* distinct (Nurserymen), was won by Messrs. G. & W. H. BURCH, Peterborough, who were also the best exhibitors in the class for twenty-four blooms. The blooms were of very commendable quality, especially in the latter class. Mr. JNO. R. FOX, Croydon, took 2nd prize in each of the classes.

In the Amateur's *Rose* Classes almost all of the 1st prizes were won by Mr. G. W. COOK, the Briars, North Finchley; but for twelve *Teas* or *Noisettes*, the honour went to Mr. J. BROWNING, 9, Belgrave Place, Fools Cray.

Fruit.—Mr. E. Longley, gr. to Mrs. Holt, Waratah, Chislehurst, had good *Pitmaston* *Orange* *Nectarines*, and *Royal George* *Peaches*, and was also 1st for a collection of four dishes of fruit.

The best collection of six dishes of fruit came from Mr. E. Dove, gr. to H. E. Fry, Esq., Bickley Hall, whose *Strawberries* and *Pineapple* were commendable.

Mr. E. Dove won several 1st prizes for collections of vegetables, and Mr. J. Amey, gr. to F. E. Siebreich, Esq., Chislehurst, for salads.

Miscellaneous Exhibits.—Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., staged a large group of cut *Roses*, being the most prominent exhibit in one of the tents, also a few florists' arrangements, and a collection of hardy flowers.

Messrs. B. MALLER & SON, 61, High Street, Lewisham, showed table decorations, hardy flowers, &c. Messrs. G. RAINBIRD & SONS, Manor Lane, and Railway Approach, Burnt Ash Hill, also exhibited. THE HORTICULTURAL AND AGRICULTURAL ASSOCIATION displayed vegetables said to be grown from their seeds, and another stand was devoted to the display of *Ichthemium* guano.

HANLEY HORTICULTURAL FETE.

JULY 6.—This fete, which promises to be one of the best in the kingdom, was held on the above date, when over £1,500 was offered in prizes.

Amongst the exhibitors are some of the best known names, including JAMES CYPHER, of Cheltenham, who took 1st prize of £20, for a group of plants not exceeding 300 square feet (this award also carrying with it a special prize in the form of a handsome Vase, value five guineas); 1st also for six plants in flower and six in foliage, and 1st for *Palms*, as well as 2nd for group of *Orchids* (£10), and eight exotic *Orchids*. Mr. VAUSE, Leamington: three 2nds, one 3rd and 5th.

Mrs. LOVATT, Newport, Salop, principally exhibiting vegetables and fruits, took three 1sts, two 2nds, and six 3rds.

MESSRS. A. DICKSON & SON, Newtownards, co. Down, took 1st for forty-eight, twenty-four, and twelve *Roses*, 2nd for thirty-six.

Mr. J. H. Goodacre, gr. to Earl of HARRINGTON, Elvaston Hall, was awarded 1st for dinner table decoration six dishes of fruit, two bunches black Grapes, and one dish of *Strawberries*; and 2nd for scarlet-fleshed *Melon*; whilst Mr. Read, gr. to Lord CARNARVON, Bretby Park, who sent a large number of exhibits, carried off altogether fourteen prizes in fruits and vegetables, being four 1sts, eight 2nds, and two 3rds.

MESSRS. PERKINS & SONS, Coventry, with three exhibits took three 1sts for a basket of flowers, a grand bouquet, and a ball or bridal bouquet.

THE DUKE OF SUTHERLAND was awarded 1sts for eight *Orchids*, twelve table plants, twelve *Carnations*, six *Nectarines*, dish of cherries, French Beans, and white Turnips, as well as half-a-dozen 2nds and 3rds.

LADY THEODORA GUEST, Sir J. W. PEASE, M.P., Lord BAGOT, J. C. WATERHOUSE (of Preston), D. PRIOR & SONS (Colchester), and TOWNSEND & SONS (Worcester), were also among the more successful exhibitors. Nearly every class filled, and nearly every prize was awarded.

There were some splendid exhibits among those sent in, but not for competition, and the Committee authorised the judges to mark their sense of this by a liberal award of gold and silver medals, the most notable of these being the gold medals to Messrs. CARTER & SONS, for miscellaneous collection of flowers; CHARLESWORTH & CO., Bradford, collection of *Orchids*; Earl HARRINGTON, *Carnations*; ICHTHEM MANURE CO., Ipswich; W. & J. BIRKENHEAD, Sale, for Ferns; SANDER & CO., St. Albans, for a new plant (*Calyphadri* [?]); B. R. DAVIS, Yeovil, *Begonias*; J. H. WHITE, Winchester, cut hardy flowers; M. DICKSON & SON, cut flowers; and Mrs. HODGKIN, West Didsbury, for a very beautiful collection of skeleton leaves. Silver Medals: JOHN PEED & SONS, West Norwood, for *Caladiums*; H. WALTON, Handsworth, collection of *Cacti*; ECKFORD, of Wem, for Sweet Peas, and also merit award for new varieties; W. EDWARDS & SON, Sherwood, for Ferns; B. HARTLAND & SON, Cork, for *Begonias*; W. SYDENHAM, Tamworth, for *Violas*; JENKINSON & SON, Newcastle, for cut flowers; JARMAN & CO., Chard, Somerset, for miscellaneous collection of flowers; WEBB & SONS, Stourbridge, for large-flowering Sweet Peas, including two new ones, "Elsie Evans" and "Annie Evans"; the last-named firm had also a splendid show of *Eclipse* *Gaillardias*, *Hybrid Delphinium*, and *Intermediate Stock* *May Queen*.

At the time of writing, the entrances to the park are thronged, and many thousands have been admitted, and it

is hoped the spirited enterprise of the Corporation of Hanley will be successful.

The judges included Mr. Thomas (Windsor Castle) and Mr. Outram (London), for groups; Barnes (Eaton) and Elphinstone (Shipley Hall), for cut flowers; Cranston (Hereford) and Gilman (Alton Towers), *Roses*; Speed (Penryn) and Edmonds (Bestwood), vegetables; and Goodacre (Elvaston) and Wallis (Keele), fruit.

EALING HORTICULTURAL.

JULY 6.—The leading feature of this Exhibition, which was held in the grounds of Hanger Hill House, the residence of Sir E. MONTAGUE NELSON, was undoubtedly the *Roses*.

Prizes are offered for forty-eight blooms, and not more than two of any variety can be shown. On this occasion four of the leading trade growers competed, Mr. B. R. CANT, Colchester, taking the 1st prize with some glorious blooms, chief among them being *Marie Baumann*, *Mrs. J. Laing*, *Gustave Piganeau*, *La France*, *White Lady*, *Ulrich Brunner*, *Mrs. R. Sharman Crawford*, *Marquise Litta*, *Lady M. Fitzwilliam*, very fine; *Mrs. W. J. Grant*, in remarkably good character; and *Capt. Hayward*, very fine in colour and petal, but lacking fulness. Messrs. G. & W. BURCH, nurserymen, Peterborough, narrowly excelled Mr. C. TURNER, who was 3rd. Mr. TURNER showed a very promising soft pinkish blush-tinted variety named *Edith Turner*, which is very attractive.

A Silver-cup offered to local growers for twenty-four varieties was won by Mr. MAURICE HULBERT, who had some fine varieties. *Noisettes* were small, the season appeared to be too early for them.

Plants filled a large tent, and there were two classes for groups, Mr. J. HARRIS, North Common Road, Ealing, taking the 1st prize with a very pleasing arrangement in the principal class, and Mr. H. PEAL, in the smaller one. Stove and greenhouse plants and Ferns were fairly well represented, and there were some admirably grown *Caladiums*, *Ville de Hambourg*, with a rich colouring and bright rosy red, and *Salvator rosea*, light, being very good.

The character of the plants of *Streptocarpus* proved that their culture is well understood in this locality.

Miscellaneous Exhibits supplied some fine features. From Gunnersbury Park, Mr. GEORGE REYNOLDS, and from Gunnersbury House, Mr. JAMES HUDSON staged large and delightful groups of plants. Both had the new *Acalypha Sanderiana*. Mr. REYNOLDS made use of some fine patches of *Epidendrum vitellinum majus*, and Mr. HUDSON of a rare bit of *Vanda corulea* of a rich deep colour. Messrs. C. LEE & SONS and W. FROMOW & SON supplied very fine groups of plants that were fine features. From the Royal Nursery Slough, Mr. CHARLES TURNER sent twenty very fine specimen *Pelargoniums*, among which *Persimmon*, *Royal Ascot*, and *Prince of Orange* were the more brilliant in colour. Messrs. JAMES VEITCH & SONS sent a very fine collection of cut *Roses*, also bunches of Sweet Peas, and *Heuchera sanguinea grandiflora*. Mr. GEORGE CANON, St. John's Nursery, staged a good group of plants.

Obituary.

WILLIAM HERNE.—This well-known gardener, of Hanbury Hall, near Droghda, died of apoplexy on Sunday morning, June 26, twenty-four hours after the seizure, at the age of 59. He was well known in the Midlands, where he served the late Colonel Ratcliff, Edgbaston; the late James Watson, Esq., M.P., Warley Hall; and Sir Harry Vernon, Bart., of Hanbury Hall. He will be remembered in the neighbourhood of Birmingham as an exhibitor, and maintained a close connection with the Birmingham Chrysanthemum Society since its inception. The latter years of his life were devoted to market-gardening. He was laid to rest in the churchyard of Hanbury, amid expressions of grief and regret. He leaves a widow, four sons, and a daughter.

MR. T. BONSALE.—We regret to have to record the death of a worthy Yorkshire gardener, at the early age of forty-nine years. The deceased had been about ten years head gardener at Elmet Hall, Leeds, the residence of J. H. Kitson, Esq., and he was a capable gardener and respectable man. Elmet is famous for its alpine and herbaceous plants; and has a nice collection of *Orchids*, besides the usual adjuncts of a gentleman's country garden, and these were well managed by the late gardener. A description of Elmet Hall gardens appeared in our issue for May 5, 1894, and a view in the garden a week previously. The post of head gardener is filled, as is stated in another column, by a young gardener from Grimston Park Gardens, who has for five years enjoyed the advantages of having served as foreman under Mr. Clayton, the head gardener at that place.

MARKETS.

COVENT GARDEN, JULY 7.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

REMARKS.—The Southampton Strawberries may now be said to be done (when this is read). There is not, as far as I have seen, anything you could really describe as a fine sample; the same remark applies to the Kentish Pecks, of which there are thousands coming daily. Of Punnets, the best I have seen were grown in Middlesex. No doubt this week will finish Southamptons, and the bulk of those which come early. Of Peas, the sorts are various, and all in fairly good order. The American Wonder, which I think I know under another name, seems to be a leading article; of dwarf habit, and heavy cropper, the pods are not long, but they contain, when developed, a lot of corn. Gooseberries this week have been down in price—1s. 6d. to 2s. 6d.; few of the last-mentioned price realised. Spinach is now a most erratic vegetable, thus the variation in prices, because one day it's fit, the next it's run. Potatoes are Puritans, Monarch, White Hebrons, and Kidneys.

POTATOS.

Home grown 100s. to 140s.; Jersey and French 95s. to 110s. per ton. John Bath, 32 and 34, Wellington Street, Covent Garden.

TRADE NOTICE.

We are requested to state that Messrs. Brown & Sons, Seedsmen, formerly carrying on business in Baldwin Street, Bristol, have removed to larger and more convenient premises at 31, Bridge Street, close to Bristol Bridge.

NOTICES TO CORRESPONDENTS.

APPLE SHOOTS: *G. K. Gude*. The shoots and leaves are badly infested with mildew. You should remove and burn the worst affected, and dress the foliage with the Bordeaux Mixture, or with flowers-of-sulphur, dissolved first in a small quantity of water as you would prepare mustard for the table, and then incorporate it in soapsuds made with soft-soap at the rate of 3 oz. to the gallon of water. About 2 oz. of sulphur (dry) is an effective dose in a gallon of suds. If the mixture be well made, it can be applied with an ordinary garden-syringe or engine.

CARNATION FLOWERS: *W. R.* The white flower is very pure, and the flaked one most attractive. In either case the calyx is good, and for the border the varieties should be valuable, but they are not necessarily improvements upon varieties already existing.

CHICORY: *J. W. C.* There is the "Red Italian" Chicory in which the red colour is found mostly in the mid-rib, but it extends to the whole leaf faintly. Seeds could be obtained of MM. Vilmorin Andreux & Cie., of Paris, or of MM. Dammann & Cie., Portici, Naples.

CORMS OF THE BRIDE GLADIOLUS: *R. A.* If you could cover the bulbs with hand-lights or frames, and keep the soil dry after the plants die down, there would be no need to lift them, otherwise lifting is necessary. By lifting and resting, and re-planting part of the stock late in September under frames, early bloom may be obtained. The remainder might be kept till March in a dry, cool place, and then planted.

CUCUMBER HOUSES: *A. B. C.* There are various kinds of plants that might be grown in them where the shade is least—say, Maidenhair Fern, Pteris tremula and other varieties, seedling Asparagus officinalis, sown thickly in 60's; Tradescantia zebrina and its varieties; Cyperus, Selaginella Mertensii, S. denticulata, and S. apoda, Oplismenus Burmanni variegatus (Panicum).

CUCUMBERS: *W. T.* A very bad case of Eel-worms at the roots. There is no cure possible. The worms exist on the roots of grasses and other wild plants, and are brought in with the soil. All soil should be at least one year in a stack, which should be kept quite clear of herbage. Clear out, and start anew.

FOSTER'S SEEDLING GRAPE CRACKING: *J. A.* This variety is not liable to this malady, and it is the more unaccountable as Madresfield Court, a variety that is liable to crack under certain conditions, is growing in the same vinery. It may be due to something wrong with the border, and can scarcely be brought about by your management of the vinery; or you may have Oidium Tuckeri in the Vine. Please send some of the berries for inspection.

GRAPES: *J. McClelland*. The bunch sent is badly infested with the fungus that causes the "spot" disease. There is no known cure, and you should cut out every berry that shows the least sign of pitting or spotting, and burn it; and dress the bunches forthwith with sulphide of potassium at the rate of ½-oz. in a gallon of rain-water to ward off future attacks. The bunches should be syringed in a day or two to remove the sulphide. The name of the fungus is Gloeosporium læticolor.

GRAPES: *R. S. Sunderland*. If White Frontignan Grapes are shown in a class for Muscats, the exhibit would be beaten by Muscat of Alexandria or other variety, or it would be disqualified as not being what it was intended should be shown. It is usual to show these small-fruited varieties in a class apart.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*E. J. P.* Tamarix germanica.—*H. W. E.* Buddlea globosa; Nat. Order Scrophulariaceae.—*J. B. R., Plympton*. Dendrobium Pierardi.—*H. K.* Dendrobium moschatum of that variety often called D. calceolus; and

Stanhopea eburnea.—*W. T.* The handsomest form of Oncidium macranthum we have seen. It is recorded in the present issue, p. 22.—*Douglas*. Sibthorpia europæus variegatus (Cornish Moneywort).—*C. D. Knight*. Ophrys apifera, the Bee Orchis; a British species, generally found upon chalk hills.—*John McLogan*. Helichrysum rosmarinifolium.—*Nurseryman*. Pyrus lobata (Mespilus Smithi).—*W. F. G.* 1, Hordeum murinum; 2, Lolium remulentum; 3, Bromus mollis; 4, Phleum pratense; 5, Bromus erectus; 6, Bromus mollis.—*W. H. M.* Viburnum plicatum.—*F. D.* Medicago denticulata.—*Alice Holt*. Euphorbia amygdaloides.—*Dr. B.* Hæmanthus multiflorus.—*Thos. Rogers*. Spiræa canescens (Himalaya).

PROPAGATING-CASE: *Disconsolate*. The so-called propagating-case is not required to strike cuttings of the plants named. Poinsettias and Euphorbias strike well without bottom heat on a shelf in the stove, without bell-glass or any covering whatever, that is if ripe wood be employed as cuttings. They need very little moisture in the soil till roots form. If green shoots are employed, it is best to take a thin heel of last year's wood as well; such cuttings strike in a hotbed frame or under bell-glasses on bottom heat, and they would succeed in a case, but require daily airing for 10 minutes, or damping off will occur. The leaves should be tied to a stick erect, and not allowed to flag. Begonia Gloire de Lorraine strikes from small cuttings coming direct from the roots, and to obtain these the main growth has usually to be cut hard back. They should be put into sandy loam and peat surfaced with sand, one each in a thumb-pot. They need mild bottom heat and not much covering up. None of the plants you name, excepting the first two, are the better for damping overhead; moreover this practice is never advisable in a close case, as it would render damping off a certainty with many species of plants. If you damp cuttings overhead they should as a rule be those that are exposed to the air of the propagating-house. The direction keep "close and moist," does not mean that the cuttings are to be sprinkled, usually it is sufficient to moisten the bed or floor, or plunging materials of the case.

TOMATOS: *H. J. G.* The fruits have the "spot" disease. See answer to "Burns," in our issue for June 25, p. 400. No cure.

TRAVELLING GLASSHOUSES AND ROSES: *A. B. C.* If the pot Roses comprise suitable saleable varieties, and they are planted forthwith without root disturbance, and well done during the current season, the glasshouse might be run over them in late October, resting them cool and dry for a month or two, and then closing the house partially for a time, afterwards raising the internal warmth, and affording water to the soil, so as to get the plant in bloom early in the winter.

TYROLESE PLANTS: *X. Y. Z.* 1, Pack in ventilated boxes in damp moss. The transit through the post takes only two days from Vienna, and perhaps one day out of the Tyrol. 2, Obtain the "Synopsis of European species of Primula," by J. G. Baker, in the Journal of the Royal Horticultural Society, vol. vii., 1886. 3, The Parcel Post obtains between Austria and this country.

COMMUNICATIONS RECEIVED.—*M. D.*—Mons. S.—*A. T.* De la Mare.—*H. B.*—*E. L.* Gembloux.—*R. J. L.*—*J. R.* Altrincham (many thanks).—*H. J. G.*—Young Gardener.—*J. Slater*.—*M. A. Dinter*.—*A. B. DIED.—On the 1st inst., at Mortlake, Mr. William Stevens, a respected Market Gardener, &c. Aged 67.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For remainder of Markets and Weather, see p. ix.)

THE

Gardeners' Chronicle.

SATURDAY, JULY 16, 1898.

DALKEITH IN JUNE.

LITTLE more than half-a-century has elapsed since a horticultural writer in 1845 declared that Scottish nurserymen catalogued from two to three hundred double-flowered Scots Roses. The intervening interval of time since then has seen their decadence, and all but the extinction of these numerous varieties; and it is doubtful whether any trade firm in Scotland could to-day supply more than a dozen varieties. The facility with which they could be increased by means of seeds, and a sameness in the appearance of many of the varieties, combined with the rapid improvement of H. P.'s and other sections of popular Roses, appear to have been fatal to their existence. At any rate, their reign was a short one. I can find no account of any existing in the last century, and at the beginning of the present. I have discovered one double variety only. Hogg, in the 2nd edition (1822) of his *Treatise on the Carnation, &c.*, names seven varieties, and also remarks, "The Scotch Roses that have been raised from seeds within these few years past are exceedingly fine and delicate, and make a great addition to the flower-garden." About the beginning of the forties, many hybrid varieties were raised by French florists, but these would appear to have been wanting in the characteristics of the true Scots Rose. Stanwell Perpetual, raised at an earlier date, is the sole remaining representative of the hybrids. Its delicate pink buds, its fragrance, and its habit of flowering continuously from May onwards, cause it to be cherished in many gardens.

The connection of these remarks with "Dalkeith in June" will appear when I mention the fact that the grounds and gardens "familiar in the mouth as household words," belonging to the Duke of Buccleuch, and managed in succession during the greater part of the present century by a trio of great gardeners, still contain the remains of a collection of double-flowered Scots Roses, selected by Mr. Macintosh in the end of the forties as the cream of the varieties then in cultivation. The collection originally comprised some 150 varieties, all named, and considered by connoisseurs of the period to be distinct.

The plants form a broad natural hedge, extending to a length of over 100 yards, and their inspection formed the primary object of my visit. They were found as near perfection as Mr. Dunn's judgment had previously concluded they would be. A few of the earliest to flower were going off, and some of the latest were just showing their first opening buds, but the majority were at their best, and it was possible to see every plant more or less in character. Most unfortunately their names were long ago

lost, but they are now all numbered and their characteristics noted, and as Scots Roses may before long assume the position they deserve in gardens, it may yet be not impossible to supply to them their original designations.

As decorative objects their effect is not confined to the flower-garden. The buds are in constant demand for personal decoration, and the long curving shoots, closely studded with buds and expanding blooms, and with neat dark green foliage, are of the utmost value for vase furnishing. Smaller sprays form an admirable setting to blooms of W. A. Richardson or other Roses when laid on the cloth as a table decoration.

The fragrance of the blooms in a mass, as at Dalkeith, is, moreover, very great, and is diffused to a distance. Like the Sweet Briar, the flowers are most fragrant in the evening. The varieties include a few white forms, one of which, very early, is noteworthy on account of the chaste form of its expanded blooms. Another of the prettiest is somewhat late to flower. Of this the expanding buds are barred light purple on dull white, but when fully expanded, the flowers are of various shades of delicate pink and blush, and sometimes white. The petals are large and cupped, and the bloom consequently deep for a Scotch Rose. The above two I thought the best of the collection. Two late varieties, dwarf and distinct in habit, are respectively of a very light and a darker shade of purple. Not a few varieties are mottled, and some of these sport to white, so that on the same stem there may be double mottled, double white, and sometimes single flowers. The shading of some of the flowers it is impossible to describe; one has the merest suspicion of pink flushing on the petals, while yet another is all but red in its markings. Here, again, is one with a dark salmon centre, with a broad, fairly-defined, lighter edging. Another equals it in beauty, the lovely pink of *Rosa alba*, Celestial; and among others are fawny and creamy tints which are most charming.

Growing in close proximity to the Scotch Roses is a shorter hedge of a variety which Mr. Dunn esteems very highly. The flowers are cream-coloured and single, the foliage neat, closely set on long and graceful shoots, and the scent Sweet-briary; it is named *Rosa elegantissima*, but I can find no trace of it in any work or article on Roses. May it not be the old "Yellow Sweet Briar?" I have grown it for a year or two, and like it much for mixing with flowers as a green setting. For this purpose it is largely used in the ducal establishment.

These are, however, not the only old Roses that flourish at Dalkeith, between the tall Holly-hedge which cuts off the orchard from the strip of lawn lying south of the kitchen-garden, a very old Rose-covered trellised walk still exists. The Roses are nearly all very old, some of them, as the double Briar, scarce; others, very ragged looking members of the family, perhaps unique. But among these are many Ayrshire Roses, such as Dundee Rambler; Ruga, and Queen of the Belgians, *Félicité-Perpétue*, *Acidalie*, a climbing single white, &c. The length of walk thus covered extends to over 500 feet. At one end it is terminated by a deeply set-in semi-circular Rose-arbour paved with stones. The corresponding arbour for the other end is set back a few yards at the end of another walk terminating against the Holly-hedge mentioned above, and stands at a right angle to the usual position. The age of this very fine example of

a covered-walk with its terminating arbours is about 140 years. The original oaken posts set into sandstone bases are still intact, but the wooden laths have unfortunately been replaced by iron wires. It was removed hither from its original position in the old gardens, about a mile distant, when the present gardens were made by Macintosh about sixty years ago. Its eastmost end abuts on a sloping lawn studded with flowering and ornamental trees and shrubs, very noteworthy among which is an English *Laburnum* of extraordinarily large and graceful proportions. There are also many interesting specimens of Conifers and broad-leaved trees, including a very large and fine specimen of *Taxus adpressa*, clumps of Japanese Maples, a *Torreya myristica*, a circular bed containing seedling plants of *Sciadopitys verticillata*, with *Saxa Gothæa conspicua*, &c. Here a dividing wall with its border is utilised for the cultivation of the more rare shrubs. Many of these are late introductions which are being tested, both as regards their ornamental qualities and hardiness. For example, *Hedera amurensis* is growing freely on the wall; *Clerodendron trichotomum* is doing fairly well, but as regards Scotland it remains a doubtful subject; *Cercis Siliquastrum*, which fails in the open, succeeds on this wall. At Beil, East Lothian, a splendid specimen of this tree exists, supposed to have been planted by Street, a contemporary of Macintosh. Another shy plant in the open, *Escallonia Philippiana*, grows well on the wall. Here, also, *Viburnum plicatum* was flowering freely, and the species of *Elæagnus*, but all these succeed without protection. *Xanthoceras sorbifolia* is also trained on this wall, but it will also grow fairly well in the open.

In the border a very large collection of ornamental shrubs were mostly all doing well. Such are the newer hybrid Weigelas, the value of which has not as yet been fully determined. *Amygdalus Davidiana* in three varieties, very hardy, free-flowering, and early. Mr. Dunn prunes these as tall standards. Many species and varieties of *Spiræa* were also noted, *S. Thunbergi*, the earliest of all, *S. confusa*, *S. Van Houttei*, and *S. rotundifolia*, a trio with much in common, the last-named perhaps the most worthy of cultivation; *S. ariaefolia* was well budded, and the *S. callosa* section, of which Anthony Waterer is doubtless the best, were showing incipient corymbs on the ends of the shoots. *Spiræas*, it may be noted, prefer a deep holding-soil; otherwise they must be regularly manured and the weaker growths removed. *Choisya ternata*, the "Cherry Pie" of Cornwall, was flowering quite freely, as was also *Olearia macrodonta*, while the smaller, and perhaps prettier, *O. Haastii* was bristling with buds. I was very pleased with *Cytisus pallidus* and *Daphne hybrida*, with flowers not unlike one of its parents, *D. indica*. The aromatic *Caryopteris Mastacanthus* was growing well, and it also flowers profusely at Dalkeith. There is a white variety which, as yet, I have not seen.

Of variegated Dogwoods there is a fairly full collection. *Cornus Spathi* had been nipped by cold, as it not unfrequently is. A very good substitute, however, and equally effective, is found in *Syringa Emodi variegata*; and *S. E. aurea* is one of the best pure yellow-leaved plants, much better than either Weigelas or *Spiræa opulifolia*, with yellow leafage. The Golden Privet, however, is a most desirable plant, and a favourite at Dalkeith. *Parrotia persica* fails to colour here in autumn, and is, therefore of

little value; but *Ampelopsis japonica* does well, and dies off in the most lovely combinations of cream, green, rose, and crimson.

Shepherdia argentea attracted attention by the delightful blending of its yellowish silvery-green foliage. A nice specimen of *Daphniphyllum glaucescens*, the red-foliaged variety, bids fair to become a standard shrub; the foliage, unfortunately, is here much smaller than that produced under the warmer skies of the south of England. Here we had given up *Quercus glabra*, but in a warm corner at Dalkeith it is doing well. *Ptelea trifoliata* var. *aurea*, an old plant, was very fine.

Interesting shrubs with minute foliage are represented by *Buxus myrtifolia*, the plant sixty years of age, and not exceeding 3 feet in height. Equally interesting was *Ilex Fortunei*, and the curious, small-leaved *Philadelphus macrophyllus*, which Lemoine has been utilising in the raising of new hybrids. Very uncommon is a variety of the common Laurel, named *Camelliaefolia*, having convoluted leaves. The hardy "Orange," *Citrus trifoliata*, appeared to be thriving in Scottish air. Hollies are a leading feature, and the collection includes every variety of note, and all the species that will bear the climate.

Of flowering-trees there is quite a large number, such, for instance, as *Buddlea globosa*, *Kolreuteria paniculata*, *Halesia hispida*, and *H. tetraptera*, *Sophora japonica*, *Pavias*, and many more, which it is impossible in a short sketch to mention.

No portion of the extensive gardens at Dalkeith is probably of greater interest to a gardener than the large orchard lying on the broadened slope, terminated by the North Esk River, which flows just outside the boundary. On the opposite side is a haugh, where on the lush-grass, among large trees, full flushed in their summer foliage, a few cows feed. Just beyond is the ancient burgh of Dalkeith, with its tall spires picturesquely crowning the ridge between the North and South Esk Rivers; and further off a delightful stretch of undulating country, field, wood, and hill, meeting the distant horizon. It is a fair prospect. But earlier in the year, when Plum is succeeded by Pear, and Pear by Apple-blossom, the sojourner on the other side the river has then the advantage.

The trees in the orchard, which is closely cropped with vegetables, consist mainly of standards on tall stems. In addition to these, however, there are large numbers of pyramid-trained Apples, Pears, and Plums. Appearances point to a fine average crop of all. In the course of conversation Mr. Dunn incidentally remarked that the Dalkeith collection embraced about 180 sorts of Plums, of which only a few of the best are grown in quantity, Pond's Seedling and Gisborne's being considered the best for standards. Of Apples there are about 700 kinds, which it was agreed might, with advantage to the grower, be reduced to about two dozen varieties. Pears are represented by about 500 sorts, and here again a few popular varieties were esteemed sufficient for working purposes. I took the opportunity to request Mr. Dunn's opinion of the value of Apple-trees grown as pinched dwarfs, and of Pear-trees as free-growing pyramids. The former he considered of value only so long as unremitting attention was accorded, but one year of neglect in details ensured their ruin. Concerning the last-named, Mr. Dunn, while agreeing that large crops were annually secured, yet exhaustion super-

vened sooner or later, and the trees required to be replaced by others.

It is one of the signs of the times that this large orchard is not exempt from the ever increasing crush of flowering plants, which seem to overflow into all departments. A double row of herbaceous *Pæonies* is a very old feature, but *Phloxes* and other flowers for cutting are novel. So also in the kitchen garden, long lines of *Pinks*, *Lychnis*, *Viscaria splendens*, various *Pyrethrums*, and glowing Eastern *Poppies*, as well as Sweet Peas, Carnations, and *Dahlias* yet to bloom were largely in evidence. The main central borders were brilliant with *Violas*, planted diversely in squares, the varieties comprising the whole of those that have received awards at Chiswick. A neat mulching of dry horse-droppings covered the surface of the ground between the plants, and here it may be said that this material is largely used as a mulch both outside and in the fruit-houses. Also in the kitchen garden, filling the west, east, and south borders, in the space between the walks and the dwarf Apple-trees next the cropping quarters, herbaceous flowering and alpine plants are grown. These borders are too narrow to be effective, but they are most interesting, and no doubt valuable adjuncts to the floral department, and as grown at Dalkeith without staking the plants do not consume much time in their culture. It is, I think, not generally known that the greater part of the plants suitable for such borders as those under discussion are best grown without staking at all. Where support is required, a piece of string tied so as to keep the stems from opening outwards is in all but a few cases the whole that is needful.

A rapid walk through the glass department shows that here, as elsewhere in these gardens, while the best of the old is preserved, the novel is also given its place. The newer Cannas, the best *Caladiums*, border Carnations in pots for early summer flowering, and *Streptocarpus* are a few of the latter.

The almost endless stretches of glass structures filled with Grape-vines, Peaches, Melons, Pines, Figs, Guavas, Bananas, and hardy fruits can only be mentioned, and one can only assume that, with a staff not large for the demands upon it, its controller must have all his wits employed to keep Dalkeith, inside and out, in the perfect condition we found it on that June day, when the Scots Roses were so beautiful. B.

CURE FOR THE LILY DISEASE.

IN common with many other amateur horticulturists, I have long been troubled with that widely-prevailing pest, known as the Lily-disease, and the yearly disappointment of seeing my Lilies come up merely to blacken and wither away before they reach the stage of bloom has led me to investigate the matter, with a view to the eradication, or, at least, the mitigation of the evil.

Some few years since I took up the whole of my bulbs of the *Lilium candidum* to the extent of about 2 bushels, for I thought that by a judicious selection of the strongest among them, and by replanting in the most favourable positions, I might be able to improve the then gradually degenerating blossoms. In spite of this, the disease made rapid headway, so that of late I have had but a few poor sickly stems in the whole of my garden. I consulted the County Council lecturers of this district, both of them Fellows of the Royal Horticultural Society, only to receive the discouraging information that this mysterious disease had defied all research and all efforts for its cure; and I have read a recent article in

the *Standard* to the same effect. The several attempts made to procure a healthier stock by the importation of fresh bulbs from Holland have not met with the success they deserved, for the new arrivals have been quickly reduced to the state of the old, apparently worn-out bulbs, by the ravages of the same disease. Hence this strange visitation has practically been stated to be an incurable disease.

I have given the subject some thought for a considerable time past, and from what is exemplified at the present time in my own garden, I believe I may state that I have discovered a cure for this persistent evil, which is remarkable at once for its simplicity with effectiveness. My final experiment dates back to the autumn of 1896, and was confined to three groups of the bulbs; last season they showed a marked improvement in the blossom-heads, which appeared to be entirely free from the disease, though still evidently somewhat weak from its effects in previous years.

This summer I have the pleasure of seeing them perfectly healthy and well grown, with fine green stems and leaves, and the promise of large heads of bloom. Other groups in my garden, which have not been treated, have not a single blossom-stem, and some of them are so far diseased that they have almost disappeared.

Disease and health could not be more exemplified than here, and I shall be pleased for anyone to see and compare them.

And now for the remedy, which anyone may try, I hope with the same pleasing success which has attended my own efforts. In the autumn of 1896 I removed the bulbs from the ground, and after they had dried somewhat I put them into a large brown-paper bag, in which was a supply of flowers-of-sulphur; they were then well shaken up until the sulphur had been worked thoroughly into the crevices. After this, and while still well smothered with the powder, they were planted straightaway, with the results which I have described. I feel disposed to give the credit of my investigations to the Royal Horticultural Society's lecturers of the West Sussex County Council, who first aroused my attention to this subject.

From the nature of the disease I felt sure it must emanate from the bulb, for the bulb-leaves are the first to be attacked; and it then proceeds upward through the stem to the flower, which is the last to be affected.

This season I propose to treat more in the same way, and I shall be pleased to hear that others, whose plants are affected with the disease, have also tried this simple remedy with success. *Horace Byatt, M.A., The Grammar School, Midhurst, Sussex, June, 1898.*

KEW NOTES.

MAGNOLIA PARVIFLORA.—Strictly speaking this is not a new plant, having been described by Siebold and Zuccarini as long ago as 1843, but it has only been introduced during the present decade, and is still practically unknown to cultivation in Britain. Some plants, obtained from Japan, flowered at Kew in 1894, and have done so once or twice since, but the true beauty of the species has not been indicated, nor even suggested, till now. Since the second week in June, a plant growing in the Bamboo garden has been beautifully in flower. It shows the species to be a great acquisition among hardy shrubs, and quite distinct from any *Magnolia* grown in this country, except it be the still little-known and hitherto unsatisfactory *M. Watsoni*.

The flowers of *M. parviflora* are 3 to 4 inches across, cup-shaped, the six petals being very concave, of the substantial texture common to the *Magnolias*, and the largest of them 2 inches long. At their best they are almost snow-white, against which the deep rosy-crimson of the stamens shows in beautiful contrast. These stamens are, indeed, the great feature of the flower, being arranged in four or five superimposed rows on the central column, on which is also borne the cone of yellowish-green carpels; thus they form a flat wheel-like circle 1 inch across. The three sepals are drooping, and of scarcely so pure a white as the petals. When once established this

Magnolia promises to grow freely. It has at any rate made vigorous healthy growths during the last two seasons. The leaves are obovate or oblong, from 3 to 6 inches long, dark green and glabrous above, paler below, and covered with a close pubescence that is more particularly noticeable on the mid-rib, veins, and flower-stalks. All the plants in cultivation have been introduced from Japan, which has generally been regarded as its native country. Prof. Sargent, however, doubtless with good reason, says it is one of the numerous trees and shrubs introduced into Japan from China and Corea.

MAGNOLIA WATSONI.

Owing to its having been mistakenly called *M. parviflora*, this *Magnolia* has become somewhat confused with the true species of that name just dealt with. The two are not, however, difficult to distinguish, although they are more nearly related to each other than to any *Magnolias* in cultivation. *M. Watsoni* is a sturdier plant, and less graceful than *M. parviflora*; its oblong leaves are larger; the flowers, besides

with the graceful habit and distinctness of the plant itself, they entitle the species to a place among choice hardy shrubs. It is remarkable that a shrub so hardy as this has proved to be—both at Kew and in the Arnold Arboretum—should be a native of New Mexico and Arizona, two of the hottest of the S.W. United States. During the last few years a plant has flowered very profusely in June. It is a graceful bush about 4 feet high, with slightly glaucous, smooth, narrow leaves, about $1\frac{1}{2}$ inch long. The flowers are borne on the previous season's growth, and hang gracefully from the lower side of the branches, often in rows 1 foot or more in length. Each flower is solitary on a short, slender stalk, and in shape is not unlike a *Streptocarpus* flower, the lower part of the corolla being tubular, but expanding at the mouth into five slightly reflexed lobes. The entire flower is nearly 1 inch long and over half an inch across, the colour being a singular but pretty shade of green, tinged and lined with purple in the throat. The species, which is the only North American one in cultivation, was discovered by Fremont in 1843.

FIG. 11.—*PHALÆNOPSIS LUDDE-VIOLEACEA*: COLOURS CONSIST OF TWO SHADES OF PURPLE.

RHODODENDRON SMITHI AUREUM.

Considering the rarity of yellow-flowered, ever-green *Rhododendrons*, and the beauty of this particular one, it is strange that it is not more often seen. It is about sixty years ago since it was raised by Mr. Smith, a nurseryman at Norbiton in Surrey, who showed it in flower at the rooms of the Horticultural Society in Regent Street in 1841. Mr. Smith described it as a cross between a seedling *Rhododendron* of his own and "the yellow-flowered *Azalea sinensis*." It was thus the first (and is still not far from being the best) of the hybrids to which the name *Azaleodendron* has been given. It would be interesting to know if any of the readers of the *Gard. Chron.* have large bushes of it, and to what size it grows. I have only seen comparatively small plants, but have been charmed with its free-flowering qualities and its distinct colour. The truss is well formed, and the flowers are each about $2\frac{1}{2}$ inches across; Paxton, however, describes them as "above 3 inches across." The yellow of the corolla is shaded with brown on the upper-side, and numerous spots of a deeper shade also occur on the upper segment. The leaves are not large, and show distinctly the influence of the *Azalea* blood in the wrinkled surface. It is at its best out-of-doors in early June. *W. J. Bean.*

PHALÆNOPSIS LUDDE-VIOLEACEA.

A PLANT in flower of this very pretty garden hybrid, was shown by Messrs. J. Veitch & Son, of Chelsea, on June 22, at the Drill Hall, Westminster, from which our illustration (fig. 11) was prepared.

As seen, the flower, which measured 2 inches in extreme width, possessed petals and sepals of a light-purple colour, and lip of a richer shade of purple. The peculiar bar-like markings of amethyst seen in *P. Luddemanniana* were in the hybrid transformed into rather indistinct spotting, and in form the resemblance to this species was greater than to the other parent. It should be welcomed as another instance of success in crossing the *Phalænopsis*, and an earnest of other fine things in the future.

THE CANNA AS A DECORATIVE PLANT.

THERE is hardly a class of plants cultivated on the Continent which has seen such a marked improvement during the last fifteen years as Cannas, which have risen from mere foliage-plants to a foremost position among summer-flowering plants, as well as become important for winter flowering under glass.

Mr. Crozy, of Lyons, a noted raiser of Cannas, started this improvement by crossing the old *Canna Warscewiczii* with *Canna indica*, and it is to him that we are indebted for a great many fine varieties—the so-called "Crozy Cannas." Since, then, however, the work has been taken up with more or less success by gardeners in other countries, especially Germany; and of late years also in America, England, and Italy. In Germany, Messrs. W. Pfitzer and G. Ernst, Stuttgart, have added many fine varieties to the list; Messrs. Dammann & Co., of Portici, near Naples, have introduced several varieties. I shall, however, refer to these later on. The Americans seem to possess several fine varieties, but as yet these have not been tried in Europe, and for this reason I do not express an opinion upon them. In Stuttgart—in fact, on the Continent generally, Cannas are mostly cultivated as bed-group plants, or as single specimens on lawns, &c., or are planted in company with other foliage plants, as *Ricinus*, *Nicotiana*, *Zea*, *Musa*, &c., in order to impart a tropical aspect to the garden, and with their gorgeous blooms to impart brilliancy to the picture. They are lifted in the autumn, and stored in a frost-proof place until the spring, when they are started, pushed into growth, and planted out when the weather permits—generally in the month of May. They are not grown much for pot culture, although the colours, when grown under glass, are much more delicate than when grown in

RHODODENDRON CINNABARINUM.

Among the Himalayan *Rhododendrons* truly hardy in the London district, none differs so much from the usual garden type as this. There are several plants at Kew varying from 2 to 6 feet high, some of which have this year flowered very well. I have also seen the species finely represented in the gardens about Falmouth; but never a specimen so beautiful or so full of flower as one in Mr. Godman's garden near Horsham a few years ago. The flowers in general outline have been very aptly compared to *Lapagerias*, but they are scarcely so large, and the colour, although it varies greatly, is never the particular red of the *Lapageria*. It is oftenest a rich cinnabar-red, but is frequently shaded with yellow, sometimes with green, thus giving a variety of hues, but always beautiful, and for a *Rhododendron* striking. The small leaves are ovate or lanceolate-oblong, of a glaucous-green when young, and inclined to a rusty-red beneath when old.

LYCIUM PALLIDUM.

Most of the *Lyciums* are not particularly striking in regard to their flowers, being cultivated as a rule for the beauty of their fruits and for their free and graceful growth, especially in maritime localities; *L. pallidum* is, however, an exception. Its flowers are not only beautiful in comparison with those of other species of *Lycium*, but taken in conjunction

being larger (from 5 to 6 inches in diameter), are not of a pure, but of a creamy-white, and they are borne on short peduncles, usually about $\frac{3}{4}$ -inch long. The peduncles of the smaller-flowered *M. parviflora* are more slender and generally $2\frac{1}{2}$ inches long. Unfortunately, *M. Watsoni* is not proving so free a grower as the other; whether this is owing to some constitutional tendency, or to its being grafted on an unsuitable stock, I cannot as yet say. Its branches are apt to die off without any apparent cause. Still, plants are now showing flower at Kew.

the open, and all the dwarf varieties are more or less suitable for pot culture.

It is, however, mainly in the hope of seeing Cannas become more popular in England for bedding purposes, that I write these lines, especially in the south and south-western counties, which are well suited for their cultivation out-of-doors. It must be borne in mind that Cannas require warmth, and we must, of course, choose a warm position in the garden, and one that is especially sheltered from strong winds. There are, however, certain free-flowering and vigorous varieties which will stand a good deal of bad and rainy weather without injury, and by making use of these more especially, we can rely on having a passable show even in not over favourable sites. I believe, however, that by strict selection and crossing these hardier varieties, we may in time possess a strain of Cannas which even in the changeable climate of England will be independent of the vicissitudes of the climate.

It is just in this respect that the Canna Italia and Austria of Messrs. Dammann & Co., large and beautiful as they are, in my opinion, are of little value for planting in cool climates, for apart from the fact that their flowers, even under glass, do not last longer than about half a day, they are so delicate as to suffer injury very easily. Canna Burbank seems to have a similar constitution; but, as I before said, not having had an opportunity of forming an opinion of these American varieties, I cannot say so definitely. If, however, by again crossing, we could impart the durability and length of flowering of the ordinary run of Crozy's Canna to Canna Italia and similar varieties (Messrs. Dammann & Co. announce about twelve or fifteen similar new varieties this spring), the gain would be great indeed. Should this happy stage be reached, the value of Cannas for decorative and cutting purposes will at once be apparent when we consider the large range in fine colours, and the ease with which the plants may be brought to flower in the winter months.

It is somewhat bewildering at first to make a good selection from among the great number of varieties in existence at the present day, and the yearly addition of novelties from all sides; but from personal observation during the last few years of the collections of Mr. Pfitzer and Mr. Ernst in Stuttgart, the following may be recommended as being good varieties:—

Older Varieties, which, owing to their possessing various good points, have retained their position among Cannas, viz., *Indiflora Ehemanni*, the best and most effective green-leaved and Musa-like Canna for planting singly on lawns; *Sénateur Milliand*, the best dark-foliaged variety for the same purpose. *Geoffroy St. Hilaire*, also a fine foliage variety, with a very stately habit, leaves purple-violet. *I. D. Cabos*, a green-leaved variety, with beautiful dark apricot-coloured flowers. *Alphonse Bouvier*, one of the best older varieties for groups, with its rich and effective crimson flowers; it has only one fault, that the trusses of bloom are apt to hang down a little. *Madame Crozy*, also a very good Canna for groups as well as for pot-culture; flowers of a vermilion colour, very delicately bordered with yellow; foliage green; very free-flowering. *Amiral Avellan*, a fine dark foliaged variety, with carmine-orange flowers, and the spikes thrown well above the leaves. *Paolo Radaelli*, foliage green, flowers dark pomegranate-red, bordered yellow. *Ingegnoli Fratelli*, foliage purple-red, with orange-coloured flowers. *Comte de Bouchaud*, with glaucous-green foliage, and extra large canary-yellow flowers, spotted with carmine; one of the best of this class. *Madame Montefiore*, similar to the last, flowers also canary-yellow, spotted brown; it grows tall. *Colibri*, foliage green, with clear yellow-coloured flowers, which have a single carmine spot on the petals. *Amiral Avellan*: this one with green foliage, flowers canary-yellow, and spotted with light red; a pale colour. *Florence C. Vaughan*, similar to *Comte de Bouchaud*, slightly more dwarf in growth, with green foliage, and clear canary-yellow flowers, spotted carmine; very free-flowering. *Charlemagne*, a fine dark-leaved variety, with darker nerves, and flowers of a dark rose; tall. *Doyen F. Liabaud*, a fine extra

large-flowering variety, with green foliage; flowers are citron, spotted brown. *Souvenir du Président Carnot*, has fine, purplish-red foliage, with large flowers of an intense tint of vermilion, and flowers thrown well above the foliage. *P. J. Berckmanns*, foliage bluish-green, and rather tall; flowers of a peculiar shade of violet-rose seldom seen among Cannas. *Souvenir d'Antoine Crozy*, similar to *J. Sallier* file in habit; flowers vermilion, edged with yellow.

Varieties brought out since 1896.—*Czar Alexander III.* is a very fine variety, with bluish-green foliage and large flowers, intense vermilion-red; the plant is very floriferous—it stands rainy weather well. *Hte. Barbercau*, foliage rich green, flowers intense cherry-red, with darker reverse; *Madame H. Rigaud*, foliage green, tinted with brown, and forming fine spikes of dark carmine cherry-red flowers; *Souvenir de Jean Chauré*, a fine variety with intense purple-red flowers of medium size; the foliage is green. *Madame Chabanne* has flowers of a delicate rose, and light green foliage; *Vice-President Luizet*, fine broad green foliage; flowers carmine-crimson-red; *Jean Tissot*, a very effective variety for groups with its dark-green foliage, and its intense carmoisin-red flowers; very free-flowering, and rather extra high in habit; *L. Duport*, also a very floriferous variety, with dark green foliage, and flowers, which are of medium size, of a vermilion-orange colour, lightly edged with yellow; *Aurea*, one of the best yellows, flowers are pure citron yellow, the lower petal slightly dotted.

Mr. Crozy's Novelties for 1897.—The following may be recommended, the others require another year's trial before a definite opinion can be formed of them; *Député Ravarin* with green foliage, and large round flowers of an intense dark grenade purple-red; *Joseph Combet*, a rich velvety carmine, with large flowers and trusses well above the green foliage; *Louis Vorax*, foliage green, and with very large flowers of a pretty light red, tinted orange; *Avant garde*: this is a fine canary yellow, spotted with carmine; the foliage is green—practically, it is an improvement of *Comte de Bouchaud*.

The following were introduced by Mr. W. Pfitzer, Stuttgart, viz., *Kaiser Wilhelm*, a dwarf variety, with scarlet flowers, suitable either for groups or for pot culture, foliage green; this variety has only one defect, in great heat the leaves are apt to roll up, making them unsightly for the time being, unfolding again towards evening, however, without injury; *Germania*, an exceptionally dwarf variety, excellent for pot culture, was much thought of at the Chicago Exhibition; the flowers are of an intense crimson colour, edged and blotched, especially the reverse, with yellow. *Franz Buchner* is, in my opinion, one of the finest Cannas in existence for all purposes, pot culture or the open air, is always good in hot or rainy weather; the foliage is green, and flowers show well above the foliage, they are of a bright orange, tinted lilac, edged slightly with yellow, very free. *Paul Meylan* is somewhat similar in colour, but of taller growth; it is a fine variety. *J. Sallier* file, dark green in foliage, the flowers an intense velvety scarlet, borders blotched with yellow, is an effective variety on account of the great number of its smaller flowers. *Léonard Lille*, leaves bronzy, with darker nerves; flowers of a fine apricot colour, a dwarf variety is very effective. *R. P. Ker*, a tall variety, suitable for the centre of groups, with dark green foliage, edged brown; flowers are large, round, of an intense dark crimson-purple, very effective at a distance; the flower bouquets stand well above the foliage—very free. *Reichskanzler Fürst Hohenlohe*: this is undoubtedly one of the best yellow varieties for groups, standing rainy weather very well; the foliage is green, and flowers are of a very clear citron-yellow, the lower petal only being slightly spotted—a very useful variety. *Captain von Gössel* is a variety useful for pot-culture, on account of its lovely apricot-orange-coloured flowers, slightly tinted gamboge-yellow; the leaves are green.

Pfitzer's New Cannas of 1897-98.—The best of these are *Stadtrath Heidenreich*, fine metallic reddish-brown foliage; flowers of a clear and intense cinnamon-red, are well-formed, and show up snugly in the

bouquets, which stand well above foliage; *J. D. Eisele*, a very good and floriferous variety; foliage dark green; the flowers are nearly round, and are of a clear orange-vermilion—very good for groups; *Hofgärtner Lauche*, very similar in habit to *Germania*, but with flowers of a lighter tint, very floriferous, and capital for pot culture; the flowers are orange-red, spotted and bordered with golden-yellow, and slightly tinted rose; *Mrs. Fr. Eckstein*, a fine dark-leaved variety, with vermilion-orange flowers, standing majestically above the foliage; *Gruss aus Hamburg* this fine Canna has dark green foliage, and clear, salmon-orange-coloured flowers, forming enormous trusses; indeed of such size as at times to droop a little, which is as with *Alphonse Bouvier*, a slight drawback to these otherwise excellent varieties. For groups *Hofgärtner Stiegler*, perhaps one of the best of Pfitzer's 1898 introductions, with dark green foliage, nerved and edged with dark brown; flowers and spikes of bloom are of large size and of a rich carmine-purple, slightly striped, and being also very numerous—this was one of the finest Cannas for groups in the open air last year, notwithstanding the bad weather; it always showed up well; *Hofgärtner-direktor Wendland*, the finest variety of the year: with foliage a rich green, and flowers of an intense velvety dark granite-red, bordered and mottled with canary-yellow; it is very floriferous, and combined with a neat and compact habit, and its intense colouring makes this a great acquisition—seen towards evening in groups, it is not easily forgotten. *Frau Hofgärtnerin Singer* is a fine variety, with medium-sized, pale yellow flowers, almost white, and very free-flowering; foliage dark green, and of compact habit.

The best of Mr. Ernst's introductions consist of *Königin Charlotte*, a fine variety, with green glaucous leaves, and flowers of a rich granite-red, broadly bordered with yellow; a fine variety both for pot-culture and for groups; *Fürst Bismarck*, a fine scarlet flower, of an enormous size; it forms large trusses, and has green foliage bordered with brownish-red. *Gouverneur von Zimmerer*, with shining brown foliage, and large flowers of an intense orange hue, intermixed with dark red; *Goliath*—this Canna is unique, and one of the finest in existence; it should find a place in every collection, especially for pot-culture under glass; the foliage is vigorous and dark green; the large trusses of bloom are very effective, owing to the rich dazzling crimson colour of the flowers; it is a somewhat slow grower, and for this reason is not so suited for the open—the petals are also liable to suffer from great heat. *Princess Pauline*: foliage is dark green, and flowers, which are large and well formed, are of a vigorous cinnamon-scarlet, blotched towards the edge with canary-yellow. The above-enumerated Cannas form a collection difficult to beat anywhere, containing many of the finest varieties in commerce; and I hope that my notes will help to popularise them in England. At the same time I should strongly advise all who come to Germany, especially the middle and south sections, to pay Stuttgart a visit during the summer months, and more especially in August and September. *H. R. IV., Stuttgart.*

HYDRANGEA HORTENSIA FOR MARKET.

Our illustration (fig. 12) represents a group of well-grown plants in pots of the common *Hydrangea Hortensia*, intersected and fringed with a few Ferns for purposes of relief. Messrs. Hill & Co., Wright's Nursery, Lee, Kent, in whose establishment the photograph was taken, are large Fern-cultivators for the trade and for market, besides doing a considerable market trade in such plants as the *Hydrangea*. As most of our readers are probably aware, these *Hydrangeas* are sent to market in 5-inch pots; they are generally about a foot high, and bear a large globular mass of pink flowers, quite out of proportion to size of plant or pot. The cuttings are taken when the plants have flowered, and being grown on coolly during the summer and autumn, make similar plants the following spring. They require a moderately rich, loamy soil.

THE WATER AND BOG-GARDEN.

I SHOULD like to say a few words in praise of this kind of garden, as no other garden is so delightful on a hot summer day as the water-garden. In these gardens we have advantages which some do not possess, that is, a small stream of running water that flows from a spring in the middle of a pond, which keeps the pond always brim-full. At one time the overflow-water was wasted, and ran into the Blackwater. Some few years ago, it occurred to my employer that he would like to make the ditch that carries the overflow look pretty with moisture-loving plants, and this gave me an opportunity that I was

The water in this pond varies in depth from 9 to 20 inches. In the deepest water we planted *Nymphæa chromatella*, *N. odorata gigantea*, *N. o. rosea*, and *Nuphar luteum*, and in the shallower water *Villarsia nymphaeoides*, and have since added *Nymphæa Laydeckeri rosea*, *N. L. lilacea*, *N. L. purpurata*, *N. Marliacea albida*, *N. M. carnea*, *N. pygmæa alba*, *N. odorata sulphurea*, and *N. o. s. grandiflora*. These are all doing well, as the water is shallower and much warmer.

In pond No. 3 the water is still warmer, and the plants in this pond flower remarkably well. The water is much the same depth as in No. 2 pond, but in No. 3 the water is still warmer, from having been

Alisma natans, *Orontium aquaticum*, and *Villarsia reniformis*. *Limncharis* is wintered indoors.

Pond No. 5.—This pond has 1 foot of water and about 18 inches of mud. In this is planted *Richardia æthiopica*, *Butomus umbellatus* (the flowering Rush), *Pontederia cordata*, variegated Rushes, and several sorts of *Sagittarias*, and all these flower well, and seem quite at home. Pond No. 6 has water from 18 to 20 inches deep. In this is planted *Nymphæa Marliacea carnea*, *N. odorata sulphurea grandiflora*, *N. Laydeckeri rosea*, *N. L. lilacea*, *N. L. purpurata*, *N. candida*, *N. odorata rosea*, *N. o. maxima*. On all these we have very fine flowers. The overflow from these ponds is made to form a marshy

FIG. 12.—HYDRANGÆA HORTENSIA : FROM MESSRS. HILL AND CO., WRIGHT'S NURSERY, LEE, KENT. (SEE P. 44.)

very glad to have. A beginning was first made by planting in the pond where the water rises, the common white *Nymphæa alba*, *Aponogeton distachyon*, *Hottonia palustris*, and in clumps round the edge of the pond, the common yellow *Iris pseudo-acorus*, and herbaceous *Spiræas*. Finding these did remarkably well, we determined to make the ditch into five more small ponds of various depths and shapes, and trying all we could not to make them look in any way formal. In the first pond, where the water rises, which we will call No. 1, we tried *Nymphæa odorata rosea*, and a few others which did not flourish; owing to the water springing there, the sun did not warm it sufficiently for the tenderer sorts, the water is also rather deep, 2 to 3 feet. Pond No. 2 is the first overflow from No. 1 pond.

longer in the sun. In this pond is planted *Nymphæa chromatella*, *N. gigantea*, *N. caroliniana*, *N. Laydeckeri rosea*, *N. L. lilacea*, *N. pygmæa helveola*, *N. odorata rosea*, *N. o. Exquisita*, *N. o. sulphurea*, *N. Marliacea albida*, *N. M. carnea*, and *N. Nuphar Kalmianum*. Round the edge is planted *Caltha palustris* in clumps, and in the water are two clumps of *Pontederia cordata* and different sorts of *Sagittarias*. All the plants in this pond flower remarkably well, and have splendid flowers both in size and colour. Pond No. 4 has shallow water round the outside, but in the centre it is about 20 inches. In the centre is *Nymphæa tuberosa*, *N. tuberosa alba*, *N. alba plenissima*, *N. odorata sulphurea*, *N. Marliacea gigantea*, *N. Laydeckeri rosea*, and a fine white seedling. Round the shallow water is planted *Limncharis Humboldti*,

piece of ground, with pools of shallow water. In this we have planted rougher plants; but, although we call them rough plants, they look very beautiful in their season. These plants consist of Bullrushes, water Flags, water Irises, all sorts of herbaceous *Spiræas*, *Fritillarias*, Snowflakes, *Hemerocallis flava*, *Caltha palustris*, *Butomus umbellatus*, *Lythrums*, variegated Rushes, *Saxifraga peltata*, &c.; and in the pools, common *Nymphæas*, *Menyanthes trifoliata*, *Caltha palustris*, *Hottonia palustris*, and *Aponogeton distachyon*. The overflow from this marsh and bog ground is still further made use of, as it runs away down an open ditch; on the bank of this ditch are planted several sorts of *Spiræas*, several sorts of Lilies, and various sorts of spring-flowering bulbs, and here and there a plant of *Gunnera manicata* to

wave its noble leaves over the running water in the ditch. We hope to get Bamboos to do. The surroundings are also made to harmonise with the ponds, &c., by planting in the grass all sorts of flowering bulbs, and many sorts of flowering shrubs. The whole makes a delightful sort of semi-wild garden, and visitors to these gardens always appreciate a look round this part of the garden more than the more formal or trim part of the garden. I would like to add a word of warning to those who are thinking of taking up this style of gardening with a view of saving labour; if you wish for success, you must be at work, or the coarser-growing plants will soon overgrow the more tender and the prettier plants, and the whole thing will become a mass of weeds and rubbish. *William Townsend, Sandhurst Lodge, Wokingham, Berks.*

BELGIUM.

At the Namur Horticultural Exhibition held on June 26, the visitors much admired the Gloxinias sent by M. Kegeljan, the *doyen* of amateur horticulturists in Belgium. For twenty years M. Kegeljan has been trying with keen interest to improve these plants, and he has well succeeded. The flowers are of unusual size, as much as 5 inches across. They are erect, of various colours, some very uncommon in tint. Those that were exhibited at Ghent in April excited much attention.

Another attraction at the Namur Exhibition were the seedling Roses from MM. Soupert & Notting, of Luxembourg, among which was an excellent variety, *Souvenir de Pierre Notting*. This is a hybrid between *Maréchal Niel* and *Maman Cochet*, with large elongated buds and very fine and full flowers, at first yellow, spotted with rose, and then a fine golden yellow. It is a variety of great promise. *E. L.*

THE USE OF ARTIFICIAL MANURES.

In the issue of the *Gardeners' Chronicle* of May 7, p. 274, Dr. Bonavia refers to the use of artificial manures in conjunction with farmyard or stable-manure, and appears to call in question the advisability of this practice. He further seems to doubt my statement that natural manures could be rendered more useful as plant-food if mixed with suitable artificial manures.

The subject is an important one, and we cannot do better than refer to the world-renowned agricultural experiments of Sir John Lawes at Rothamsted for an answer to the question.

As Potatoes are a garden as well as a farm crop, I will quote some results obtained with this crop first. The following table gives the results yielded by the use of farmyard manure alone, or with other manures in addition, compared with results obtained without manure:—

Table I.—Potatoes grown year after year on the same land at Rothamsted. Manures and Produce of Tubers per acre, six years, 1876–81.

	Total tubers per acre.	
	Tons. cwt.	
Unmanured	2	5½
Farmyard manure	5	4½
Dung and superphosphate	5	11½
Dung, superphosphate, and nitrate of soda	7	2½

It will be seen that the average produce of tubers per acre without manure was about 2½ tons, with an annual application of 14 tons of farmyard manure per acre supplying about 200 lb. of nitrogen, there was an average produce over the six years of nearly 5½ tons, that is a gain of 3 tons of tubers for the use of the dung; the addition of superphosphate raised the produce to about 5 tons 12-cwt., an increase of 7 cwt. per acre over the dung alone. By the further addition of nitrate of soda, supplying 86 lb. of nitrogen per acre per annum in a much more readily available condition than those of that in the dung, the annual produce of Potatoes was raised to 7 tons 2 cwt., an increase over the dung alone of more than 37 cwt. of tubers per acre.

The fact is, that it is only the comparatively small proportion of the nitrogen of farmyard or stable manure which is due to the liquid dejections of the animals that is in a readily and rapidly available condition for plants; whilst that due to more or less digested matter passing in the animal fæces is more slowly available, and that in the litter remains a very long time inactive in the soil. Hence the addition of nitrogen as nitrate of soda to the farmyard manure had a very marked effect in the growth of the Potato crop.

The next table refers to Mangolds, and shows in the same form as previously for the Potatoes, the manures applied each year, and the average produce of roots obtained per acre per annum over eight years, 1876–83.

Table II.—Mangold Wurzel grown year after year on the same land at Rothamsted. Manures and Produce of Roots per acre. Eight years, 1876–83.

	Roots per acre.	
	Tons. Cwt.	
Unmanured	4	9
Farmyard manure	15	10
Dung and superphosphate	15	18
Dung, superphosphate, and nitrate of soda	23	10

The figures show that without manure scarcely 4½ tons of Mangold roots were produced, while farmyard manure alone applied at the rate of 14 tons per acre, yielded 15½ tons of roots, and that the addition of superphosphate increased the produce by 3 cwt. per acre. The addition of nitrate of soda supplying 86 lb. of nitrogen per acre to the dung and superphosphate raised the crop to 23½ tons. Showing clearly that when the nitrogen is applied in addition to the farmyard manure in the very easily and rapidly assimilable form of nitrate of soda, the crop of Mangolds is very greatly increased, and that superphosphate of lime is not without effect.

Similar results could be quoted for Sugar-Beet and Swedish Turnips.

It may be mentioned that notwithstanding the large amount of potash supplied in 14 tons of farmyard dung every year, yet in experiments with Mangolds at Rothamsted during the past two years, 1896–97, it was found that the direct application of potash-salts, in addition to the dung, considerably increased the weight of the crop per acre, and greatly tended to its more successful ripening.

In growing Cucumbers and Tomatos for market, it is the custom to apply large quantities of farmyard or stable-manure in making up the beds of soil, and then, during the period of fruiting, to push forward the produce by means of quickly available artificial manures. The same practice holds good in the growth of early Cabbage, and in the cultivation of Asparagus, besides many other crops which could be mentioned.

In regard to the question of denitrification, it may be stated that denitrification, or loss of nitrogenous plant-food, may take place in water-logged soils, and in badly-drained pot-cultures. Also, that an organic manure, which is very effective for plant-growth when applied to the soil in small quantities, becomes positively wasteful and injurious when applied in excess, on account of the insufficiency of available oxygen; a condition of denitrification is thereby set up, and the nitrates are changed back again into nitrites, and dissipated in the elementary form. *J. J. Willis, Harpenden.*

WATER-LILIES AT GUNNERSBURY HOUSE.

THAT the finely-coloured hybrid *Nymphæas* are destined to make a pleasing and novel effect in garden scenery is apparent in the garden at this suburban residence, where the ornamental sheet of water is now made beautiful by a number of large patches of white and coloured Water-lilies. These were planted some years ago by Mr. J. Hudson, and several of them have been illustrated in the *Gardeners' Chronicle* from specimens supplied by him from this collection. The patches measure several yards across. Some of the more effective varieties at the present time are a *Nymphæa* of a crimson tint, with pink outer petals; *N. Marliacea*, and its

varieties *carnea*, *rosea*, and *roseo-punctata*, varying in shades of rose-colour; *chromatella*, pale-yellow, and *Gloriosa*, red; *N. odorata exquisita*, pink; *N. Laydekeri* and *N. L. rosea*; *N. alba rosea*, and other delicately-tinted forms. Of the whites the fine *N. tuberosa* is very vigorous, and has proportionately large flowers. Growing in a tank, sheltered by some plant-houses, are a number of the bright-blue fragrant *Nymphæa stellata*, none of which has as yet been established in the lake.

The beautiful grounds of Gunnersbury House are in excellent order; the extensive vineries and fruit houses, which are the first consideration; show heavy crops of fruit; and the plant-houses include some excellent Orchids, and a very dark *Vanda cœrulea*. *J. O'B.*

AMERICAN NOTES.

WINTER-FORCING OF ASPARAGUS.

SOME very interesting experimental work in the winter-forcing of Asparagus out of doors has been recently reported by Prof. J. C. Whitten, in a *Bulletin* of the Missouri Experiment Station. The method used was about as follows: trenches were made between the rows of a well-established Asparagus plot. These were made 3 or 4 inches deeper than the crowns of the Asparagus plants, and were covered with boards, soil being filled in on top of the latter. A mulch of 3 to 4 inches of horse-manure was spread over the whole. This left a series of small covered tunnels between the rows. In the end of each tunnel a piece of tile was inserted, through which hot steam was conducted by a steam-hose connected with a boiler. The first steam was used November 14. It required about an hour the first day to bring the temperature up to the desired point, 60 degrees. The distribution of the heat throughout the bed was very uniform and satisfactory. After the first day very little steaming was necessary to keep the temperature up to the mark. The first Asparagus was cut November 24, ten days after steam was first applied. Cuttings of Asparagus were made almost daily for about a month. Prof. Whitten thinks that the method of exhausting steam directly into the tunnels is better than carrying it through a closed circuit and return it to the boiler. I will transcribe here the very interesting conclusions from the *Bulletin*:—

“1. Asparagus may be profitably forced in the open field in midwinter in this climate by running steam into shallow tunnels between the Asparagus rows.

2. The steam, coming in direct contact with the soil, readily penetrates it, heating the whole bed uniformly; whereas if the tunnels are heated by inclosed steam or hot-water pipes, the soil becomes too hot and dry close to the tunnels, while it is too cold midway between them.

3. Forcing the steam into the tunnels keeps the soil moist, and maintains more continuous fermentation of the manure-mulch, thus promoting steady heat.

4. The Asparagus produced in this way was larger, of finer quality, and the bed produced longer, than that forced by any other method tried.

5. The plants thus forced recuperate by being allowed to grow one summer without cutting, while Asparagus plants transplanted for forcing are ruined by the process.

6. The amount of soft coal used to force a plot of Asparagus, 25 by 25 feet, in this way, from December 29 to February 25 (58 days), was 2,308 lbs., costing 182 dols., or an average of 39 lbs. daily.

7. During these 58 days steam was turned into the tunnels a total of 16½ hours, equivalent to 17 minutes daily, or less than 3 minutes daily for each tunnel.

8. The forced Asparagus yielded during the 58 days at the rate of 9,882 bunches, or 4,880 pounds per acre.

9. About 5 minutes at a time is as long as steam can be forced into a tunnel without danger of overheating the Asparagus.”

Of course, a method like this must be tried under various circumstances before its general usefulness

be proved; but the suggestion is certainly a very interesting one, and has the appearance of being practicable under a variety of commercial conditions.

"PLUM POCKETS."

A common and serious disease of Plums in all parts of America is the "plum pockets," or "leaf curl," which deforms young twigs, leaves and fruit. They sometimes destroy practically a whole crop of fruit, and usually spoil a large proportion of the leaves. The curls or pockets are caused by various parasitic fungi of the genus *Exoascus*. Our principal knowledge of the *Exoascæ* parasitic on Plums in the United States comes in Atkinson's* excellent contribution. He has found *Exoascæ* of one species and another on every well-known species of Plum in the United States, and also on the Peach and on several species of Cherries. Prof. Sturgis, who found the disease very abundant on Japanese Plums in Connecticut recommends close pruning, burning of diseased branches, and spraying with Bordeaux Mixture. Dr. Erwin F. Smith of the National Department of Agriculture, a recognised authority in vegetable pathology, says that experiments in spraying Peaches with Bordeaux Mixture has proved efficient against leaf-curl. It would probably do equally well with Plums. *F. A. Waugh.*

PLANT NOTES.

LACHENALIAS.

SEVENTY years ago reliable plant catalogues enumerated as many as twenty reputed species of *Lachenalia*, all classed as greenhouse bulbous plants, and natives of South Africa. *L. orchidioides*, a species which dates back to 1752, is probably amongst the oldest, and the genus was named after W. de la Chenal, who was professor of botany at Basle between 1736 and 1800. The forms cultivated in the present day are probably hybrids from *L. pendula* and *L. tricolor*, or varieties of these. That some are busy at work raising new types is seen from the fact that novelties frequently put in an appearance at the meetings of the Royal Horticultural Society at the proper season. *L. quadricolor* is sometimes named as a species, but it is now regarded simply as a synonym of *tricolor*. *L. lucida*, also known as *pallida*, introduced 100 years ago, may also have contributed to the forms grown in the present day.

As August is the month in which many pot their bulbs, a reference to the process may come as a reasonable reminder. In potting, it is a good plan to sort the bulbs, selecting uniformly-sized ones to be potted together, and so secure uniformity in the head of bloom. Four to six bulbs, according to their size, may be placed in a 5-inch pot, and the compost employed made up of two parts of loam, two parts leaf-mould, and one part each of peat, sand, and well-decayed cow-manure, which can be rubbed to something like mould; the bulbs covered to the depth of half-an-inch or so. Though some recommend giving a good watering to settle the soil about the bulbs, the best plan is to use the compost fairly moist, and not give any water until growth sets in, and then sparingly, but more freely as the foliage develops. They can then be placed in a frame near the glass, protected from the least frost, but giving air on all favourable occasions so as to secure a sturdy growth. Cold draughts should be avoided; if they play directly upon the plants, they are apt to injure the foliage. Cool treatment is decidedly the best, provided they can have adequate protection in winter, and the cooler they can be maintained when taken to the greenhouse to bloom the better.

Lachenalias make charming basket plants, the strongest bulbs should be selected for the purpose, and be pretty thickly planted, to ensure a good display.

Some of the prettiest and most effective are *tricolor*, one of the hardiest, the foliage heavily potted with brown, the flowers yellow, green, and

red. *Lutea*, a variety of this, has flowers altogether yellow, and *luteola* is yellow flushed with green, and is an early-flowering form. *L. lucida*, which is found in catalogues under the name of *pallida*, is regarded as a distinct species, novel in character, the flowers pale, almost white with a tinge of blue, and distinct from the species *pallida*. *L. pendula* is one of the earliest to bloom, and also one of the best from a decorative point of view, ruby-red, tipped with deep purple or black. *L. quadricolor* is a rather distinct form of *tricolor*, the yellow ground tinted with green, and marked with deep purple and red. *L. Nelsoni* is a distinct hybrid, and regarded as an improved form of *L. aurea*, the flowers golden yellow, and borne in long racemes.

When the blooming season is over, the pots are placed in the full sun to thoroughly ripen the bulbs, and on the foliage decaying, the bulbs may be shaken out and stored for repotting at the proper time. *R. D.*

COLONIAL NOTES.

TENDER FRUITS FROM CANADA.

Most people learn by experience, and pay a fair price therefor. The Canadian Agricultural Department last year tried the experiment of sending to the mother country samples of the more tender fruits grown in the Dominion—Peaches, Pears, Grapes, Tomatos. The storing and packing of the first lot were not conducive to success; the second experiment was more successful, as was shown by the condition of the fruit on its receipt here. But then came up the cost of picking, packing, storing, carrying, marketing, &c., and it was found that the venture was not quite the success hoped for—the Department was out of pocket. But the experience gained was of such a nature that no doubt is now actually felt as to the ultimate success of the undertaking—that the exportation of Canada's tender fruits to this country will ultimately, and that soon, pay. We can only wish our Canadian friends success, which they will find in careful selection, and an avoidance of glutting the market, when all difficulties have been overcome.

GRAPES FROM THE CAPE.

It will be remembered that during the late season we had to place on record the arrival by every steamer from the Cape of large consignments of wet and spoilt Grapes, the result of packing in a wet condition, or of bad packing, for the other portions of the cargo arrived in very fine condition. The Agricultural Department at Cape Town state that these damaged consignments were the ventures of private persons, and cannot give particulars; at any rate, the facts may be published in the Department's *Journal* as a warning—that is, if the loss already sustained be not found a sufficient deterrent to wrong-doing.

THE VIRGIN ISLANDS.

Far removed as these are from "the madding crowd," there is still sufficient squabbling in Tortola and the minor islands to necessitate the employment among the 5000 inhabitants of some fifty rural police.

Eurcea cubensis and a *Bromeliad*, locally called "Date," grow in profusion everywhere, and the Commissioner feels sure that a fibre-mill worked economically under the personal supervision of the proprietor would give remunerative results. Taking up the manufacture of lime-juice would in the hands of persons of small capital be nothing short of salvation. The Lime-tree flourishes here wherever grown; there is no blight, no lengthened period of drought, nothing but what is eminently suited for it. The natives appear to take no interest in this industry. Fruit-trees bear exceptionally well in these islands, and were a source of income to the community when the Royal Mail depôt was at St. Thomas; but now the withdrawal of steamers to Barbados, and the importation of American fruit to St. Thomas ousts the native producers, and deprives them of a market, their small gains being further reduced by untrustworthy shipowners, who defraud the producer, and take no trouble to prevent the fruit being spoiled.

A steamer touching at the island would remedy this with cheap freight charges. This would enable fruit-growers to ship to more distant markets, where the fruit, being of exceptionally good quality, would probably find a ready sale.

THE FAN-COOLER IN FRUIT-SHIPS.

ALMOST from the time when it was first proposed to bring home from the Colonies their over-production of meat and fruit, the idea of using the fan in forcing a down-draught of fresh air through the cargo in the hold of a ship has been favourably entertained, principally on the score of economy, the low rate of freight, &c. The idea, however, seems to have hung fire; the risks in a test on a large scale had, perhaps, something to do with delay in making the experiment. Of late days, however, it was determined to try the air-fan on a cargo of fruit from the Antipodes—the venture has been made; but if the results are not quite as the sanguine experimenters anticipated, they are not altogether disheartening, and doubtless will be repeated, and with better chances of success. On the present occasion the fan was driven by electricity, and at a critical period in the voyage the mechanism is stated to have broken down; but all the same, a large portion of the fruit-consignment was unloaded in very good condition. This we have on excellent authority as to the *modus operandi*, that will be easily understood—air is forced through the cargo, cooling to some extent as it goes, but in passing back into the atmosphere carrying off the taint of partial decomposition. We can only wish success to this application of the fan, and to the plucky experimenters. *E. C.*

FLORISTS' FLOWERS.

CARNATIONS AT BIRDSALL HALL, YORK.

SOUVENIR de la Malmaison Carnations are so seldom cultivated to perfection, that I am tempted to write a few lines in praise of a magnificent lot I saw at Birdsall Hall, the seat of Lord Middleton, last week. The house they are grown in many would consider quite unsuitable for the successful growing of these lovely flowers, as it is too lofty, and yet Mr. Bailey Wadds year by year has little or no trouble with them, the high state of perfection to which he has succeeded shows what obstacles can be overcome if there is a will to do so. The house, which is 70 feet long, 15 feet wide, and about 20 feet high, is entirely filled with some 500 to 600 plants all in bloom, fifty of which are two-year-old plants, grown in 12-inch pots, and carrying from twenty to thirty flowers; the plants generally are as full of bloom as it is possible for them to be, and yet Mr. Wadds tells me he is continually cutting some for house decorations. The quantities of the four or five varieties he grows are about equally balanced, but some very fine pots of the red variety make a striking picture upon entering the house. There are also a very fine lot of Tree Carnations cultivated for winter-blooming in most of the leading kinds, which, from their present appearance, should make a fine display when their more favoured rivals, the Malmaison, have finished blooming. *F. C. Edwards.*

VEGETABLES.

CARROT CARTER'S LONG FORCING.

This forcing Carrot is one of the most distinct and valuable that we possess, and when better known it is sure to be extensively grown. It is the quickest variety that I know of, makes but very little top, and the quality is excellent. As a Carrot coming into use early in the year, and for exhibition, it is an acquisition.

NEW PEA THOMAS LAXTON.

I was glad to notice in the report of a meeting at the Royal Horticultural Society's garden, published

* Geo. F. Atkinson, "Contribution to the knowledge of the Parasitic *Exoascæ* of the United States," *Bulletin* 78, Cornell Experiment Station (1894).

in last week's *Gardeners' Chronicle*, that an award was made to this fine early Pea. I have grown the variety for the first time this season alongside of several excellent varieties, and am much pleased with it. It is said to be a cross between Gradus and Earliest-of-All, but it greatly resembles Ne Plus Ultra, excepting that the pods are double the size, and so much quicker. With us it is earlier than Gradus, and only a few days behind Earliest-of-All and other earlies. The flavour is excellent, and moreover it is sure to find a prominent place on the exhibition table. I predict for this Pea a great future. Generally speaking, Peas are late, and fill very slowly this season. *E. Beckett.*

[The pods of the new variety sent for our inspection were of moderate size, closely filled with large, square Marrow Peas, of a good green colour, some of them already getting past their best, proving how early it is in turning-in. Provided Thomas Laxton fulfils the requirements of the private and market-gardener in regard to cropping, it is likely to become a popular Pea. *ED.*]

CARROTS.

At one time I preferred the three varieties, Early Nantes, James' Intermediate, and Altrincham Carrots, and I was never disappointed with the first and last-named, although I often was with the Intermediate. Whether it was a particular strain, or the soil did not suit it, or what it was that was at fault I am unable to say, but it grew very coarse, and split to such an extent that I almost ceased to grow it. The Altrincham variety was always very good in quality, and when cooked it was of a nice red colour. It has another recommendable point in the smallness of the core. Early Nantes never failed me. The handsomest Carrot I have ever grown is Veitch's Matchless, which in quality, colour, and shape, is not to be excelled. For the benefit of those who do not know it, I will say that it is of the "intermediate" type, and is indispensable on the exhibition-table. The land for a Carrot crop should be got into a very deep fine state of tilth, and unless this be done if it be heavy soil, there will be many deformed roots. Another matter that demands attention is the early thinning of the plants, which should be done with great care, and if the soil be dry the row should be copiously watered when the thinning is over, in order to wash the soil into the holes made by the withdrawal of roots, and settle the plants that are left for a crop. *H. Markham.*

CAULIFLOWER, VEITCH'S EXTRA EARLY FORCING.

This variety has this year surpassed itself in size, and, if possible, in quality likewise. From seed sown under glass the first week in February, the plants being put out on a south border as soon as ready, I cut heads in the first week of June, and this without any artificial protection being given, and in a cool climate. This speaks well for the earliness of this variety. The circumference of a head, and that not the largest, was found to be 18 inches, which is rather over the average of former years. For several years past we have been enabled to cut heads of this variety before the late Broccolis were over; the last of the latter was cut on June 9. *J. Easter, Nostell Priory Gardens.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Woolverstone Park, Ipswich.

Stove Plants.—Most inmates of the stove are in full growth, and endeavours should be made to keep them free from insect foes. If Thrips, scale, or mealy-bug are present, and these are not promptly dealt with, the plants will be quickly disfigured, and their vitality lowered. The best remedy is to thoroughly clean with a sponge the infested plants with Richards' XL-alkali liquor, or the ordinary paraffin emulsion. Avoid the use of a hard or a pointed instrument when removing the insects from the foliage, much damage often resulting therefrom, but attach a piece of sponge or soft rag to a small label. It is a good practice to dip such plants as can be easily handled and will bear the process without injury, once a week or fortnightly, in a weak solution of either

the above insecticides, which will usually render further measures unnecessary. Affording water, syringing, shading, ventilating, and damping-down are the principal points of stove-management at the present time, and the progress of the plants will largely depend upon these being properly carried out. Much attention must be given to ventilation, the present season being abnormal in the suddenness and extent of the changes of temperature during the day. Rather let the warmth in the house get above the normal than run risks from admitting cold draughts. Carefully guard against a dry air in the house, damping-down frequently, and maintaining a healthy condition by using the apparatus in dull, cool weather, a stuffy stagnant state of the air being adverse to the welfare of the plants.

Chrysanthemums.—The shoots should be tied securely, these being easily broken off by wind. In showery weather do not be misled by the damp appearance of the soil in the pots, but afford water when it is required. As a general rule to be observed, the pots should be rapped or lifted before water is applied to the soil. Some of the stronger-growing varieties require more water than others; and if possible, it should be the duty of one man to look after these plants, as only one such man can properly understand the needs of special varieties. Aphid is sure to infest the young growths, and must be got rid of by dusting with tobacco-powder, or washing with quassia or tobacco-water. In fine weather, damp the plants overhead morning and evening.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Apples.—It will now be an easy matter to distinguish those fruits which will make the best specimens, or which are best for special purposes on bushes, espaliers, &c., and if the trees are too heavily laden with fruit they should be relieved of a good many, one fruit in a cluster sufficing if they are expected to reach the largest size to which the variety can attain. Good colour usually goes with good flavour, and it is essential in dessert fruits, especially in fruits that are to be exhibited. To enable fruits to colour well, direct sunlight must reach them, and the best positions are the strong branches which project beyond the main portion of the crown. At this date much of the young growths arising in the middle of the crown may be removed; but plenty of branches and shoots covered with full-sized leaves must be left till the development of the fruits. Some care is necessary in dealing with trees that have suffered from mildew or insect-enemies, these not being pruned so closely as others which have escaped injury. It is good practice to apply chemical manure in the case of heavily-cropped Apple-trees, or those from which large fruits are desired; and a good mixture for the purpose consists of nitrate of soda one-sixth, muriate of potash one-sixth, superphosphate of lime four-sixths, to be applied to the soil over the roots at the rate of $\frac{1}{2}$ lb. per square yard, that is, as far as the feeding roots extend, lightly forking it in; and over this should be put a thick mulching of half-decayed light manure—not heavy, wet, over-rich stuff, which keeps the air, and consequently the sun's warmth, out of the soil that it is laid upon. In dry weather, water must be afforded copiously once in ten days, using clear water only the first time after the manure mulch is applied, and afterwards manure-water occasionally alternately with clear river, rain, or pond water. Let the land be stirred periodically with the Dutch-hoe, thus keeping down weeds, and preventing the evaporation of the moisture.

Tomatos.—Those plants only that have set fruits heavily should be assisted with a suitable chemical manure, as nitrate of soda, superphosphate of lime, and potash, if the soil be deficient in these, and an occasional application of water in dry weather. Remove all of the lateral shoots, keeping the plants to one stem, and preserving the principal leaves entire as long as they continue healthy, fastening the stems to their supports as they continue to grow in height. In cool or showery weather do not afford manure, as if this be persisted in, the various fungous diseases the plant is liable to are apt to be engendered.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Turnips.—The June sowing will now be ready for singling and hoeing, first chipping the line of plants into small clumps with a draw-hoe, and a few days

afterwards singling the plants 7 to 8 inches apart. In showery weather during this month make another sowing for use in October. This should be a large sowing, as should the weather be free from frosts of severity in the late autumn and early winter, the roots will continue in a usable condition till the New Year.

Spinach.—Frequent sowings should be made of the round-seeded, Monstrous de Giroflay, or Long Stander Spinach, during this month, and a piece of ground prepared for winter Spinach. This should be dug over twice, and well pulverised each time, so that the Spinach moth-grub may be exterminated by the birds; and it should not be heavily manured, or the plants will succumb if the frosts are severe. The position of the piece of land should be warm and sheltered from the east and north, and the sowings may be made now and at the end of the present month, affording a space of 2 feet between the drills, drawing these 1 inch deep.

Cabbage.—It is a matter of importance to sow Cabbage seed for the first early summer-crop next year at the proper time. In the south and warmer parts of the country the end of the month or early in August is soon enough, but in the north generally, and in all late districts, the middle of July is a safe and suitable date. The seed-bed should be on a south or west border in late districts, and in the open quarter in the warmer ones; it should be manured with decayed manure, because something readily available is required by the seedlings, and for the same reason this dressing should not be placed deeper than 3 inches. Having dug the ground, proceed to roughly level it with a rake, then trample it firmly and evenly all over, rake it finely, and it is ready for sowing. The seed may be broadcasted or drilled, and if it be new seed, this should be done thinly. The bed or drills may be covered with siftings from the potting-shed, if the staple be clayey or unkindly. Good varieties to sow twice during this month are Ellam's Early, Sutton's Earliest, Wheeler's Imperial, and Enfield Market.

Parsley.—Seed should be sown in a bed by the side of a walk, in a manner that admits of cold frames being placed over a good breadth in the winter.

Eschallots and Garlic.—When the leaves wither, lift, dry, and store like Onions.

General Work.—Attend to directions given last month in regard to weeding, hoeing, affording water to crops, and the earthing-up of such as require it. Continue to plant vacant ground with Savoys, Borecoles, and Sprouting Broccolis, and set out a few more Leeks if this vegetable is much in demand. Put stakes and broad ties to Cardoons, and see that they do not lack water at the root; similar attention being afforded the stems of Asparagus. Continue to plant out Lettuces, Endive, and make weekly sowings of these plants, and of Radishes and Cresses. In view of the many fungus diseases and insect-pests engendered in refuse of all kinds, the Potato tops, vegetable thinnings, weeds, &c., should be removed to the rubbish heap at short intervals of time, and buried under fermenting dung so as to destroy all germs and eggs as rapidly as possible. Potato-tops affected by *Peronospora infestans* should be charred forthwith. The removal of all such rubbish from the vegetable garden not only renders it tidier, but sweeter and more presentable.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

Grape Vines.—Vines from which the bunches have been removed should be afforded plenty of water at the roots whenever a test shows that the soil is dryish, the Vines being syringed twice or thrice a week; and most of the side-shoots may be allowed to grow unchecked till the end of the season, and the vinery kept cool by affording full ventilation. Those vineries in which the fruit is ripe must also be freely afforded air when the weather is dry, the ventilators being closed in rainy and foggy weather, at which times allow a slight degree of warmth in the heating apparatus. Of course the gardener who has ripe Grapes hanging on his Vines must exclude wasps from his vinery, or there will be much loss of fruit. Thin canvas, hexagon netting, scrim, &c., may be used, securely tacking it over all openings, including the doorways. The borders of all the late vineries will, if in good order and efficiently drained, require an occasional thorough application of water. It is a prudent course to examine a Vine-border once a week, water being

afforded to such as are merely moist, and occasional manure-water. The damping of the vineries must be in accord with the prevailing weather, four times being not too often on bright days, and once or twice on sunless days, and scarcely at all in wet weather. When the colouring of the fruit begins, less and less moisture is required in the air, and damping down must cease altogether at the final stage. The stopping of side-shoots must still be followed up, not however doing this by fits and starts, or the cracking of the berries may occur, which is also due to other causes, as for example letting the border get very dry and then affording large quantities of water; keeping the vinery close when colouring begins, is also conducive to this malady. The Madresfield Court Grape is a variety mostly liable to have split berries, and the best means to prevent splitting is to maintain a little more heat in the heating apparatus at the period when the variety is most liable to split, namely, when colour first shows in the fruit. This additional artificial heat should not be afforded at those times when the sun may happen to be shining warmly, but earlier and later in the day. The ventilation should be fairly good, but not excessive, and it should be constant, the upper lights only being closed to keep out the rain. The removal of laterals should cease when this variety begins to put on colour. As a rule of general application, the vinery in which are Grapes beginning to colour should not be closed entirely, but air afforded at the top of the house always, and in warm weather this may be supplemented by a little in the front. Let the thermometer stand at 70° at dusk, and fall to 65° at day-break; on dull days 70° to 75° will be high enough, and 80° to 85° if the sun shines brightly. Afford air in the forenoon at 70°, increasing it in amount at 75°, and again at 80°, and allow the warmth then to rise 5° more. Commence to reduce the amount of air as the warmth declines, and close at 3 P.M.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Cypripedium caudatum and other species.—This most attractive and curious species is but seldom seen in a healthy, vigorous condition. The principal causes of this is a too high temperature, and insufficient ventilation. The best position for the plant is on the north side of the intermediate-house, where it will get plenty of fresh air, and a suitable light. If the plants require additional pot-room this season, the work should be done at once, and if healthy, they will require pots at least two sizes larger than they at present occupy. Fill the pots one-third full of drainage material, and cover this with a thin layer of sphagnum-moss. Peat and moss in equal parts, mixed, and a few broken crocks, form suitable compost, and a few nodules of tufa-stone may be used with the soil. Prick in a few living heads of sphagnum over the surface of the compost. In the case of unhealthy plants, turn them out of the pots, and remove the old soil, then cut off all dead roots, and repot the plants in pots just large enough to hold them, using a little of the same compost as for the stronger specimens. After repotting, keep the soil just moist, and when the plants have commenced to grow freely, frequent waterings will be necessary. *Uropedium Lindenii* is very similar in growth to this *Cypripedium*, and should be treated in the same way. *C. Schlumi*, *C. Dominianum*, *C. albo-purpureum*, *C. Juno*, *C. vexillarium*, *C. Arthurianum*, *C. Statterianum*, *C. Fairieanum*, *C. Mastersianum*, *C. H. Ballantine*, and *C. radiosum*, should all be grown in a shady corner of the same house. They are now growing freely, and require liberal waterings.

Celogyne cristata and its varieties, require plenty of water at the root at this season, but the soil must not be kept in a saturated condition. Several large specimens here are afforded a soaking about once a week, and those in smaller pots more frequently. A slight dewing overhead at closing time will assist the plants to make strong pseudo-bulbs. The pretty and distinct *C. Veitchiana* thrives best when suspended from the roof in small shallow pans, and only a very thin layer of peat and sphagnum-moss. Since the completion of growth, water has been afforded sparingly, but now that the plant is producing its pendulous flower-spikes, more water will be needed.

Milvonia.—Plants of *M. spectabilis*, *M. Moreliana*, *M. Lubbersiana*, and others of that section that are showing their flower-spikes should be given as much light as possible without direct sunlight, and plenty of root moisture is needed until the new growths are completed. *M. Schroderiana* now sending up its

flower-spikes, is a rare and handsome species requiring a moist shady position in the Cattleya or intermediate-house.

Cymbidiums.—Abundance of water should now be afforded to strong well-rooted plants of *C. Lowianum*, *C. eburneum*, *C. Devonianum*, *C. chloranthum*, *C. Tracyanum*, *C. elegans*, *C. Mastersii*, *C. Lowioeburneum*, *C. eburneo-Lowianum*, *C. Hookerianum*, &c., but such plants that have been recently repotted will need care. *Cymbidiums* grow well in a shady part of the intermediate-house, *Odontoglossum*-house, or cool Fernery.

The Cool-house.—Such plants as *Laelia pumila*, *L. præstans*, *L. Dayana*, and *Cattleya marginata*, are just commencing to grow. If a suitable position can be found for them in this house where they can obtain plenty of light, they may remain there until the autumn, but where the *Odontoglossums* are heavily shaded it will be advisable to remove these species to a cool part of the intermediate-house. From the present time *Laelia pumila*, &c., will require to be kept moist at the root until the new growths are made up. The plants may be afforded fresh rooting material as soon as new roots appear at the base of the current season's growth; they are best cultivated in shallow pans that can be suspended close to the roof-glass. Such thin-bulbed species as *Laelia Dormaniana*, *L. harpophylla* and *Cattleya bicolor* should be elevated well up to the light in the Cattleya-house. *Laelia Lindleyana* thrives best when suspended in a light position in an intermediate temperature. *Dendrobium Kingianum*, *D. teretifolium*, and *D. linguiforme* should be suspended in the cool-house where they will get plenty of light. During growth these species require to be kept thoroughly moist, and while at rest moderately dry at the root. Keep the *Lycastes* well shaded from all sunshine, and damp frequently between the pots. Avoid letting water lodge in the centres of the young growths.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord Gerrard, Eastwell Park, Ashford.

Deutzia crenata flore plena.—As a middle or front row plant in the shrubbery, this species of *Deutzia* is a suitable and proper kind of sub-shrub, flowering in summer, and in good soil and sunny situations being literally covered with flowers, which are white, and as its name implies double, which under bright sunlight gradually become at the base of a pinkish hue. It makes a pretty solitary or group plant on the lawn, and it is perfectly hardy. The pruning should be performed as soon as the flush of flowering is passed. In old specimens, if the weak flowerless wood be cut out, and the strongest shoots cut back to half their length or less, or not at all, as fancy may dictate, long graceful shoots are made the same year, which form perfect wreaths of blossoms the next year. Young plants till they are well furnished with shoots, require their best shoots to be cut back rather severely for a few years. It likes a soil well drained, and fairly good; if peat and loam be mixed with the staple, root and top growth are assisted.

Philadelphus coronarius and others.—These are handsome summer-flowering shrubs, of which the common Mock Orange is a type. *P. coronarius* is rather tall in growth, and is a plant that should have plenty of room for full development; whilst the others, like *P. microphyllus*, are smaller, and more compact of habit, making pretty miniature trees if grown or worked on 3 to 4 feet high stems.

Hydrangea paniculata alba.—This is another useful summer-flowering shrub for the front rows of shrubberies, or for planting in large beds. The plant revels in a good soil, and when plenty of manure has been afforded, the flowers come very large. They are borne in panicles at the ends of the shoots. It is very effective when used as a dot-plant, or for the centres of large beds, or when intermingled with scarlet zonal Pelargoniums. Some other useful varieties are *Thomas Hogg*, and *H. grandiflora*, *H. japonica stellata*, and *H. japonica Mariessii*.

Hypericum.—For the covering of banks, and planting in dry places under the shade of trees, for forming ornamental coverts, and the front rows of clumps and shrubberies, *H. calycinum*, or *St. John's Wort*, is probably one of the best summer-flowering subjects. The colour of the flower is yellow, as it is in all the species, of which there are many. Some are of a small, and others of a large growth, and some attain a height of 4 feet. They mostly flower throughout the summer. A minia-

ture variety of recent introduction, whose height is about 6 inches, which I saw in the Coombe Wood Nursery of Messrs. J. Veitch & Sons recently, should be useful as a permanent edging plant.

Rose York and Lancaster.—For a continuity of bloom and varied tint, this is a very effective, single-flowered Rose. The plants do best when pruned somewhat hard, and generally it is of easy culture, and quite indifferent as to soil, although naturally thriving best in good loam.

THE APIARY.

By EXPERT.

How to commence Bee-keeping.—There are many things in bee-keeping which may be considered of importance; the beginner should understand all of these if he or she would be successful, hence no one should enter the ranks of bee-keepers without first reading some of the many good works on bee-keeping. There are more good books on this subject than can be named here. Having procured one of these books, carefully read it two or three times, till the whole is familiar to you from beginning to end, when you will be ready to subscribe for and read intelligently one or more of the several good bee-keeper's journals there are published here and in the United States. Having got so far, I will tell you one of the many other things you will need to know, for on this hangs very much of that which will bring prosperity. In nearly all localities where bees can be kept, there are certain plants and trees which give a yield of surplus honey at a certain time of year, while, aside from this, there is little more honey obtained by the bees than is needed to supply their daily wants. Some localities give a surplus at three stated periods, others at two, while the majority give only one such yield. Hence, it must be apparent to all, that if such a honey-yield (or yields) passes by without any surplus, none can be obtained during the season. From this it will be seen that in order to be a successful apiarist, a person must have a knowledge of his locality, and also know how to secure the labourers (bees) at the right time, so they can be on hand when the honey-harvest is at its best. Failing to do this, there is little or no profit in apiculture, and my main reason for writing on this subject is that those who read may obtain the best results from their bees. Practically first, then, we have the location. In Central New York, says an American writer, the honey-crop comes mainly from Linden or Basswood, which blooms from July 2 to 15, and lasts from ten days to three weeks, according to the weather. In other localities in this State, White Clover is the main crop, coming in bloom from June 10 to 16, and again, in others, Buckwheat, yielding honey in August; but as the larger part of those living in the Northern States have a yield of honey from Basswood, I will speak of that as the harvest in illustrating what I wish to. Bear in mind, however, that it devolves on the reader of this to ascertain by careful watching just when and what is the source of his surplus honey, so as to work accordingly. After having determined when we may expect our harvest of honey, the next step is to secure the bees in just the right time for that harvest. If you have a field of grain to cut, you hire the labourers when the grain is ripe—not before or afterward; yet in keeping bees, hundreds pay no attention to the matter of securing labourers, so that as a rule they are generally produced so as to become consumers rather than producers, and for this reason we often hear persons exclaiming that bee-keeping does not pay. The queen is the mother of all the bees in a colony, she laying all the eggs producing them. Under the greatest stimulation she is capable of laying from 3000 to 4000 eggs a day, yet often she is laying only from 500 to 1000 eggs daily at the time she should be doing her best. After the egg is laid, it takes three days for it to hatch into a little larva. This larva is fed six days, during which time it has grown so as to fill the cell, when it is capped over, and remains hid from view for twelve more days, when it emerges a perfect bee. This bee now works inside of the hive for sixteen days more, when the colony is in a normal condition, doing such work as feeding the larvae, building comb, evaporating nectar, &c., when it is ready to go outside as a field-labourer, and at forty-five days, during the working season, from the time of hatching, it dies of old age, and another generation takes its place. From the above, it will be seen that the egg must be laid at least thirty-seven days before the honey-harvest, in order that our bees have the opportunity of labouring in that harvest to the best advantage.

(To be continued.)

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 16	New Brighton Rose and Horticultural Show.
WEDNESDAY, JULY 20	Cardiff and County Horticultural Society's Show (8 days).
THURSDAY, JULY 21	Sidcup Rose Show.
SATURDAY, JULY 22	Royal Botanic Society, General Meeting.

SALES.

WEDNESDAY, JULY 20	Clearance Sale of 40 Greenhouses, Piping, and the whole of the Plants, at the Nurseries, High Road, Tottenham, by order of the Executors of Mr. George Beckwith, by Protheroe & Morris.
FRIDAY, JULY 22	Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63° 4'.

ACTUAL TEMPERATURES:—

LONDON.—July 18 (8 P.M.): Max., 68°; Min., 54°.
 PROVINCES.—July 18 (6 P.M.): Max., 70°; South-west Counties; Min., 50°; Sumburgh Head.
 Fine, warm.

Cyanide of Potassium as an Insecticide. Experiments of an extensive and exhaustive nature have been carried on in recent years under Government direction in the United States of America, with the view of discovering a cheap and effective insecticide, which ordinary people might use with ease and certainty for the destruction of noxious insects in greenhouses and similar glass structures in which plants are cultivated. Among numerous other ingredients fatal to insect-life which have been experimented with on a large scale, and carefully tested on all kinds of plants grown in glass structures, the cyanide of potassium has been found to approach nearest to the standard aimed at—cheapness and efficiency, facility of application, and certainty in its results—when used in accordance with a few simple conditions. The fumes of cyanide of potassium in a diluted state, are well known to be one of the most effective agents that can be employed for the destruction of the common wasp, *Vespa vulgaris*. A few drops of the diluted solution on a small bit of soft woollen rag, or a little cotton-wool, or wadding, carefully inserted in the mouth of a wasp's nest, leaving room for the wasps to pass out and in over it, is fatal to all the wasps that come within the influence of the deadly fumes of the potassium. Most gardeners and fruit-growers are aware of this valuable property of the cyanide of potassium, and although it is a deadly poison and must always be handled with the greatest caution, they have learned to use it with freedom and safety in the open air for the destruction of that great enemy to the British fruit-grower, the common wasp. Its use as a general insecticide inside of glass structures has not hitherto been in vogue in this country, but the success which has attended its use in the United States fully warrants an exhaustive trial of its merits in our plant-stoves and greenhouses.

The following particulars about the insecticide and the method of using it are by a skilful gardener in charge of an extensive garden and ranges of glasshouses in the valley of the Hudson, in the State of New York, who vouches for its success and economy, after using it solely for clearing his houses of insect-pests for the past eighteen months:—

"Having in readiness a quantity of cyanide of potassium and sulphuric acid, sufficient of each for the operations in hand, a number of stone-ware jars, and a kettle of hot-water, the work is carried on as follows: Pour first about a pint of boiling hot-water into a jar, and then add 1½ pint of sulphuric acid, and let the mixture stand till it begins to boil rapidly, which it will

do in a minute or so. The cyanide of potassium is then added, in the proportion of one and eight-tenths of a grain to every cubic foot of free-space contained in the house to be operated upon. In calculating the free-space in the house (or the cubic feet of air contained in it), allowance must be made for all staging, heating-apparatus, pots, soil, and bulky plants, &c., so as to get at the exact number of cubic feet of air, or free-space, which the fumes have to fill. The proper quantity of the cyanide to fill this space should be placed in a thin but strong paper-bag, or bags, if the house is large; and the bag, or bags, should be no larger than is necessary, although for safety a second paper-bag may be used over the first one. A few eyelets or hooks should be inserted in the woodwork of the roof to carry a string from the door to immediately over the jar in which the mixture of water and sulphuric acid is boiling, and one of the small bags of cyanide is fastened to the end of the string and suspended a few inches above the boiling liquid in the jar, the other end of the string being securely tied outside the door. The house now must be closely shut up, and every person being outside of it, the operator unties the string, and allows the bag of cyanide to drop into the jar of boiling liquid, which quickly destroys the paper-bag and disperses the cyanide in fumes to every corner and cranny of the house. The operator, after releasing the string and dropping the bag into the jar, should, for safety from any fumes which may escape through a hole or crevice in the house or door, stand back a few paces until the cyanide has performed its deadly work. In exactly twenty-five minutes from the time the bag was dropped, by which time the fumes will have found their way into every hole and corner where an insect may be hiding, and killed it, the doors and ventilators, and all sliding sashes, should be thrown wide open, so as to allow the foul air to escape as quickly as possible, the operator being very careful not to breathe it, else consequences may be serious. In about twenty minutes, or at most half-an-hour, according to the amount of ventilation that is given, the house will be safe to enter; but it is obvious that in dealing with such a poisonous gas one cannot be too careful in running any risk that can be avoided. No person should venture into the house while there are any of the fumes in it, as they will kill almost any animal in a few seconds, and man is as easily affected by them as any of the lower animals. In fact, they will kill every living thing that breathes, and hence their value in exterminating insects, of which none will be found alive after the house has been fumigated in the manner described with the cyanide of potassium.

All damp must be driven out of the house, and the plants should be quite dry in their foliage before commencing to fumigate them with the cyanide, because if there is any moisture on the leaves and young growths, they are liable to get scorched. All being dry and in good order, the process may be carried out with perfect safety to the plants; and houses full of Palms, Ferns, Roses, Violets, Carnations, and other tender plants and flowers, have been treated as described during the past winter and spring with the most successful results, the insects being completely destroyed and neither a flower nor a leaf hurt in the least.

The cyanide should be as pure as possible, and of course handled with the greatest care to prevent any accident; in short, it should be treated exactly the same as all poisons must be

treated according to law, and there is then no danger in using such a valuable insecticide. The amount of water and sulphuric acid to be put into a jar varies with the size of the house, which regulates the amount of cyanide to be used. The water must always be first placed in the bottom of the jar, and the proportion of water to sulphuric acid is always the same—two parts of water to three parts of acid—and the quantity of that mixture in the jar should be just sufficient to completely submerge the bag of cyanide when dropped into it. The operator must also be sure the liquid is boiling before the bag is dropped. If it is not boiling rapidly, pour in a little more sulphuric acid, but be careful not to overdo it, which would waste the materials and do more harm than good. Should large or long houses require to be fumigated, the number of jars can be increased to the needful extent, distributing them evenly throughout the house, and taking the strings out through the ventilators, or a small hole bored in the woodwork for the purpose. In fact, there is no structure for growing plants in which this insecticide cannot be applied; but while that is the case, it should never be used in conservatories or plant-houses attached to a mansion, or dwelling-house, where there is a possibility of the noxious gas finding its way into the rooms. With due caution, and careful manipulation, the cyanide of potassium may prove a great boon to the horticulturist."

THE PLEASURE-GROUND AT EAST BURNHAM BEECHES.—Our illustration (fig. 13, p. 51), shows a view in the gardens at Mr. H. J. VEITCH'S residence, East Burnham. That the owner should, after his long and varied experience in horticulture, leave the beaten track in the laying-out of his own garden, and show his sympathy with the natural method in preference to the formal and symmetrical, is perhaps no more than we should expect. This style appeals to most of us, and especially to those who have looked for a long course of years on what is, after all, the architect's garden, the garden in which the plumet, the theodolite, and measuring-rod dominate every feature to the exclusion of the natural, excepting when in leading strings. The trees seen in the picture were, of course, existing there when Mr. VEITCH bought the place, and in this part he has been satisfied to merely supply the embroidery to the clumps and belts of them, and furnish a pool of irregular outline in the dark nook for the sake of affording variety and as a home for a few aquatics, including *Marliac's Water-Lilies*. It would appear that a ditch bisects the turf, as is suggested by the clumps of rushes, the giant *Heracleum*, the *Epimedium*, *Spiræas*, and other moisture-loving plants bordering the sides. Doubtless the lovely Japan *Iris* find a suitable home hereabouts. The white-flowered mats seen at the angle of the clump on the right-hand consists of *Crambe cordifolia*, a hardy herbaceous perennial from the northern Caucasus mountains, and growing to a height of six feet. Those who know their hardy herbaceous perennial plants well will have no difficulty in suggesting a number of them suitable for adding the charms of habit, leaf, and flower to the scene depicted.

BOTANICAL MAGAZINE.—The July number contains coloured figures and descriptions of the following plants:—

Cologyne Swainiana, Rolfe.—A native of the Philippine Islands, closely related to *C. Dayana*, but the present plant is smaller, the sepals and petals are not reflexed at the margins; t. 7602.

Callicanthemum rutæfolium var. *anemonoides*.—An herbaceous plant, with tufts of palmately divided foliage, long peduncles bearing single flowers at their extremity, each about 1½ inch broad. The construction of the flower is similar to that of an *Hepatica*; t. 7603.

Iris Grant-Duffi.—A yellow-flowered, rhizomatous species, whose falls are pencilled with purple streaks, and whose disc is marked with an orange-coloured central blotch. Native of Palestine; t. 7604.

Eria latibracteata.—The plant forms a chain of rounded pseudo-bulbs, from the sides of which emerge the flower-spikes, with numerous yellowish flowers. Native of Borneo; t. 7605.

Calochortus clavatus.—One of the handsomest garden forms, having large deep yellow flowers. It was introduced by Mr. CARL PURDY, and flowered in the open border at Kew in June; t. 7606.

PUBLIC GARDENS AND THE STUDY OF BOTANY.
A letter was received by the London School

THE BOARD OF AGRICULTURE has issued a series of leaflets relating to insects injurious to plants, such as the fruit-tree beetle, *Scolytus rugulosus*; the eel-worm, *Tylenchus devastatrix*; the red-spider, *Tetranychus telarius*; the Asparagus-beetle, *Oriocera asparagi*; the Pea-thrips, *Thrips pisivora*. Copies of these leaflets may be had free of charge, and post-free on application to the Secretary, Board of Agriculture, 4, Whitehall Place, S.W. Applications need not be stamped.

"BIBLIOTHEQUE D'HORTICULTURE ET DE JARDINAGE."—Three volumes of this series (Paris: OCTAVE DOIN, et Librairie Agricole) are now before us, and may be spoken of together. All are useful

CHRYSANTHEMUMS.—We have received a copy of the memoirs read at the Chrysanthemum Congress at Lyon, including one on the "Diseases and Parasites of the Chrysanthemum," by M. CHIFFLOT; on the "Fertilisation of the Chrysanthemum," by M. GERARD; and on the "Best Manures and Composts," by M. FATGER. These papers are in the French language, and may be had of M. OCTAVE DOIN, 8, Place de l'Odéon, Paris.

AMERICAN AGRICULTURE.—M. P. DE VUYST has published *A Comprehensive Review of the State of Agriculture in the United States*. It may be had from OCTAVE DOIN, Place de l'Odéon, Paris.

FIG. 13.—VIEW IN THE GARDENS, EAST BURNHAM PARK, SLOUGH. (SEE P. 50.)

Board from the London County Council, stating that the Parks and Open Spaces Committee had considered the Board's letter of May 24 last, which enclosed an extract from a report from the British Embassy at Berlin, as to the arrangements in force in that city for facilitating the study of botany, and which asked the Council whether a somewhat similar arrangement could not be made in London. The County Council informed the Board that they were taking steps in this direction by forming a series of beds in Battersea, Ravenscourt, and Victoria Parks, with specimens of plants in their natural orders, and added that the Parks Committee thought that it would be desirable to see the result of this experiment before proceeding any further for the present. We commend to the Boards concerned the perusal of the article on town botanic gardens in our last issue.

handbooks, illustrated and well arranged. M. JULES RUDOLPH is the author of the treatise devoted to *Caladium, Anthurium, Alocasia, et autres Aroidées de Serre*; MM. G. BOUCHER and S. MOTIET write on *Les Clématites, Chèvrefeuilles (Honeysuckles), Bignonées, Glycines, Aristoloches, and Passiflores*; and M. ALB. LARBATÉRIER publishes his *Essais Pratiques de Chimie Horticole*.

THE FLORIDA VELVET BEAN.—We had occasion to refer to this in a preceding number. We now have to make mention of an article with an illustration in the *Queensland Agricultural Journal* for May last. The plant is named as *Mucuna pruriens* var. *utilis*, and it is thought it may prove a valuable fodder plant in warm climates, and useful for green manuring.

BOTANICAL NOMENCLATURE.—Our botanical works are praying for some new ADAM to arrive who will give names to flowers that everyone will recognise. In regard to the scientific names, they thought they had it "down fine" when, in the time of LINNÆUS, they established a set of canons which every orthodox botanist, it was supposed, would obey. After a century of trial, it was found the laws agreed upon had not been observed. There has become a revolt, and a sort of go-as-you-please practice is prevailing. One author issues a book with one set of names, another a book with a different set of names for the same plants. One man's herbarium is arranged under the names adopted by one shining light; when the other starts to examine his friend's collection, he finds it "all Greek" to him. In a spirit of desperation some of the leading botanical publications are giving

prominence to what they term common names; but before the text has been hardly published, the common name is found to be uncommonly uncommon. Few know what the others are talking about. Babel rules, and a second ADAM is prayed for. *New York Independent*, June 25.

FLOWER AND FRUIT-FARMING IN ENGLAND.

—Mr. W. E. BEAR contributes to the *Journal of the Royal Agricultural Society of England* an elaborate article on the culture of flowers for market, giving special prominence to the Narcissus culture in the Scilly Islands. A great deal of similar information to that here given has been published at intervals in our columns, but those interested will be thankful to have the information in a separate form. Here is an extract which should be noted by our statesmen:—"The freight per cwt. from St. Mary's to London, 350 miles, is 8s., while 6s. to 7s. is charged for conveyance of similar goods from the South of France, 700 to 800 miles. From the Channel Isles the charge is 4s. per cwt.

CYCLAMEN LATIFOLIUM IN NORTH AFRICA.

—Professor WRIGHT, in the last number of the *Notes from the Botanical School of Trinity College, Dublin*, mentions the discovery, in 1895, on a hill called Djebel Bon Kournein, of *C. latifolium*, Sibthorp. It appears that *C. punicum* of Poir. is a synonym referred to the same species. Messrs. BONNET and BARRATTE, in their *Catalogue Raisonné des Plantes Vasculaires de la Tunisie* (1896), allude to the presence of the plant in other localities near Tunis. Professor WRIGHT adopts the generic spelling *Cyclaminus*, and the specific name *Persica*. The *Kew Index* has *Cyclamen latifolium*, and this is the name that is most convenient for gardeners to follow.

PROFESSOR FOSTER.—An excellent portrait of this eminent gardener and distinguished man of science is given in the *Garden* for July 2.

WHEAT PROSPECTS IN THE UNITED STATES.

—It will be interesting at this period to note that, according to latest reports, the average condition of spring Wheat is the almost, if not entirely unprecedented one of 100·9, as compared with 89·6 on June 1, 1897, and a June average of 92·5 for the past ten years of the twenty-four States reporting on the condition of spring Wheat. Six report a full normal crop, and eleven a condition indicating from one to fourteen per cent. above the normal. As to winter Wheat the average condition is 90·8, as compared with 78·5 at the corresponding date last year, and 81·6—the average for the last ten years.

A NEW CARNATION.—The excellent white-flowering Carnation mentioned by our correspondent on p. 36 of our last issue, in his report of the meeting of the Scottish Horticultural Association, as "Netheridge," is to be known as Mrs. W. Buckler Lethbridge. Mr. LETHBRIDGE, of Riverdene, Cookham, Berks, who exhibited the variety in Scotland, was awarded a First-class Certificate by the above-named Society.

REDHILL, REIGATE AND DISTRICT CARNATION AND PICOTEE SOCIETY.—We are requested by the Hon. Secretary of the above to state that, owing to the postponement of the National Carnation Society's show, this show is also postponed to the 29th inst. The tickets already sent out hold good for that date.

CELLULOSE LABELS.—Mr. DOUGLAS ALLPORT, 108, Queen Victoria Street, E.C., sends us samples of a label which is neat and serviceable. "It is practically as permanent and as dirt-proof as porcelain. It is much handier to fix, and has the great advantage of always remaining in a readable position." We commend them to the notice of amateurs for their neatness. It is as well to remind them that they are very inflammable. Apply a match to them, and they are consumed almost immediately, and so perfectly that little or no ash remains. The labels can be attached to a stick or to the plant itself.

STOCK-TAKING: JUNE.—Considering how very much the Spanish-American war interferes with trade all round—and with that of this country in par-

ticular—the Trade Returns for the past month are not so unsatisfactory as might have been expected. The enhanced value of bread-stuffs keeps up the value of imports; exports of machinery and millwork have gone up in value and quantity, showing, or serving to show how much the engineers' strike of last year meant to the people of this country; but it will be a long time before increased output will have recouped us for our losses of last year. The value of the imports in June was £39,032,305—in June of 1897 it was £36,321,809, showing an increase of £2,710,496—the increased value of food being £2,317,109; dutiable articles fell away by £29,123. Apart from the tabular record, the other items showing an increase are metals, £113,401; chemicals, &c., £77,881; oils, £115,047; and manufactured articles, £579,386. The "summary" table yields the following additional (and usual) information:—

IMPORTS.	1897.	1898.	Difference.
Total value ...	£ 36,321,809	£ 39,032,305	+ 2,710,496
(A.) Articles of food and drink—duty free ...	12,879,583	15,196,692	+ 2,317,109
(B.) Articles of food and drink—dutiable ...	1,754,745	1,725,622	— 29,123
Raw materials for textile manufactures ...	4,498,012	4,889,464	+ 391,452
Raw materials for sundry industries and manufactures ...	5,025,197	4,487,625	— 537,572
(A.) Miscellaneous articles ...	1,044,379	976,990	— 67,389
(B.) Parcel Post ...	49,998	127,484	+ 77,486

While the value of bacon from America and Canada was increased by £137,000, lard and beef went up £132,280 and £122,415 respectively, Coffee to the value of £83,991, Cocoa rising some £20,164; and Tea and Tobacco falling off, the former by £97,971, and the latter £86,855. The value of cotton imports went up £700,554, and Hemp (mostly from the Philippines) £126,000. Wool fell off by £403,000. The increase in the value of manufactured articles is contributed by cotton, leather, silk, and iron goods. The figures for the six months show an increase of £10,750,505—thus, June, 1897, £225,245,246; June, 1898, £235,995,751. Here we make our usual statement respecting the imports of fruit, roots, and vegetables:—

IMPORTS.	1897.	1898.	Difference.
Fruits, raw:—			
Applesbush.	66,669	17,241	— 49,428
Cherries	158,056	166,012	+ 7,956
Plums	14,773	9,541	— 5,230
Pears	52	4	— 48
Grapes	4,469	5,018	+ 549
Unenumerated	189,886	220,526	+ 30,640
Onions	221,821	383,746	+ 166,922
Potatoescwt.	1,138,938	1,533,374	+ 394,436
Vegetables, raw, unenumeratedvalue	£208,171	£233,972	+ £25,801

It is worth noting here that our Canadian friends purpose sending us their spare tender fruits, for which we have room; as witness the fact that 30,000 boxes of Strawberries arrived the other day from France, which a very few hours sufficed to dispose of. This large arrival of fruit had no lowering effect on the market. There is a large increase in the quantity of Potatoes received from the Channel Islands. Those who may have Apples to sell will reap a well-deserved and unusual profit. Our American reports are to the effect that the prospects for Peaches are very fine indeed, and the same may be said for those of the Apple crop in many of the States. Turn we now to the

EXPORTS.

under which heading we find an increase amounting to £323,699—obtained thus:—June, 1897, £19,089,997; June, 1898, £19,413,696. After a series of deficits, it is gratifying to make this record. The chief improvement is found in machinery and millwork, also in steam-engines and agricultural and

textile machinery sent to various parts of the globe. As might be expected, the exports of mining machinery have not improved much. By the way, coal fell by 165,000 tons, but the value increased by £81,239. We exported beer and spirits about £48,000, in excess of the amount for June, 1897; and the value of manures went up £51,000. Bicycles fell away by some £42,354. Cotton goods, mainly to the Far East, went up £291,272; but woollen and worsted goods gave way £361,774. Our Irish manufacturing friends have once more a deficit to meet, linen manufactures having fallen off by £213,997. The buyers in America have decreased their demands to the amount recorded here. We have only to note in conclusion that the exports for the six months show a reduction of £1,902,273.

THE NEWCASTLE SHOW.—The Royal Horticultural Society, who in 1896 visited by deputation the York Floral Fête and the Chester Floral Fête, and last year the Shrewsbury Show of the Shropshire Horticultural Society, have this year selected one provincial centre only to thus officially visit, namely, Newcastle. It is to be hoped that the active patronage thus extended to the exhibition of the Durham, Northumberland, and Newcastle Botanical and Horticultural Society, will have the effect of contributing to the removal of the slight financial embarrassments from which it has suffered several years. This would be the more gratifying, because the Society has been so long established, its incorporation having taken place in 1824. Since that time it has done much to encourage horticultural pursuits, and now deserves the support it needs to strengthen it for future work. Many a fine exhibition has been held at Newcastle under its auspices, and we trust that better ones will have still to be held.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.

—The following letter has been forwarded to the Right Honourable W. H. LONG, M.P., President of the Board of Agriculture, &c.:—

"On October 23, 1895, you were good enough to receive a Deputation from the Royal Scottish Arboricultural Society, which submitted to you the views of the Society on certain matters connected with forestry in Scotland; amongst them was the desirability of acquiring a State forest-area for experimental and educational purposes.

In compliance with the wishes you expressed on that occasion, the President of the Society forwarded, in November 1895, memoranda by certain members of the council, which set forth their individual opinions as to what the necessary expenditure by the State might be, in connection with the proposed forest area. But the whole question has recently been fully considered by the society, whose views are embodied in the printed note which we are now authorised to submit for your favourable consideration.

In this note you will find quoted the opinions of distinguished foreign experts that the sylvicultural practices prevailing in Scotland are open to adverse criticism. It explained how these practices arose, and why it is now a matter of great importance that reforms should be introduced; and it is shown to be impossible to hope for such reforms unless practical demonstration can be afforded, by means of model forests, of the results which improved methods lead to.

After a brief statement as to the nature of the instructions given in the State Forest Schools of other countries, and as to the provision of practical training-grounds as necessary adjuncts of such schools, the opinion is expressed that existing circumstances hardly appear to warrant the immediate foundation of an independent school in Scotland, and that the only plan now feasible is to improve and develop the courses of instruction in forestry now conducted in Edinburgh, by the provision of a State forest within easy access from the city; such a forest, while serving as a model for landed proprietors, agents, and factors, throughout the country, and as a station of experiment and research, would also be available for practical training in connection with these courses.

It is estimated that a capital expenditure of £40,000 with an annual grant of £500, would suffice to provide the required area; and the concluding section of the note shows why privately-owned forests would not answer the object in view, and why the Society is therefore compelled to ask the Government to aid it in these its first efforts towards the improvement of Forestry in this country, by providing a State model forest in connection with the Forest School in Edinburgh. (Signed) FRED. BAILEY, President.

R. C. MUNRO FERGUSON, Hon. Sec.
R. GALLOWAY, Sec."

CISSUS DISCOLOR, though a common and hardy some trailer in our hot-houses, does not frequently produce fruits. Mr. GEO. CRAGG, of Percy Lodge

Gardens, Winchmore Hill, sends us a shoot carrying one fruit, and he has some others. The fruit is a black berry, about the size and shape of a small Pea.

VINCA MINOR.

THE fruiting of this species is so uncommon that we have deemed it of interest to illustrate (fig. 14) some small pods formed on a plant growing in a pot on a balcony, where its trailing branches are very elegant. The fruit consists of a double follicle, as is common in the Order. Only one seed is formed, though there are remnants of others.

The plant in question was dug up at Guisnes, near Calais, several years ago, and has been grown successfully in a pot ever since, forming a most elegant plant for a hanging-basket or similar purpose. A year or two ago the plant also fruited, but the fruit was destroyed by an energetic housemaid.

The flower is probably insect-fertilised, but we do not know what insect has effected the operation; one would deem it rare from the rarity with which the pods are formed.

STRAWBERRIES AT MAIDSTONE IN 1898.

AN expert called on us last week, and we had a "tasting" of Strawberries. They are grown by us in the open fields for the sake of securing plants; but a certain portion we allow to bear fruit for trial and comparison, and the notes we have made may be of interest to your readers. In our district the Strawberry came into flower early, and those beds which are on land that faces the east were much cut by the late May frosts, and those that occurred early in June. So much so, that many came "bull-nosed" (pinched at the ends), while the "king" or first flowers of others were cut, thus greatly retarding the crop, the low night temperatures, often down to 40° and 46°, helping to the same end.

We were enabled to gather the first fruits on June 24, and as the plants of Laxton's No. 1 were cut, Royal Sovereign was the first. It grew in a bed that faced west, situated under a hedge, and very fine fruit, too. We fear many other kinds suffered from the cold besides No. 1, for some which have never failed before were at the tasting not so good as usual. It may be interesting to your readers to know that, when planting new beds, we dress the land only with horse and cow-manure the first year, and from these plants we obtain our runners and pot-plants. The 2-yr.-old plants had a dressing before the final spring-hoeing of ichthemio guano, soot, basic-slag, and kainit, and although these dressings have assisted the 2-yr. plants to bear fruit at their best (we do not fruit the 1-yr. plants), we fail to see that one dressing was better than another—a very slight difference was observable in the foliage, but so far as quantity, quality of the fruit, and continuity of bearing are concerned, no difference can be observed, though all have been beneficial. Gardeners, therefore, might use any of those named with advantage which are obtainable locally, for seldom have all kinds been better with us—to generalise. The following varieties have done as well as usual, and are therefore trustworthy:—Royal Sovereign, which has borne thrice as heavy a crop as any other variety, and all the fruits have been large, even in shape, and of excellent flavour. If we had only this one variety, we should not do badly; but Vicomtesse H. de Thury, Sir Joseph Paxton, President, Auguste Nicaise, Kitley's Goliath, Countess, Auguste Boisselot, King of the Earlies, Sir Charles Napier, and Trollope's Victoria maintain their good character, and may be described as trustworthy varieties.

Among the less known varieties, Laxton's Leader takes a high position so far as crop is concerned, but in our opinion (and the expert agrees), the fruit is ugly, furrowed, and pinched; but although enormous in size, flavour is lacking. Laxton's Monarch is very liable to go blind, as some 20 per cent. of our plants never produced a truss of bloom, although they were vigorous and healthy, and the fruit has a very fine

appearance, bright, shining, and very excellent for market purposes, but the good flavour necessary in a garden fruit is lacking, while blindness is a serious drawback. We noted at Chiswick that about 80 per cent. were blind. It would be interesting to hear the experience of others, as no fruit is more influenced by soil and situation than the Strawberry.

We specially tested for flavour, and finally gave the palm to Dr. Hogg as the best, and Countess ran it a close second. Other grandly-flavoured kinds were La France, Edward Lefort, Laxton's King of Earlies, St. Joseph, President, Kitley's Goliath, Trollope's Victoria, Auguste Boisselot, and Vicomtesse; and among the less-known kinds, the white perpetual kind, Louis Gauthier, held a high position, although at the end of our tasting the expert said, "Well, although I have eaten such a variety, I find that four of Gauthier have disappeared with gratification!" We have no doubt this pinky-white kind will be largely planted. It is a splendid bearer now, and as it gives another set of fruit in the autumn, it must take a prominent place. Being a free grower, it requires plenty of room; fruits, sometimes measuring 2 inches across, are plentiful; it resembles Laxton's White Knight, but fruits freely.

Another coming sort is the new perpetual hybrid, St. Joseph; this has a fruit like a small Vicomtesse, but possesses a remarkably distinct Hautbois flavour, and will take a prominent position among alpine or autumnal varieties.

Veitch's Perfection, which has distinct and delicious flavour, has not sufficiently established itself to enable us to decide as to its character, but doubtless it will prove an acquisition as a late fruiter. Wonderful,

FIG. 14.—SEED VESSEL OF VINCA MINOR.

certificated at Chiswick, is very fine, and a great cropper. Grosse Lombarde is a very long-pointed fruit, with a very sharp acid flavour, but so far no advance; König Albert is a fine round fruit, ripening thoroughly, and of distinct and pleasing flavour—good for mid-season supply; Edouard Lefort, is a distinct advance on Grosse Sucrée, of the same character, but a better grower and bearer (A.M., R.H.S.); Souvenir de Bossuet, as recommended, is so mixed that we cannot remark on it, the majority consisting of the old discarded Competitor; New Dumbarton Castle is a close compact grower, and gives large fine-flavoured excellent fruit, evidently a good dry season variety; Walbuff, which is a continental variety, has grand foliage, is rather late, but very prolific; President Carnot of 1897, proves to be La France, which came to us in 1895, and is well worthy of the award given by the Royal Horticultural Society—it is a vigorous grower, and a standard variety. Mr. Carmichael has sent out several late kinds, mostly crosses from Waterloo; but we fail to find superior merit in Prince of Wales and Princess of Wales (1895-96). His other varieties are not yet in condition, and we will report later; they all show Waterloo blood, and seem to be good bearers. George Rundle has proved worthless. We will make a few notes of the later varieties.

It is among these that we may hope for improvement. At present Waterloo, Eleanor, and Elton Pine are the best. A few kinds have not proved good this year, namely, Gunton Park, Lord Suffield, Unser Fritz, Georges Lésoir, and Filbert

Pine, but generally the latter three are extra fine, but the Gunton Park seedlings have only once in five years been good, so that for our district we cannot recommend them, though elsewhere they succeed. Countess, however, is grand, and cannot be too highly recommended; it is a small grower, and we think that to plant 1 foot by 2 feet would answer best, as the land, if the rows are wider planted, gets so dried up that the fruit does not develop. The habit of the different kinds is interesting: we pulled one truss of the old (Grovent) "Scarlet" (the jam-maker's favourite) with twenty fully ripe fruits; while, to look at Auguste Nicaise, one fails to see fruit until the leaves are put on one side, when the largeness of the crop of fruit is a surprise—this variety is A1 for forcing, but as an out-of-doors variety it is best in a dry year, when its ample foliage screens the crop. Laxton's Sensation and Stevens' Wonder are quite discarded for want of flavour, while the old Black Prince is yet of the best quality, and cannot yet be discarded. Empress of India is discarded as being too small a cropper; and Frogmore Late Pine can only be grown with success in certain spots, such as a rich border on a northern aspect. British Queen must still be grown, and it is a grand fruit in heavy soils, and where a big crop is not looked for. Noble must now be discarded, although as a preserving fruit it is worth a place, as the jam made from it is very high in colour.

Taking the season so far, we can credit 1898 with three good novelties—Louis Gauthier, Veitch's Perfection, and St. Joseph; possibly the later ones may yet give us varieties worth noting. It is our custom to destroy all beds that are two years old, but then we grow chiefly for plants. A few may stand three years, for affording fruit for jam-making; but where grand fruit is desired, two years should be the limit of age. *George Bunyard & Co., Maidstone, July, 1898.*

HOME CORRESPONDENCE.

DICKSON'S JUNE KING BROCCOLI.—I agree with Mr. E. Burbury's remarks, p. 8, concerning Dickson's June King Broccoli, for with me this variety came on in succession to Broccoli Model. A friend of mine cut a fine head in his garden to take with him to the Royal Agricultural Show at Birmingham, on June 18. *J. Barnard, Mostyn Hall Gardens.*

GARDENING CHARITIES AND SELF-HELP.—Mr. Ingram's statement does not in any way contradict or disprove my opinion that a subscriber to the Royal Benevolent Institution is sure of nothing except a vote. Mr. Monro states, "Such candidate is certain to be either elected a pensioner, or receive benefit;" but this is not corroborated by the secretary. The conditions of my offer are clearly stated, and therefore it remains in abeyance. The best charity of all is to help people to help themselves, and if this were thoroughly done, there would be less need for the Royal Benevolent Institution. *Thos. Fletcher.*

GLÆOSPORIUM LÆTICOLOR, AND A REMEDY FOR IT.—If your correspondent "J. McClelland" sprays his Grapes with methylated spirit, using Stone's pneumatic sprayer, or some other instrument that will produce only a very fine spray, I think he will soon be rid of *Glæosporium læticolor*, taking care that there is not enough spirit on the berries to form a drop, or it will cause them to decay. I should advise spraying after the sun has gone off the vinery or during a dull day with a little air on. I tried it here on muscats, a sample of which I sent to you, making the same enquiry as your present correspondent a few weeks ago; with the result, that I have only lost a few berries that were no doubt then infested with the fungus. The spirit evaporates quickly, and the Grapes can be sprayed again in a few days if thought necessary. I shall be pleased to give my experience in detail if you or any correspondent deem it worth publicity. *W. Button, Highden, Pulborough. [Do, please. Ed.]*

SHIRLEY POPPIES.—I was fortunate in obtaining from the great evolver of the Shirley Poppies a packet of seeds. They are in flower now, and I do not know anything more superbly beautiful in the way of tints. Many persons rave about Orchids, and pay high prices for them; they rave

about Auriculas, Carnations, and many other flowers; but nothing yet has come up to the magical tints that the Rev. W. Wilks has evolved out of the common field Poppy. Here are some of these exquisite variations, although no pen is competent to describe their loveliness. Pure white, pure scarlet, pure crimson, and an infinite variation of shades of these colours; then crimson edged white, white suffused with crimson, with rose, with salmon, rose edged white, fiery salmon-scarlet, plum-rose edged white, white with the faintest suffusion of rose, palest terra-cotta edged white, and an infinity of other combinations, which no language is adequate to describe. One rarely sees these beautiful things at exhibitions; no one can see them there, for the delicacy of their texture is such that they soon droop when cut. Now what use can be made of these exquisite flowers? Two great uses: (a) to cut them early in the morning as soon as they open, and at once plunge their stems in a jug of water, and carry them inside the house for the decoration of the rooms, and arrange them in vases with delicate Ferns or other light foliage. Nothing yet invented in the way of flower-tints and forms can equal their fascinating beauty. They should preferably be placed in a cool room. (b) This use should be particularly studied by silk-weavers, for if the tints of the Shirley Poppies can be imitated in silk fabrics, a new departure would be initiated, and a striking effect would be produced. The silk weaver should have a small garden near his factory, and pay special attention to the cultivation of the Shirley Poppies, and get his artist, when they flower, to take their tints and variations into his cerebral convolutions, and dream of them. The parasol or sunshade would especially lend itself to this new departure in tints, for the form of the sunshade is not unlike that of the Poppy turned inside out, and its margin might be given the edging coloration of this extraordinary flower. Fancy the Henley regatta, or other summer gathering, with tens of thousands of sunshades imitating the colorations of these Poppies. Why, it would be like a fairy exhibition, and people would go rather to see the sunshades than to see the boat-races. *E. Bonavia, M.D., July 8.*

"GRIMSTONE'S HISTORY OF THE EGYPTIAN PEA."—I am wondering if there is a copy of this pamphlet in existence at the present day. William Grimstone had a herbary at Highgate, when it was a much more open spot than it is now, and a dépôt in High Street, Bloomsbury. The pamphlet set forth that the Egyptian or Mummy Pea was discovered by some officials of the British Museum in a vase presented to them by Sir Gardiner Wilkinson, the celebrated Egyptian traveller. Three of the Peas taken from the vase were presented to Mr. Grimstone by Mr. T. L. Pettigrew, who assisted in opening this relic of the time of the Pharaohs, supposed to be 2844 years old. The growth of this Pea, the pamphlet went on to say, is different to those of this country: the taste is unequalled, they boil much greener than ours, and are so prolific that they can be planted 8 inches apart. A bag of the value of half-a-crown would produce enough for a whole family. They require no sticks, and the bloom hangs in clusters; and an advertisement of the pamphlet, which appeared in May, 1852, contained this sentence:—"Remember, the only genuine is sold in bags, half-a-crown; three times the quantity, five shillings; and seven times the quantity, ten shillings." At this time the pamphlet had reached a 30th edition, according to the author. If Messrs. Vilmorin & Co. are correct in describing in their *Plantes Potagères* the Mummy Pea as identical with the Crown or Cluster, then there is evidence that this variety was grown long before Grimstone avers it was found in a mummy, for it finds a place among leguminous plants in Peter Laws & Sons' *Agriculturists' Manual*, published in 1836; and it had no doubt been in cultivation many years previous to that date. *R. D.* [A specimen of the "crown" or "mummy" Pea was shown at the Drill Hall, on Tuesday. *Ed.*]

TREE-VIOLET.—These had their spell of popularity a good many years ago, but it did not last long. Your correspondent "H. R. W.'s" brief description of their successful culture at Stuttgart will doubtless set a good many growers trying again. This is exactly as it should be, for Tree-Violets can hardly be said to have had a fair trial on the whole. Too much was expected of them at the start, and then they were often left to be devoured by green-fly, thrips, and red-spider. But no one can deny their beauty when skilfully trained, cultivated, and bloomed, though your correspondent's Tree-Violet was that most gene-

rally aimed at here, yet several other forms were grown and bloomed more or less successfully. At times the stems of the Tree-Violets were budding by a series of flowering shoots tied on it at regular intervals, converting the tree into a pyramid of bloom in due season. In other cases tall 6, 7, or 8-inch pots were used, and the Violets trained to droop over and cover the pots at regular intervals. These weeping Violets were welcome, and rained down welcome verdure, colour, and fragrance on all around. But, of course, most Tree Violets were dwarf standards from 8 to 18 inches high, like standard Roses in miniature with all their flowers, and their stiffness and formality did their work in driving them out of the rank-and-file of ornamental plants. The race for height also helped to kill them or check their growth. Not a few growers strove to make their Tree-Violets higher and yet higher, forgetting, or ignoring the fact, that Nature had made Violets creepers or runners, not climbers; and she avenged herself for our folly in forcing her runners to climb to such giddy heights with crops of thrip and spider, instead of fragrant Violets and fresh green leaves. One more point in the manufacture of Tree-Violets, on the surest, safest lines: the whole of the preliminary processes of propagation, forcing, and training should be done in the open air. Select the longest and stoutest runners, plant a foot or 18 inches apart, furnish it with a stout stake from 8 inches to 18 inches high, tie up the runners, stop, train, &c., and let the plant run on in its flowering quarters in the open until it is carefully potted up for blooming. This method not only saves a great deal of labour, but ensures clean and vigorous Violets studded with blossom-buds, and abundantly furnished with fine foliage to start with. It seems that Tree-Violets are popular at Stuttgart, as your correspondent is able to conclude with the assurance that there is a ready sale for the plants and at remunerative prices. Probably there is room for a considerable trade in Tree-Violets here if they were so cheapened and improved as to attract the interest and affection of the toiling millions in town and country. *D. T. Fish.*

THE GOLDEN BLACK-CURRENT.—I was glad to see "A. D.'s" note in favour of this highly ornamental shrub. That the Currants are good eating cannot detract from the beauty of its fine foliage. There is another almost equally beautiful Black Currant, that is the cut-leaved, that deserves a place in the shrubbery for its beauty and distinctness of foliage, while it is one of the most prolific varieties, and of excellent quality. In this connection I should like to recall the merits of the golden-leaved Gooseberry, *Ribes alpinum aureum*, and the golden-flowered or Buffalo Currant, *Ribes aureum*. There is also an earlier-flowering sweeter-scented variety of the type, known as *R. a. præcox*, or *fragrans*. This golden-leaved Gooseberry is a dwarf grower, and has a striking effect in the front of shrubberies or on rock-work. The golden-flowered Currant grows freely, from 5 to 9 feet high, and forms a highly ornamental shrub through April and May. These, and other Gooseberries and Currants would grow well in shrubberies and pleasure-grounds with the more brilliant flowering Currants, such as *Ribes sanguineum*, *R. atropurpureum*, *R. speciosum*, the Fuchsia-flowered Gooseberry, &c. Few visitors to the very pretty, well-cultivated Botanic Gardens at Cambridge can have failed to admire the group formed of Grape-vines, Blackberries, and Crabs. These throw floods of new light on the artistic power of numbers in imparting landscape effects. *D. T. F.*

VITIS HETEROPHYLLA VARIEGATA.—I herewith send you a few shoots of this Vine, from a plant growing out-of-doors at the bottom of a west wall in the garden of C. T. Parker, Esq., Quorndon Lodge, Loughborough, and planted by Mr. Powell in ordinary garden soil. It has not had the slightest protection for over three years. The same variety was a striking feature in Mr. Mees' 1st prize group at the York show held recently. *D. O. N.*

MARLEY HALL, EXMOUTH.

THE seat of J. Forbes, Esq., is situated on beautifully rising ground some three miles from the above town. The country here is well wooded, fine plantations of Scotch Fir and Larch, and deciduous trees affording splendid game covert and protection from winds. The Hall, which is a modern building, is considered one of the finest in the county of Devon. The land on which it stands being 300 feet above

sea level, commands extensive views of the south Devon coast, the Estuary of the Exe, the Haldon Hills, and a considerable portion of the adjoining county. Many are the journeys that are made by residents and visitors to some special points about the grounds or near by, to gaze upon these charming scenes, for here, perhaps, in as large a measure as any in the county, the beauty and charm of Devonshire scenery can be observed; the broad mouth of the river with its bustle, fishing-boats, and other trading vessels, adding considerably to the interest and variety.

The farm lands in the immediate vicinity are well managed by their respective tenants, and if one may judge by appearances the severe strain felt by farmers elsewhere is absent in these parts. Truly, the soil and situation are both helpful factors; given these, with good tillage and sufficient labour, there is not the least doubt the Devon climate is on the side of the farmer, and good returns may generally be expected.

The pleasure-grounds, kitchen-gardens, &c., and glass erections at Marley, were planned and laid out by the late nursery firm of Lucomb, Pince & Co., of Exeter, and truly their work affords evidence of great skill and extensive practical acquaintance with laying out and garden structures. The lawns in the vicinity of the mansion are beautifully undulated and adorned with beds of Rhododendrons and choice shrubs, which have grown with a vigour so great, that the pruning-knife and hook have occasionally to be used among them, otherwise the clumps and beds would meet and encroach upon some of the foot-paths. Many grand Conifers stand about on the grounds, including *Araucaria imbricata*, *Sequoia gigantea*, *Abies Pinsapo*, various Cypressess, *Picea*, *Thuopsis*, &c., many of these trees being from 30 to 40 feet high, perfect in shape, with branches in most cases sweeping the turf. The same can be said of some beautiful Beech-trees, than which there is in my judgment, none of so beautiful and interesting a character just now, when the young leaves of bright and shining green are covering a noble and symmetrical specimen with their attractive foliage.

Immediately adjoining the mansion is a broad terrace paved with tiles of various colours, and around this on a low stone-wall are some three dozen good size vases filled with *Pelargonium*, *Lobelia*, and other interesting plants in the summer. As the season advances, and these vases get well filled and full of flower, they are much admired, and certainly are very showy. Passing across a lawn, a panel garden, a large oval-shaped portion sunk some 8 feet below the level, bounded sloping banks of turf is reached.

The beds in the centre have a row of dwarf Roses running right through them, banked on either side with *Anemone japonica*, *Honorine Joubert*, and then some 3 feet on each side of these are planted several thousands of Begonias in distinct colours—scarlet, pink, yellow, and white, in lines right round the whole. When towards July and August these get well established, this garden is beautiful and interesting, the cool and partly-shaded portion seeming just the position in which the Begonia delights in Devonshire. I have found in this district that if these plants are placed in too sunny a position, they do not develop so well as in a shady, cooler, and correspondingly moister spot. These conditions, I know, would not be the most advantageous in a comparatively sunless or damp district.

Passing into the kitchen-gardens, of which there are two, with walls or glass erections on either side, the first house to attract notice is the one in which Bananas are grown, which is some 40 feet long, about 8 feet wide, the front portion constructed of glass sashes some 12 feet high in 6 feet lengths, the lower ones being used as doors, or easily moved for convenience when the beds are being renewed; the roof slopes downwards towards the back wall, so that the back part is about 9 feet 6 inches high, a very plain house, easily put up, but most useful for the purpose to which it is devoted. The floor space is divided by loose bricks into divisions or pits 5 feet square, and a narrow path runs along the front. In each bed a young sucker is planted, which grows quickly,

that in a comparatively short space of time stout stems, and immense clusters of fruits are developed. Recently measured a stem, and found it to be, at least from the ground, 2 feet in circumference. A rich yet strong loamy soil, with manure-water occasionally, and a top-dressing when the fruit-clusters are showing, add much to the number and the size of the fruit.

The range of vineries is exactly 100 feet in length, divided into an early house, a Muscat, and a late house. These vineries are 10 feet wide, the borders inside and out, the rafter is 18 feet long, the front wall-plate 2 feet from the ground. Nothing could be finer than the foliage, wood, and crop these Vines are now carrying. Grapes in the early house were ripe four weeks ago, and the bunches of black Hamburgs, dark in colour and capitally finished, are very commendable. The Muscat Vines are well set, and have been thinned. Here, again, I noticed bunches of good shape, which, when finished, will be very creditable to the gardener, Mr. D. Baird. The Vines in the late house were just setting their flowers, mostly Lady Downe's Seedling, and the fruit these usually are kept well into the early months of the year. *W. Swan, Exmouth.*

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JUNE 26.—Present: Dr. M. T. Masters, in the chair; Mr. Bennett-Poë, Rev. W. Wilks, Dr. Müller, Mr. Veitch, and Rev. G. Henslow, Hon. Sec.

Pyrethrum Flowers, arrested.—Mr. E. Ballard sent some flowers, "taken from healthy roots, full of bloom, but on which some of the flowers fade, owing to the shrivelling of the stalk some 2 or 3 inches below the flower. Last year whole roots were affected." It is difficult to pronounce without seeing the early stages, but the general opinion was that frost had checked the buds, and a fungus, possibly a *Pyrenopeziza*, followed. Buds of *Pyrethrum*, arrested in an early stage, appeared to have been spoilt by frost and wet living got into them.

Beeches Dying.—Mrs. A. C. Campbell Swinton, of Berryell, Dunse, Berwickshire, sent some bark, &c., showing much decay, taken from a very fine old Beech at Kimmerghame. It was described as having a cavity at a fork in which rain-water lodged, but since the tree is only 19 yards from the bed of the river, the suggestion that the roots have got into the cold soil by the side or beneath the river, with very little doubt, correct. Beeches preferring dry soil by nature, the above would be a sufficiently probable cause. Mr. Wilks described a case where, in a space of 50 by 20 yards, every shrub and tree dies after a time. The destruction began with a hedge, then Scotch Firs, Oaks, Ashes, and lastly Beeches of about forty-five years of age perished. The cause appeared to be a bed of white sand into which the roots penetrated, thus starving the trees.

Black Currant Shoots Falling.—Mr. E. Ballard sent specimens from a large plantation, which break off at a slight touch or by the wind. Dr. William G. Smith, who has examined them, reports upon them as follows:—"The Currant leaves bore a mildew, but other fungi were also present when I examined the material. The characteristic mode of attack pointed to a species of *Peronospora*. I have raised good crops of one on fresh portions of the leaves, and am following up the clue. If it be really a species of this family it is new to Britain, although one (*Plasmopora ibicola*, Schroeter) has been reported from the United States of America. I have observed the emission of motile swarm spores from the sporangia (so-called spores) of fresh material, and otherwise feel sure of the *Peronosporæ* nature of this fungus. As to remedy, I should recommend a spraying of Bordeaux Mixture or allied copper mixture. To a Black Currant plantation, this could be done by a knapsack-sprayer. Probably one can be had from the Strawson Company."

Cherry Leaves Diseased.—Specimens of the foliage was received from Mr. B. G. Berry, F.R.H.S., Scarbutts Manor, Houghton, Faversham, and submitted to Dr. William G. Smith, who reports as follows:—"I cannot make up my mind whether the fungus on Cherry leaves you sent last week is *Cylindrosporium padi*, Karst, or *Cladosporium mygdalearum*, Pass. Both are given as causing spots on foliage similar to that sent. The spores are different, but I get both forms (or something very like them) present. In any case the fungus is the cause of trouble. The disease is common in the United States, though I have no definite record of its occurrence here. It is not considered serious, and yields easily to spraying remedies. I am afraid at present the crop is too far advanced to allow of immediate treatment, but as soon as it is plucked Bordeaux Mixture could be sprayed on the foliage. Next year the spraying could be continued as soon as the foliage is strong enough to allow it. The preparation of Bordeaux Mixture and allied

fungicides I have already described in the *Gardeners' Chronicle* last August. It should not be used towards the season of ripe fruit, as it stains the cherries, but applied before and after is reliable."

Black Currant × Gooseberry.—Mr. W. Culverwell, of Thorpe Perrow, Bedale, sent a fruiting spray of this curious hybrid, figured in the *Gardeners' Chronicle*, September 3, 1892, p. 271, showing well the resemblance to the manner of fruiting in the Currant, though it was entirely without its scent. The fruit resembled small Gooseberries, but the leaves had no spines.

Four-merous Odontoglossum.—Mr. McBean sent a spray of *O. crispum*, in which all the four blossoms upon it had the two anterior petals adherent to the sepal between them, three points indicating the fusion. In addition to the above, the sepals fused with the petals were petaloid and the ovaries were aborted. In two flowers it was S_2 and in the other two, S_3 that was petaloid.

Tuberous Growth on Vine.—Dr. Masters exhibited a specimen of an out-growth not uncommonly met with on Vines; similar ones are occasionally associated with a multiplication of buds. It is probably caused by a puncture of some insect, which sets up a subsequent growth by hypertrophy. A similar out-growth is occasionally seen on *Maréchal Niel* Roses.

JULY 12.—Those who thought the display at the Drill Hall on Tuesday would be in extent or interest less than usual, owing to large exhibitions taking place at Wolverhampton on the same day, and Newcastle-upon-Tyne on Wednesday, were very greatly surprised. So considerable was the number of exhibits that it was found necessary to utilise the space in front of the well-known screen near the entrance. But, after all, the circumstance is partly explained by the fact of the postponed Rose exhibition being held on Tuesday, and if the Rose stands in the competitive classes had been removed, the number of what may be termed ordinary exhibits would have been fewer than usual. These Roses were magnificent; not only was there very great competition, but the blooms in the majority of cases were of the finest quality, and proved beyond doubt that the present Rose season is a most satisfactory one. Several new Roses were shown that were thought sufficiently good and distinct to be given Awards of Merit. Next to the Roses, we may mention the Sweet Peas as comprising an important feature of the meeting, there being no fewer than four collections of these lovely and fragrant flowers. Next must be put the Malmaison and other Carnations; indeed, we seem to be experiencing a boom in Malmaison Carnations! Well, these three flowers, Roses, Sweet Peas, and Carnations, were the best represented on Tuesday, and it is singular that each should be so eminently fragrant. There were fewer Orchids than was general earlier in the season; but of fruit, an increased quantity was shown, including a collection from the Royal Gardens, Windsor, and some excellent Strawberries and Cherries from Messrs. JAS. VEITCH & SONS. Messrs. VEITCH's new Strawberry, Veitch's Prolific, was recommended a First-class Certificate; and a new Cucumber from Mr. MORTIMER an Award of Merit.

Floral Committee.

Present: W. Marshall, Esq., and Messrs. H. B. May, Jno. Fraser, John Laing, Geo. Gordon, Geo. Stevens, W. Howe, J. F. McLeod, J. Fraser, J. D. Pawle, Chas. E. Pearson, James Walker, Chas. E. Shea, H. J. Jones, H. J. Cutbush, H. Turner, E. T. Cook, Chas. Blick, W. Bain, Ed. Mawley, C. J. Salter, and John Jennings.

ROSES.

The best collection of eighteen single trusses (amateurs), was from Mr. O. G. ORPEN, Hill Side, West Bergholt, Colchester, and the blooms were very good. We might specify *Cleopatra*, Mrs. John Laing, Ulrich Brunner, Marquise Litta, Kaiserin Augusta Victoria, Helen Keller, and François Michelin as the most distinguished. The 2nd prize was taken by Mr. T. B. HAYWOOD, Woodhatch Lodge, Reigate (gr., Mr. C. J. Salter), who had a beautiful lot of even-sized, brightly-coloured blooms. There were twelve exhibitors in the class, and, as may be imagined, the 3rd prize exhibit from Mr. C. J. GRAHAME, Wrylands, Leatherhead, also contained very good blooms.

The next class was one for an equal number of trusses, but open to the trade as well as amateurs. It was won by an exhibit from Messrs. D. PRIOR & SON, Myland's Nursery, Colchester, and the blooms generally were first-rate. Particularly noticeable were Ulrich Brunner, Helen Keller, Gustave Piganeau, Mrs. J. Laing, Mrs. W. J. Grant (a pretty specimen, but pale in colour), and Maman Cochet. Messrs. F. CANT & CO., Braiswick Nursery, Colchester, showed splendidly for 2nd place; and Messrs. PAUL & SON, The Old Nurseries, Cheshunt, were 3rd.

The 1st prize collection of twelve single trusses, distinct, from Mr. E. MAWLEY, was capital. It contained a superb bloom of *Caroline Testout*, and scarcely less meritorious specimens of *Marquise Litta*, Mrs. W. J. Grant, and *Suzanne-Marie Rodocanachi*. ALFRED TATE, Esq., Downside, Leatherhead, was 2nd; and the Rev. A. FOSTER-MELLIAR, Sproughton Rectory, Ipswich, 3rd. There were ten competitors.

G. W. COOK, Esq., The Briars, North Finchley, won for six blooms, distinct, followed by J. T. THOMPSON, Esq., The

Laurels, Oak Lane, Bound's Green; and P. G. C. BURNAND, Esq., Hill Grange, Reigate.

The excellent variety Mrs. John Laing, shown by Mr. T. B. HAYWOOD, was the best variety exhibited in the class for nine blooms of any one variety of the H. P. or H. T. Rose. The blooms well portrayed this popular H. P. Rose. Mr. C. J. GRAHAME was 2nd, with the same variety; and Mr. OSMOND G. ORPEN 3rd, with magnificent blooms of *Kaiserin Augusta Victoria*.

There were many exhibits (fourteen) in the class for six blooms of any H. P. or H. T., but again the variety of Mrs. Jno. Laing was placed 1st, and the half-dozen blooms were from G. W. COOK, Esq.; ALFRED TATE, Esq., was 2nd, and E. M. BETHUNE, Esq., Denne Park, Horsbarn, 3rd, exhibiting Mrs. Jno. Laing in each case.

Teas and Noisettes.—The best collection of eighteen blooms of *Teas* or *Noisettes*, was one from Mr. ORPEN, in whose stand we might mention as superb specimens, the varieties *Cleopatra*, *Madame Cusin*, *Maman Cochet*, *Catherine Mermet*, *S. d'Elise Vardon*, and *Bridesmaid*; Mrs. E. M. BETHUNE was a capital 2nd, and the Rev. A. FOSTER-MELLIAR 3rd. The blooms in each of the exhibits were above the average in size and general good quality.

The similar competition, but open to nurserymen, was won by Messrs. D. PRIOR & SON, whose excellent exhibit was distinguished by superb blooms of *Bridesmaid*, *Maman Cochet*, *Jean Ducher*, *Caroline Kuster*, and *Ethel Brownlow*. Mr. GEO. PRINCE, of the Oxford Nurseries was 2nd, and excelled in the *Teas*, especially such varieties as *Comtesse de Nadaillac*. Messrs. PAUL & SON, Cheshunt, were 3rd.

The Rev. W. H. JACKSON, Stagsden Vicarage, Bedford (gr., Mr. R. Bonnett), won the class for twelve *Teas*, in not fewer than nine varieties, a Silver Cup accompanying the 1st prize in this case; J. T. STRANGE, Esq., Aldermaston, Reading, was 2nd; and Mr. E. MAWLEY 3rd.

Miss B. H. LANGTON, Raynham, Hendon, had 1st prize for six single trusses, in not fewer than four varieties.

The best variety in the single variety class was *Souvenir de Souv. A. Prince*, nine large blooms of which were shown by Mrs. O. G. ORPEN; *Madame de Watteville* from C. J. GRAHAME; and *Madame Hoste* from the Rev. W. H. JACKSON, were 2nd and 3rd respectively.

In the six single trusses of one variety class, the prizes were awarded to The Bride, *Souvenir d'Elise Vardon*, and *Maman Cochet*, in the order named.

Mr. CHAS. TURNER, Royal Nurseries, Slough, showed a dozen blooms of a new H. P. Rose, named *Edith Turner*, a pretty flower of faint flesh-colour, the older petals becoming white. The petals have good form, are rather short, and the variety is likely to be a popular one (Award of Merit).

MESSRS. FRANK CANT & CO., Braiswick Nursery, Colchester, made a grand exhibit of garden Roses in sprays, the selection of varieties being very choice. The distinct-coloured *T. Rose Souvenir de Catherine Guillot* was conspicuous amongst the varieties (Silver Banksian Medal).

Messrs. W. PAUL & SON, Waltham Cross, had a group of Roses in pots, and a variety of cut blooms in boxes. The plants in pots were dwarf, well-flowered, and excellent specimens; and the standards were also good. Messrs. PAUL had blooms of a H. P. Rose, named *Milton*, of a purple-red tint, very large, which to us appeared rather rough, but Mr. Paul predicts a popularity for it; also a H. T. Rose, named *Tennyson*, nearly white; *Wordsworth*, the result of a cross between a *Tea* and a China Rose, apparently a good garden variety, with reddish flowers; H. P. Waltham Standard was shown, and a very promising H. T. of distinct tint, and named *Exquisite* (Silver Banksian Medal).

LORD PENZANCE, Eashing Park, Godalming (gr., Mr. George Baskett), made an exhibit of very pretty hybrid Sweet Briars, and garden Roses in additional varieties (Silver Flora Medal).

F. W. CAMPION, Esq., Colley Manor, Reigate, had also a pretty collection of Roses, and was awarded a Silver Banksian Medal. Mr. CHAS. TURNER, Slough, who made a showy display of very useful varieties of Roses, obtained a Silver Flora Medal; and to Messrs. GEO. PAUL & SON, Cheshunt, who had also a group of Roses, including the fine single-flowered *Dawn* already noticed several times previously. An award of a Silver Banksian Medal was made.

CARNATIONS.

MARTIN R. SMITH, Esq., Warren House, Hayes, Kent (gr., Mr. Blick), again put up a group of Malmaison Carnations. These were good plants and flowers, albeit some of the blooms showed signs of having passed their prime. The varieties were *Calypso*, white or pale blush, warming towards the centre (Award of Merit); Mrs. Trelawny, smaller flower crimson; King Oscar, a good-sized flower of bright crimson; Mrs. Martin R. Smith, a large, beautiful, rosy-pink flower (Award of Merit); Lancer, one of the very brightest in colour; Scott and Mercia, both deeply-coloured varieties, differing only in shade; Lord Welby, and The Geisha, also brilliantly-coloured flowers of great merit; and Thora, almost pure white, very large (Silver-gilt Banksian Medal).

A group of Malmaison Carnations from DANIEL COOPER, Esq., Warren Towers, Newmarket (gr., Mr. T. Young), consisted of fine plants, apparently last year's layers, but potted on into 7-inch pots. Most of them had one expanded bloom of very large size, and the group was a decidedly good one (Silver Flora Medal).

Mr. JAS. DOUGLAS, Edenside Nursery, Great Bookham, made an exhibit of cut flowers of the newest and best varieties of Malmaison and other Carnations, including many raised by Mr. Martin R. Smith and himself. An Award of Merit was recommended to a pure white-flowering variety of Malmaison Carnation, named *Nell Gwynne*, but the collec-

tion included many other valuable varieties of the different sections, besides a few old Chelsea Pinks.

An Award of Merit was recommended to a perpetual flowering Carnation, named Sundridge, exhibited by Mr. F. TAPPER, Sundridge Park. This is a magnificent scarlet variety, the blooms being of exquisite form.

Mr. Whellan, gr. to the Duke of MARLBOROUGH, Blenheim Palace, Woodstock, and Mr. Geo. Reynolds, gr. to Messrs. DE ROTHSCHILD also showed new varieties of Carnations.

SWEET PEAS.

Sweet Pea exhibits included a most tasteful and fragrant display from Mr. HENRY ECKFORD, Wem, Shropshire. These, arranged in tall glasses, were very lovely; the few grasses mixed with the flowers, however, we thought hardly an improvement—the Pea-bine is more suitable. Some of the newest and most exquisite varieties we noticed were the following:—Fascination, of several shades of purple; Bouverie, pale pink; Lady Skelmersdale, white, with pale purple keel; Mrs. Dugdale, a lovely rosy-pink flower of various shades; Othello, deep brown-crimson; Sadie Burpee, pure white; and Duchess of Westminster, salmon-buff coloured. Other varieties, such as Lady Mary Currie, Prince of Wales, Duke of York, Lottie Eckford, Triumph, Prince Edward of York, Chancellor, and Mars, were displayed to good advantage (Silver Banksian Medal).

Mr. F. G. FOSTER, Brockhampton Nurseries, Havant, made a very fine exhibit of Sweet Peas, and the variety Aurora, with large rose-striped flowers upon a white ground, was given an Award of Merit. It is a capital variety, of a good colour. There were upwards of sixty varieties in this collection, and the flowers were all of good quality. An Award was recommended to Golden Gate, a variety named after a gate to one of the ports of Chicago, owing, it is said, to the flower opening similarly to the gates. It is an American variety—one of the lighter purple-coloured ones, but very variable. (A Silver Flora Medal was awarded the group).

Messrs. CARTER & CO., High Holborn, had a display of Sweet Peas, the flowers being put into small glass bottles, several only in a bottle, and six or eight bottles in each Eastern bulb-bowl, which was filled with moss. Some of the prettiest in this collection were Invincible, scarlet; Mrs. Gladstone, pale-pink; Mrs. Eckford, cream-coloured; Miss Hunt, and Invincible, carmine; Mrs. Sankay, white; Orange Prince, and Duchess of Edinburgh. These Peas were backed by finely-cultivated Delphiniums, the excellent strain being known as Wedding Bells (Silver Banksian Medal).

Messrs. H. CANNELL & SONS, Swanley, Kent, put up a collection of Sweet Peas, and being bunched in tall glasses, the lower parts of these were hidden by a groundwork of bracken fronds. There were six dozen varieties, and having been well cultivated, the flowers presented the varieties in excellent condition (Silver Banksian Medal).

OTHER EXHIBITS.

Exhibits of Ferns were made by Messrs. J. HILL & SON, Lower Edmonton, and Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton. In the former collection were some fine specimen plants of Davallias, Nephrolepis, and Adiantum Farleyense (Silver Banksian Medal); and Mr. H. B. MAY's group was composed entirely of species and varieties of Asplenium, there being as many as sixty-five different forms represented (Silver Banksian Medal).

Mr. MAY also showed plants of the white variety of Swainsonia galegifolia, and a profusely flowered specimen of the purple-flowered Exacum macranthum, generally so difficult to grow.

A hybrid Polystichum from P. angulare × aculeatum was shown by Mr. WM. MARSHALL, Auchinraith, Bexley, and was awarded a First-class Certificate. The plants carried fourteen or sixteen large fronds, and exhibiting characteristics from both parents; it is an interesting hybrid.

From N. N. SHERWOOD, Esq., Dunedin, Streatham Hill, S.W., were shown plants of the dwarf Cupid strain of Sweet Peas. These represented the varieties Eliza Eckford, rose-coloured and white; and Primrose, a name descriptive of the colour. The plants were in pots, and bore numerous flowers.

Mr. Bain, gr. to Sir T. LAWRENCE, Burford, Dorset, showed a few sprays of Philadelphus Lemoini Candelabra.

Messrs. KOSTER & CO., Hollandia Nursery, Boskoop, Holland, was awarded a First-class Certificate for Picea pungens glauca pendula, a magnificent plant of which, over 8 feet in height, was shown. The silver tinted foliage and pendulous branches were very striking.

Messrs. WALLACE & CO., of Colchester, had a fine display of Lilies, conspicuous being varieties of L. Thunbergianum, pardalinum, speciosum, &c.; also a few lovely Calochorti (Bronze Banksian Medal).

Messrs. BARR & SONS, King Street, Covent Garden, London, W.C., made an exhibit of blooms of varieties of Japanese Iris. These were exceedingly pretty, and the number of varieties exceeded fifty. Fine spikes of the yellow-flowered Eremurus Bungei were also shown (Silver Banksian Medal).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, again staged a group of cut annuals, &c., of choice varieties in glasses, presumably for the Hurst Cup. The principal flowers used were Campanulas, Godetias, Candytufts, Linaria reticulata, Sweet Peas, Carnations, and some lovely Shirley Poppies. Messrs. Veitch had also sprays of Spirea bullata, the yellow-flowered Cytisus nigricans, Rubus canadensis rosea, and a few plants in flower of the pink Calla (Richardia Rehmanni). These had been lifted from the open ground, and the flowers were rather more pink in colour than we have previously observed in this rather disappointing plant.

Mr. MAY obtained an Award of Merit for Asplenium ornatum. This variety is a decided improvement upon A. Mayi, an earlier acquisition (figured in the *Gardeners' Chronicle*, p. 371 of our last volume), the fronds being more sub-divided, and the plant is consequently more light and graceful in appearance.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair, and Messrs. Jas. O'Brien (Hon. Sec.), de B. Crawshaw, W. H. White, H. Little, H. M. Pollett, A. H. Smee, H. J. Chapman, W. H. Young, Walter Cobb, H. Williams, W. H. Protheroe, S. Courtauld, H. Ballantine, E. Hill, and J. Douglas.

As usual at this season there was a falling-off in the number of Orchid exhibits. The only group of any extent was a very fine display of noble specimens of Cattleya Warscewiczii (gigas), sent by J. W. TEMPLE, Esq., Leyswood, Groombridge (gr., Mr. Bristow), and for which he was awarded a Silver Flora Medal. The group was made up of forty-three plants, bearing in the aggregate over 160 flowers. The different plants showed great variation, running from the large light-rose tinted form to the dark type known as Sanderiana. A noteworthy fact is that many of the plants have been grown from an importation made in 1883.

Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr., Mr. W. H. White), again showed the fine Vanda × Miss Joaquim (Hookeriana × teres), with a splendid inflorescence of twelve fully expanded flowers and three buds (Cultural Commendation); also Oncidium albo-verrucosum (provisionally named), with bright yellow flowers, having a white worted crest, and some brown markings on the sepals. It bore some abortive flowers after the manner of O. abortivum (Botanical Certificate).

HERBERT HICKS, Esq., Bramwood, Chelmsford (gr., Mr. Machar), showed a grand plant of Dendrobium Dearei, grown in his gardens for a period of four years, and now bearing leafy pseudo-bulbs over 3 feet in length. The plant bore thirteen spikes; the largest pseudo-bulb having three large racemes of pure white flowers to the number of thirty-three; and four spikes had already been cut. It was stated that when it flowered before, the plant was more or less in bloom from April until the following February. A Silver Banksian Medal and Cultural Commendation was awarded.

Messrs. HUGH LOW & CO., Bush Hill Park, showed the fine white Cattleya Gaskelliana alba, and another pretty bluish-tinted form; also Cypripedium × T. W. Bond, C. × Alice; Bulbophyllum Dearei, and a pretty rose-spotted form of Odontoglossum citreolum.

Mr. WILLIAM BULL, King's Road, Chelsea, showed Oncidium macranthum Chelsiense, a large form, with purple-tinted sepals, and a dark purple blotch at the base of the petals.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed Cattleya Warscewiczii var. Rothschildiana, a handsome and peculiar form, in which the bright purple labellum is devoid of the yellow patches seen on each side of the disc in the typical form.

Baron Sir H. SCHRODER, The Dell, Staines (gr., Mr. H. Ballantine), showed a branched inflorescence of a peculiar white form of Odontoglossum crispum, with broad ovate lip, bearing a few pale purple blotches in front of the yellow crest—probably, O. crispum Lehmanni.

Fruit Committee.

Present: Geo. Bunyard, Esq., chairman; and Messrs. Jas. H. Veitch, A. F. Barron, Alex. Dean, Geo. Wythes, H. Balderston, F. Q. Lane, and Robt. Fife.

Mr. Owen Thomas, gr. to the QUEEN, Frogmore, showed a collection of fruit consisting of thirteen dishes of Cherries, viz., Downton, Black Eagle, Frogmore Bigarreau, Archduke, Knight's Early Black, Elton, Royal Duke, Kentish, May Duke, Governor Wood, Late Duke, and Frogmore Early Bigarreau; four varieties of Peaches, including Violette Hâtive; two dishes Walburton Admirable, very large, but rather light in colour, and Grosse Mignonne; three dishes of Nectarines; and lastly, twenty-eight dishes of Strawberries, including fine fruit of the following varieties, viz.:—President, excellent; Keen's Seedling, Auguste Nicaise, Scarlet Queen, Aromatic, Vicomtesse Héricart du Thury, The Countess, Jas. Veitch, and Bicton Pine (white), seldom seen in good condition. A new Melon, Cambrian = Beechwood × Duchess, and Frogmore Selected Tomato completed the collection. A Silver-gilt Knightian Medal was awarded the exhibitor. The fruits of all kinds were the pink of perfection, and although the newer varieties of Strawberries took the eye for size and colour, the true test of dessert fruit, namely fine flavour, remained we opine with the older ones.

Messrs. J. VEITCH & SONS, Chelsea, had an extensive exhibit of dishes of fruit in season, branches of Black Hawk and Frogmore Bigarreau Cherries fruit laden, and trees in pots with ripe and ripening fruit upon them. Growing in pots were noted Empress Eugénie, May Duke, Elton, Nouvelle Royale, and Governor Wood.

Gathered fruits of Cherries, shown in square boxes, consisted of the varieties Governor Wood, Guigne d'Anonnay, Archduke, Elton, Black Hawk, Belle d'Orleans, Cleveland Bigarreau, Mammoth, Baumann's May, and Adam's Crown. All of these were the produce of pyramids growing in the open border.

Strawberries to the number of sixteen dishes were shown in old and new varieties, and we noted the following:—Sensation, La France, Lucas, Lord Suffield, Jas. Veitch, Ed. Lefort, Gunton Park, Auguste Boisselot, Waterloo, British Queen, President, Cardinal, Royal Sovereign, Elton, Exqui-

site, and Prolific, a variety raised between Empress of India and British Queen, which was awarded a First-class Certificate. Prolific is almost of British Queen shape, but bright crimson throughout, and it ripens to the tip. The form is either coxcomb or conical. Some bearing shoots of the variety were shown, most abundantly fruited; also some plants lifted from the open ground (a Silver Knightian Medal was awarded).

Several Melons were shown by various growers, but none seems to have satisfied the judges.

Mr. S. MORTIMER, the Nurseries, Rowledge, Farnham, showed five fruits of a Cucumber called Sensation, receiving a First-class Certificate. It is a handsome dark green-coloured fruit, with no ribs, and but little neck.

Messrs. LAXTON BROTHERS, Bedford, showed a seedling unnamed Strawberry out of Royal Sovereign, crossed with Commander, a large, light-coloured fruit of generally conical shape, and in regard to flavour it leaves something to be desired. Leader was another variety, shown in extremely fine samples. The firm showed Pea Thomas Laxton, a green, narrow, and well-filled symmetrical-shaped pod.

Mr. H. ECKFORD, Wem, Salop, showed a number of new varieties of culinary Peas, but there was apparently nothing that was considered by the Committee as being improvements on existing varieties.

Mr. BAIN, gr. at Burford Lodge, Dorking, showed Peach Royal Charlotte, of very fair size for the produce of a tree thirty years old (Vote of Thanks).

Messrs. H. CANNELL & SONS, Swanley Junction, showed ten dishes and varieties of Peas, including such big-podded ones as Lord Mayor, Epicurean, Stourbridge, Gradus, and Duke of Norfolk (Cultural Commendation).

Miss RIDGE, Highfield, Staines (gr., Mr. G. Lane), showed six bunches of Black Hainburgh Grapes, of so good a quality, and large and well finished, that they were considered to be worthy of a Bronze Banksian Medal.

The Maharajah of Gwalior showed dried Cabbage, Cauliflower, Carrot, and likewise in a soaked state, as prepared for cooking. These were prepared by Mr. Maries, Superintendent of the State Garden, Gwalior, India. Such preparations are intended for use during the rainy season in India, when culinary vegetables are scarce.

Messrs. J. CARTER & CO., 143, High Holborn, exhibited fifty dishes, in as many varieties, of Peas, being awarded a Silver Banksian Medal.

Lecture on Peas.

In the afternoon a lecture upon Peas was delivered by Mr. N. N. SHERWOOD, the well-known head of the famous Hounsdlitch seed firm, Messrs. Hurst & Son. Mr. A. SUTTON (Reading) occupied the chair, and was supported by Mr. HARRY J. VEITCH. "The Ancient History of the Garden Pea" would be a very suitable designation of the carefully-prepared paper read by Mr. Sherwood. Commencing at a date more than 2000 years ago, Mr. Sherwood gave the results of painstaking research as to the very earliest mention of the Pea in horticultural, scientific, and other works. These, as might be expected, are exceedingly fragmentary, and our ignorance of its native country, though regrettable, is by no means surprising in the case of a plant that has been cultivated almost everywhere; and in certain places, for such an indefinite period. Mr. Sherwood declared that no evidence is forthcoming that the Pea was cultivated either by the ancient Egyptians or by the Hebrews; but as Mr. Sutton afterwards pointed out, there are Peas in the museum at Cairo that have been taken from Egyptian mummies, and though the old legend respecting the mummy Pea is now very properly discredited, there remains the fact that Peas (though these have never germinated) have been taken from the mummies. Treading upon ground a little firmer, it was stated that the Pea was introduced to China at the end of the sixteenth century, but as early as 1066 it has been described (said the lecturer) as one of the chief vegetable crops in England. It was in the sixteenth and seventeenth centuries, however, that frequent mention of garden Peas was made by Gerard and other writers, and photographs were shown of several Peas, illustrated in Gerard's *Historie of Plants*. At the end of the eighteenth century, and through the work of Mr. T. A. Knight, who was President of the Horticultural Society of London, the first wrinkled Peas were obtained; and as these are the parents of the excellent wrinkled Marrowfats of the present day, we are very greatly indebted to Mr. Knight. Consequently, the Knightian Medals that the Royal Horticultural Society now award should be much prized, inasmuch as they are in memory of a man who, in regard to Peas and many other garden plants, did excellent experimental work. Mr. Sherwood read a quotation from a paper by Mr. Knight in *Philosophical Transactions*, 1799, in which was explained the history of the production of those early wrinkled Peas; but it was in 1787 that Knight made his first experiment, and this was performed upon a plant that had ceased to be productive, presumably, because self-fertilisation did not take place. The cross-fertilisation and selection that eventually enabled Knight to send out his wrinkled varieties, being fully recorded in the *Transactions*, the origin of the strain is better understood than many equally important developments that have been obtained in other plants, but of which no published details are available. After quoting several lists of Peas published by Miller and others in the early years of the present century, Mr. Sherwood said that in 1850, Dr. McLean, of Colchester, was busy in raising new Peas; and several of these, including Epicurean, were introduced by Mr. Turner in 1859. Thomas Laxton and Mr. Eckford, of Wem, had subsequently

ved much success in the raising of improved varieties garden Peas; and to Mr. Culverwell also did we owe a debt for successful work done in the same direction. Messrs. Sutton & Sons had sent out some first-rate Peas of the last ten years, such as May Queen, Excelsior, Jubilee, Perfection, and Late Queen. There had been improvement effected in fruits, flowers, and vegetables of the Victorian era, but the Pea furnished the most convincing evidence of development during that period. Sherwood then gave a little information as to the means by the seedsmen to procure true seeds for sale, and referring to the dying-out of inferior varieties, mentioned there are something like 625 names of Peas this year, so lately were there new varieties sent out—or, added Mr. Wood, old friends with new names. He was convinced the number of names could be advantageously very materially reduced. Mr. Hurst's firm had now as many 10 rows of Peas in their trial grounds in Essex.

The process of cross-fertilisation was next explained, in the one essential precaution to prevent self-fertilisation, by means of the early removal of the anthers. The timing pod might contain six Peas, and each of these would be likely to differ in some respects from each other. They should be sown separately, and the produce from each sown in rows; then by careful selection during a few years, the characteristic quality of each variety may be ascertained, fixed, and probably increased.

After some remarks by Mr. Veitch, Mr. A. Dean, and Mr. Ford, the Chairman (Mr. Sutton) referring to the unique position in the "Seed" world held by Mr. Sherwood, said the Society was fortunate in having a lecture upon the Pea from one so eminently qualified to speak of it. Though the story of the mummy Pea (*Pisum unbellatum*) was a discredited legend, there is, said Mr. Sutton, sufficient evidence Peas were actually put into mummies, and he was sure that they cannot be otherwise traced in ancient Egypt.

GLOUCESTERSHIRE ROSE.

JULY 30.—The tenth annual exhibition was held at Gloucester on the above date. The collection of forty-eight varieties from Messrs. A. DICKSON & SONS, of Newtownards, Down, were most excellent, and contained thirteen varieties raised by themselves. Of the seedlings exhibited, which the highest Awards had been given by the National Society, Miss Bessie Brown won the Gold Medal at this year, Ulster last year, Countess of Caledon in 1897, and Mrs. W. J. Grant in 1895. Messrs. DICKSON also in Teas, closely followed by Mr. JOHN MATTOCK of Oxford.

In the open classes, the most attractive collection of Roses on show was one of twelve blooms of Mrs. W. J. Grant. This year Messrs. DICKSON won seven 1sts with the same collection, out of as many competitions.

In the classes for Gloucestershire amateurs, the entry was excellent. The Gold Medal given by the Society was awarded to Mr. E. C. HOPKIN, of Hucclecote, for a splendid collection of twelve varieties. The 1st prize, given by the Mayor and Corporation of Gloucester, was secured by Mr. T. THORPE, Wotton, with twelve lovely blooms.

A piece of plate given by the ex-high-sheriff for the best of twelve Teas, distinct, went to Mr. CONWAY JONES, of Hucclecote, as did also a Silver Medal, given by the Society for the best Tea Rose—Niphetos. A Silver Medal for the best hybrid was won by Mr. LANE, of Quedgeley, with a Teas and Bowyer.

A conspicuous and attractive feature of the show was the sections of garden and Moss Roses shown by Mr. JOHN MATTOCK and Messrs. HALL & PROSSER, of Malson, Gloucestershire. The cultivation of these Roses has been much encouraged by the Society.

In addition to the above-mentioned prize-winners, in the classes for nurserymen, Messrs. TOWNSEND & SON, Worcester, secured a couple of 1sts for thirty-six varieties (single trusses), twelve varieties (three of each); and two 2nd prizes for twelve varieties (single trusses, Tea or Noisette), and twelve varieties (three of each, Tea or Noisette). Messrs. PEWTERESS & SONS, Hereford, were awarded a 2nd prize for eighteen varieties of Teas or Noisettes.

CHELMSFORD AND ESSEX HORTICULTURAL.

JULY 6.—With Captain F. H. G. CRUIKSHANK as President, and by an active committee, with the indefatigable Mr. T. WEEKS as Honorary Secretary, the shows of this Society have steadily improved. Last year the weather was propitious, but the present show, which was held in the Recreation Ground, instead of being arranged in private grounds, as formerly, had the advantage of very delightful weather, and consequently was very largely patronised.

The show, in the opinion of most persons, was generally thought to be the best that has as yet been held under the auspices of the Society, both as regards the competition and the general arrangement. It is noteworthy that the classes for plants and flowers only one class (Violas) failed to secure entries, and the whole of the entry schedule only had three or four such instances. The classes were well filled, and contributed the most attractive feature in the show, the 1st prize, dinner-table decoration of Mrs. C. POTTER; the 2nd, of the Misses DENNIS and FINCH; and the 3rd, of Miss B. REMNANT, being truly artistic arrangements, and several of the others so good as to give

the judges considerable trouble. The President's Cup for six stove and greenhouse plants was secured by Mr. J. Burrell, gr. to W. W. DUFFIELD, Esq., Broomfield, who also carried off about a dozen other leading prizes. Other very successful competitors were Mr. T. BRAZIER, gr. to Mrs. GRAY, of Chelmsford; Mr. W. HAMMOND, gr. to A. PARRY, Esq., Margaretting; and Mr. H. HOLLOWAY, gr. to G. H. BAXTER, Esq., Hutton Park; the last-named securing the 1st prize for a group arranged for effect with a very beautiful arrangement.

Roses were a great feature, the 1st prize for thirty-six distinct single trusses falling to Messrs. F. CANT & Co., of Colchester, who staged a magnificent lot; the 2nd, Mr. B. CANT; and 3rd, Messrs. PRIOR & SON, being well in competition.

In the class for twelve, three trusses each, Mr. B. CANT came in 1st, Messrs. PRIOR & SON 2nd, and F. CANT 3rd.

In the amateurs' classes (Roses), Mr. H. B. LONDON, Sheffield, took most of the 1st prizes. Other fine features in the Show were a very beautiful and extensive group staged by Messrs. SALTMARSH, of Chelmsford; a showy group of hardy plants, by Messrs. W. PAUL & SON, Waltham Cross; a very beautiful and interesting group of hardy plants, by WALLACE & Co., of Colchester, in which the charming forms of *Mariposa Lily*, which they grow so well, was an attractive feature.

DEVON AND EXETER GARDENERS.

JULY 6.—The seventh annual excursion was made on the above date in brilliant weather, about sixty members and honorary members taking part in it.

On arrival by train at Tavistock, several interesting places in that historic town were visited. After lunch, the party proceeded by bridle to Endsleigh, the charming Devonshire seat of the Duke of Bedford, about eight miles from Tavistock.

On arriving at Endsleigh, Mr. Yole, the Duke's gardener, led the visitors by winding-paths along the cliff side down into the valley, where "The Cottage" lies nestling amid a sylvan Paradise. The extent of the place may be gathered from the fact that there are about 100 acres of pleasure-grounds, a 7-miles' turf-gallop around the woods, and about 20 miles of paths and roads within the demesne. Some of the peeps from the cliff-walk show miles of woods on either side, with Endsleigh in the valley, and the Tamar meandering far beneath, and they were quite enchanting.

The house is approached by a lawn in the most perfect condition, overlooked by a terrace walk, canopied with Roses on an overarching trellis. Bold overhanging rocks are seen clothed with *Rhododendrons*, *Ivies*, and underwood of various species. Among the specimen trees was one of *Abies Douglasii*, over 80 feet high, and 6 feet in diameter; the tree had recovered from a snowstorm which broke down its branches in 1890. A fine *Liquidambar*, 50 feet high. Of Bamboos, *Phyllostachys nigra*, 18 feet high; *P. viridi-glaucescens*, and *P. aurea*, were very fine. *Spiraea Lindleyana* was 14 feet to 15 feet through; *Sequoia japonica*, and a grand Weeping Beech of about 60 feet high, with pendulous branches dropping sheer by the side of the trunk, was a striking specimen. *Salisburia adiantifolia*, *Cryptomeria elegans*, *Retinospora plumosa*, *Gunnera manicata* with leaves 7 to 8 feet across, *G. scabra*, *Osmunda regalis*, *Paulownias* and *Catalpas*, *Photinia serrulata*, *Pinus Strobus*, and many other fine trees and plants were growing luxuriantly in ideal situations.

The *Rhododendrons* which clothe the rugged slopes had already bloomed. A cascade, or rather, a series of cascades, in a sequestered dell under "The Cottage," gave a picturesque aspect to the place. A grotto exceedingly rich in shells and minerals was visited, a hermitage-like dairy, and a verandah paved with sheep knuckle-bones, proved interesting to the visitors. There is very little glass, Endsleigh depending upon its out-of-door effect for its attractions, which are undoubtedly great.

WOLVERHAMPTON FLORAL FETE.

JULY 12, 13, 14.—Wolverhampton scored another gratifying success on the occasion of the tenth annual exhibition, which took place on the above dates in the West Park. Six broad, long tents were required to accommodate the exhibits. How prosperous the exhibitions have been is shown by the fact that during the past ten years the sum of £4,000 has been realised, a good proportion of which has been devoted to embellishing the West Park. It was the general opinion that the exhibition was one of the best ever held in Wolverhampton.

PLANTS.

The huge tent in which the specimen plants were staged was a beautiful picture of stately Palms and plants. The veteran Mr. CYPHER was again triumphant in the class for sixteen plants. He had as a background magnificent *Kentias*, and a huge *Latania*; two brilliant *Codiaeums* fringed these, and then a line of flowering subjects, foremost the big example of *Phenocoma prolifera* Barnesii, *Allamanda nobilis*, *Ixora salicifolia*, *Statice profusa*, *Bougainvillea glabra*, &c. Mr. W. FINCH, Coventry, was a good 2nd. Mr. W. VAUSE, Leamington, 3rd.

With six plants in flower, Mr. CYPHER was again 1st, staging very good examples of *Erica ventricosa* Bothwelliana, *Allamanda nobilis*, *Statice profusa*, *Ixora Williamsii*, and two others. Messrs. FINCH and VAUSE, who had in the main similar subjects, were 2nd and 3rd.

Mr. CYPHER was the only exhibitor of eight exotic Orchids, and had good examples of *Vanda cœrulea*, *Cattleyas Gaskelliana* and *Mossiae*, *Lælia purpurata*, *Sobralia macrantha*, *Oncidium macranthum*, *Masdevallia Harryana*, &c.

Palms in sixes were an imposing feature. Mr. CYPHER again 1st, with *Kentias Forsteriana*, *Belmoreana*, and *Australis*, *Livistona chinensis*, *Phoenix rupicola*, and *Thrinax elegans*. Mr. Cryer, gr. to G. H. KENDRICK, Esq., Birmingham, was 2nd.

For six fine-foliage plants, Mr. CYPHER again triumphed. He had two fine *Kentias*, *Latania borbonica*, two richly-coloured *Crotons*, and a *Dasyliro*.

Mr. M. CAMPBELL, Blantyre, had the best six exotic Ferns, all good specimens.

Groups arranged for effect were a great feature, and the square ground plan, with its scalloped sides, is now very largely followed. In the class for groups covering 450 feet, Mr. CYPHER was 1st, and the judges expressed the belief that it was one of the very best he had ever staged: all the details were elaborately symmetrical, and the artistic touches charming. Mr. J. E. KNIGHT, nurseryman, Wolverhampton, was 2nd; and Mr. W. VAUSE, 3rd; the groups in both cases being constructed on similar lines. In the gardeners' division the best group of 350 feet came from Mr. CRYER; Mr. R. Sharpe, gr. to H. LOVATT, Esq., was 2nd, both very well executed indeed. There were other classes for 200 feet groups, and the whole of them occupied a considerable space of ground.

The best six stove and greenhouse plants in the amateur's division came from Mr. H. Fewkes, gr. to T. CLAYTON, Esq., he having well grown and flowered examples; Mr. A. CRYER, Berrow Court Gardens, Edgbaston, was 2nd. Mr. Fewkes also had the best six exotic Ferns, and Mr. SHARPE came 2nd. *Caladiums* were in the form of nice well coloured specimens, and collections of *Begonias* were represented by good plants of the tuberous-rooted section.

Roses, &c.

The great centre of attraction at Wolverhampton is in the Rose tent. Roses are always presented to view at Wolverhampton in their best form. There were four exhibits of seventy-two blooms each, and some very fine blooms were staged. The veteran, Mr. B. R. CANT, of Colchester, held his own in this class, staging brilliant flowers, fresh, clean, and bright, chief among them Helen Keller, Catherine Mermet, Golden Gate, a lovely Tea; Gustave Piganeau, Madame de Watteville, Mrs. W. J. Grant, an imperial pink tint, exquisitely vivid; Auguste Rigotard, Prince Arthur, Charles Lefebvre, La Fraicheur, most attractive; Mrs. Paul, very fine; Ernest Metz, Charles Lefebvre, Marguerite Boudet, a delicate silvery white Bourbon; Countess, a lovely H.T., and old General Jacqueminot, in superb character, &c. Messrs. HARKNESS & SON, Bedale, were 2nd, with flowers a little larger in size, some of which lacked refinement; and Messrs. F. CANT & Co. were 3rd. Messrs. HARKNESS & Co. were 1st among competitors for forty-eight varieties. Messrs. F. CANT & Co. were 2nd, and Mr. B. R. CANT, 3rd.

In the class for eight distinct varieties, three blooms of each, Mr. B. R. CANT came in first, his finest blooms being Marchioness of Londonderry, Mrs. J. Laing, Ulrich Brunner, Helen Keller, and Mrs. W. J. Grant, the latter very fine. 2nd, Messrs. HARKNESS & SON; 3rd, Messrs. F. CANT & Co.

Messrs. J. TOWNSEND & SON, Coventry, had the best twenty-four varieties, very bright and fresh; Mr. J. MATTOCK, Oxford, was 2nd.

The class for twelve new varieties of the past three years, was full of interest, and here Messrs. FRANK CANT & Co. were 1st with charming blooms of Helen Keller, Ellen Drew, Countess of Caledon, Ethel Richardson, Lawrence Allen (a very good Rose), and Muriel Grahame, as the leading blooms. 2nd, Messrs. A. DICKSON & SONS, Newtownards, Belfast 3rd, Mr. B. R. CANT.

The best twelve blooms of a dark Rose were those of Gustave Piganeau, from Messrs. J. TOWNSEND & SON; Messrs. F. CANT & Co. were 2nd, with Horace Vernet.

The best twelve blooms of a light Rose were those of Mrs. J. Laing, from Mr. B. R. CANT; Messrs. A. DICKSON & SONS were 2nd, with Bessie Brown, an ivory-white of considerable promise.

The best collection of twelve Tea Roses came from Mr. J. MATTOCK, a very good collection; Messrs. FRANK CANT & Co. were 2nd.

The most decorative arrangement of Roses was a class which brought four exhibitors, the 1st prize going to Messrs. PERKINS & SONS, who presented the flowers to view in various ways, and made a very pleasing stand.

Other cut flowers were represented by very fine stands of stove and greenhouse species, Mr. J. CYPHER taking the lead, Orchids playing a very important part in these. There were also bouquets, the shower pattern prevailing, and here the chief honours went to Messrs. M. JENKINSON & SONS, Newcastle, Staffordshire, and Messrs. PERKINS & SONS, Coventry. An arrangement of hardy border flowers occupied a space of 36 feet, and brought some imposing banks of flowers, that of Messrs. W. F. GUNN & Co., Sunderland, won the 1st prize. It consisted of huge bunches of *Campanulas* and other hardy species of fine quality, arranged with considerable taste. Messrs. BARR & SON were 2nd. A good portion of a tent was occupied by dinner-tables, arranged for effect, that set up by Messrs. W. JENKINSON & SON, Newcastle, finding most favour with the judges.

There were classes for fancy Pansies, laced Pinks, and Carnations, in which some very good flowers were staged; one class which attracted a large amount of interest was for the most tasteful arrangement in Pansies and Violas. No class in the whole show caused so much difference among

the judges; and after a good deal of consideration Messrs. W. T. GUNN & Co. were placed 1st; Mr. GOODACRE 2nd; and Messrs. JONES BROS. 3rd. We considered the group placed last decidedly the best.

Mr. Henry Eckford's special prizes for Sweet Peas brought good collections of the leading varieties, set up in handsome bunches.

The Hawley Silver Challenge Cup, given for a display of plants and floral arrangements, was won for the third time by DICKSONS (LIMITED), Chester, and now becomes their property. It was a very fine display indeed, and not the least feature of interest was a tank of blooms of some of the fine varieties of *Nymphaea Mariacea*. Messrs. J. H. WHITE & Co. and others also set up fine collections.

FRUIT AND VEGETABLES.

Some very good fruit was staged. The best collection of nine dishes came from Mr. J. H. GOODACRE, Elvaston Castle Gardens, who had Black Hamburg and White Muscat Grapes, two fine dishes of Peaches, the same of Nectarines, a fine Queen Pine, a perfect dish of Lady Sudeley Apple, Melon, and Strawberries. Mr. T. BANNERMAN, Blithfield Gardens, Rugeley, was 2nd.

Mr. GOODACRE had the best four bunches of Grapes, having Gros Maroc, Black Hamburg, Muscat Hamburg, and Madresfield Court, all well finished. Mr. J. Read, gr. to Lord CARNARVON, was 2nd.

The best two bunches of white Grapes was Muscat of Alexandria from Mr. T. JORDAN, The Gardens, Impney Hall. Mr. GOODACRE had the best two bunches of black Grapes, having a finely finished Muscat Hamburg.

A very fine dish of Royal George Peaches won the 1st prize for Mr. BARNES, Eaton Hall Gardens, had the best dish of Nectarines, staging splendid Elruge. Strawberries in three and also in one dish were finely shown. There were several Melons, but they appeared to lack flavour; and there were also good Tomatoes, in red and yellow varieties.

In response to the special prizes offered by Messrs. Sutton & Sons, Webb & Sons, and Messrs. Dobbie & Co., excellent collections of vegetables were staged; and, the season considered, they were also in good character in the amateurs' and cottagers' divisions.

NON-COMPETITIVE EXHIBITS.

A very large number of miscellaneous contributions of plants and flowers was staged by various exhibitors, and occupied a considerable space of tabling. Mr. HENRY ECKFORD set up a remarkable collection of Sweet Peas; Messrs. J. PEED & SONS, Norwood, had a large ground group of Caladiums, and also one of Begonias; Messrs. J. LAING & SONS, Forest Hill, contributed some of their fine strain of Begonias; Mr. HENRY DEVERILL, Banbury, had a very fine bank of cut flowers; and so had Messrs. WEBB & SONS, who added vegetables in considerable variety; Messrs. W. & J. BIRKENHEAD had a table of Ferns; Messrs. HEWITT & Co., and T. B. THOMSON & Co., both of Birmingham, contributed cut flowers, &c., and several others also.

DURHAM, NORTHUMBERLAND, AND NEWCASTLE-UPON-TYNE BOTANICAL AND HORTICULTURAL.

JULY 13, 14, 15.—The annual show of the above Society was held on the above dates in the Recreation Ground, North Road, Newcastle, and the Committee is to be congratulated on a very fine show, although in many respects not very extensive; still, nearly everything shown was of good quality, with the exception of the groups, in which, although there were four entries, there seemed throughout to be a lack of quality and finish.

The arrangements of the exhibits are excellent, and the idea of having the three tents merged into one is a very commendable one, as, while being easier of access, it admits more air, and the oppressive feeling so often experienced was entirely absent.

This year the Society, being honoured with a deputation from the Royal Horticultural Society, seemed to have made a special effort, and the result certainly justified it, as it was the opinion of visitors that never had a greater number of people been present than on the opening day.

Groups.—On entering by the main opening, the group of Messrs. W. FELL & Co., of Hexham, on the right, at once attracted attention. It contained good Conifers, and was interspersed with herbaceous flowers, in the centre being a small but choice lot of greenhouse plants. On the opposite side, Messrs. ROBSON & SONS, of Hexham, had staged a pleasing exhibit, comprising good varieties of Conifers, dotted among which were Maples, the whole faced with *Euonymus*, *Periwinkle*, and other dwarf plants. In the centre of the opening bay were arranged the specimen flowering plants, but these were not so fine as one would expect at this show.

Among groups staged not for competition, the following were noteworthy:—A fine group of Malmesbury Carnations, exhibited by Mr. Goodacre, gr. to Lord HARRINGTON, of Elvaston Castle, Derby; also a small but choice collection of Carnations from Messrs. LAING & MATHER, of Kelso.

Undoubtedly one of the premier exhibits of the show was the very excellent group of choice plants staged by Messrs. JAS. VEITCH & SON, Ltd., of Chelsea, for which the firm were awarded a Gold Medal by the Royal Horticultural Society. The group contained many examples of well-grown plants, including splendidly coloured Crotons, very charming Caladiums, a nice lot of *Rhododendron javanicum* varieties,

also Carnations, an excellent *Crassula* (*Kalosanthes*), and a good pink Carnation named *Exile*; exquisite Orchids, and charming pans of Veitch's Lily of the Valley.

Following this was a good representative bank of Cannas from Messrs. H. CANNELL & SON, Swanley (Silver Flora Medal, R.H.S.), containing large spikes of Burbank, Flamingo, Amiral Avelan, Souvenir de Antoine Crozy, &c.

Messrs. W. PAUL & SONS, of Waltham Cross, filled a space of 25 feet with hand-cut Roses, arranged in large hampers, and forming quite a blaze of colour. They showed among other fine blooms of Mrs. John Laing, Gloire Lyonnaise, Merveille de Lyon, Ethel Brownlow, W. A. Richardson, and Marie Van Houtte. Among the new varieties were noted Milton, Tynnyson, a rich flesh-coloured variety of good form; Exquisite, Aurora, and Waltham Standard. With a little more furnishing, this would have been much more effective (Silver-gilt Flora Medal).

Messrs. JAS. BACKHOUSE & SON, Ltd., of York, had a charming arrangement of Alpine plants on a miniature rockery, which at once attracted the eye, the tiny gems being so naturally placed as to quite make one imagine they had actually grown on the rockery. Included in the collection were good examples of the Poppy-like flowered *Romneya Coulteri*, a charming Californian plant. The same firm also staged a group of stove and greenhouse plants and Orchids, including good *Cattleya Mossiae* Mendeli, *Odontoglossum crispum*, *Todea superba*, *Ixoras*, *Gleichenias*, also a very charming *Begonia*, with brilliant scarlet flowers, named *Phosphorescens*; and a new *Croton*, *Lady Deramore*. On the front were arranged same tubs of *Nymphaeas* which, although not open in flower, still showed the style of cultivation (Silver-gilt Flora Medal).

Messrs. LITTLE & BALLANTYNE, Carlisle, staged a nice group of stove and greenhouse plants, including purple-leaved Vines, and *Acalypha Sanderiana*. Messrs. Little & Ballantyne received a First-class Certificate for Holly, Golden King.

Mr. JOHN FORBES, of Hawick, had a magnificent collection of Phloxes, Pentstemons and Delphiniums, and all agreed that they were remarkably fine, and the Royal Horticultural Society awarded to this exhibit a Silver Flora Medal.

Messrs. WALLACE & Co., Colchester, exhibited a very representative collection of Lilliums and Calochortus, also the charming *Hemerocallis aurantiaca* major, *Lilium Thunbergi* Horsmanni, dark purple; and *L. Thunbergi* var. *Alice Wilson*, a pleasing yellow (Silver Banksian Medal).

Mr. HUDSON, gr. to LEO, ROTHSCHILD, Esq., Gunnersbury, exhibited, not for competition, a charming lot of *Nymphaeas*, including *N. Mariacea rubra punctata*, *Chromatella Mariacea*, rosea, *Mariacea alba*, alba rosea, *Andreana*, odorata, rosea, all cut from the open air (Silver Banksian Medal).

Mr. JAS. DOUGLAS, Edenside, Bookham, had a nice collection of named Carnations, including Churchwarden, Nell Gwynne, Prime Minister, and Lady Grimston.

Messrs. COCKER & SONS, of Aberdeen, staged in vases a magnificent group of Spanish Iris of various colours at the end of the fruit department, and were awarded by the Royal Horticultural Society a Silver Flora Medal. In the other groups there was nothing noteworthy. The 1st prize went to Mr. McIntyre (Mrs. G. PEASE, Darlington), whose group, while being tastefully arranged, lacked quality. 2nd, R. O. LAMB, Esq. (gr., Mr. Farquharson), who had a nice group that was somewhat lacking in colour. 3rd, Mrs. JENNINGS, Haymarket Newcastle.

Fire place decoration.—In this class the 1st prize was taken by J. BATTENBY, Esq., Blagdon; 2nd, Mrs. B. JENNINGS.

Specimen plants were not extensively shown, the prizes being taken by the Marquis of ZETLAND, Mrs. JENNINGS, and J. B. CLAYTON, Esq.

CUT ROSES, &c.

made a grand display, the premier awards in every case going to Messrs. HARKNESS, of Bedale, which firm showed in excellent form in the class for seventy-two varieties. Messrs. Harkness showed good blooms of *La France*, Alfred Colomb, Jeannie Dickson, White Lady, Ulrich Brunner, Lady Mary Fitzwilliam, &c. The 2nd prize went to Messrs. L. & W. CROLL, Dundee, who had good *Innocente Pirola*, Jeannie Dickson, Mrs. R. S. Crawford, &c., and the 3rd to Messrs. G. & W. BURCH, Peterborough.

In forty-eight varieties, 1st, Messrs. HARKNESS & SON; 2nd, Messrs. R. MACK & SON.

In thirty-six varieties, 1st, Messrs. HARKNESS & SON; 2nd, Messrs. CROLL, all good exhibits.

Twelve Roses, one variety, 1st, Messrs. HARKNESS & SON, Bedale, who showed very fine blooms of Mrs. John Laing (Silver Banksian Medal); 2nd, Messrs. R. MACK & SON.

In the smaller classes the prizes were taken by W. HUTCHINSON, Esq., of Kirby Moorside, and R. PARK, Esq.

One of the most charming displays of the show were the tables of Roses arranged for effect. In this class the 1st prize was given to Messrs. PERKINS, of Coventry, who showed a charming arrangement; the 1st prize lot of Messrs. CROLL, of Dundee, was also most meritorious. All of these were very excellent.

In cut herbaceous blooms, a very charming display was presented, and Messrs. COCKER, of Aberdeen, certainly staged very fine exhibits, the general opinion being that they were the finest ever seen in the North.

Herbaceous Plants.—For twenty-four bunches, 1st, Messrs. COCKER & SON, showing good bunches of *Heuchera sanguinea*, *Helenium Bolanderi*, *Paeonia festiva*, *Iris Leander*, *I. Blue Emperor*, *Lilium Harrisii*, &c.; 2nd, Messrs. HARKNESS & SON, Bedale; 3rd, Mr. EDMONDSON, Newcastle.

Eighteen bunches, 1st, Messrs. COCKER & SON; 2nd, Messrs. HARKNESS & SON, who received for this a Bronze Flora Medal. All the other exhibits in these classes were very excellent.

Cut flowers formed very choice exhibits, and in bouquets and baskets of flowers the competition was very keen by Messrs. PERKINS & SON, of Coventry, Mr. EDMONDSON, of Newcastle, and Mrs. JENNINGS.

FRUIT.

For the premier collection of eight dishes the competition was keen, and five collections were staged. The 1st prize was awarded to Mr. J. H. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby, the following being the kinds and varieties: Black Hamburg Grapes, Canon Hall Muscat, Lord Napier Nectarine, very fine; Countess Melon, Barrington Peach, brown Turkey Fig, red Australian Apple, and a Queen Pine-apple. Mr. McIndoe, gr. to Sir JOSEPH PEASE, Hutton Hall, Guisborough, was 2nd, his best dishes were Madresfield Court and Chassela, Napoleon Grapes; 3rd, Mr. J. Tullet, gr. to Lord BARNARD, Raby Castle, Staindrop.

In the four dishes of fruit competition, the premier position was taken by Mr. GOODACRE, the veteran exhibitor of Elvaston Castle gardens, with fruits very excellent in every point; the 2nd place falling to Mr. J. McINDOE; and the 3rd to Mr. G. Lonsdale, gr. to R. H. APPLETON, Esq., Woodside Hall.

The best four bunches of Grapes were shown by Mr. GOODACRE, who staged well-finished bunches of Madresfield Court and Muscat Hamburg; 2nd, Mr. McINDOE, with nice bunches of Chassela Napoleon, Muscat of Alexandria, and Madresfield Court; 3rd, Mr. TULLET.

The best two bunches of Grapes, viz., Muscat of Alexandria, were shown by Mr. R. Strickland, gr. to T. W. BACKHOUSE, Esq., West Haddon House, Sunderland, whose Frontignans were well finished; 2nd, Mr. McINDOE, gr. Hutton Hall, with Muscat of Alexandria.

The best two bunches of Black Hamburg Grapes were those shown by Mr. GOODACRE; nd, Mr. LONSDALE.

For the best two bunches of any other kind of Grape, the prizes went to Mr. McINDOE, 1st, with well-finished Madresfield Court; and to Mr. GOODACRE, 2nd.

VEGETABLES.

Special prizes were offered for collections of vegetables, nine distinct kinds, by Messrs. SUTTON & SONS, Reading, the prize being taken by Mr. J. McINDOE, of Hutton Hall, to whom the 1st prize of Messrs. WEBB & SONS, Stourbridge, was awarded for a collection of six kinds. These were the only collections shown.

The Deputation from the Royal Horticultural Society consisted of Sir Trevor Lawrence, Bart, the President of the Society; the Rev. W. Wilks, Secretary; Philip Crowley, Esq., Treasurer, and Messrs. C. E. Shea, T. Statter, A. H. Pearson, J. Wright, G. Yeld, A. Turner, and J. O'Brien.

Most of the members left Kings Cross by the 2.20 p.m. train on Tuesday, arriving at Newcastle-on-Tyne in time for the dinner at the Central Station Hotel at 8.45. An excellent dinner was provided, and the deputation was heartily welcomed by the President of the Durham, Northumberland, and Newcastle Botanical and Horticultural Society, Riley Lord, Esq., J.P.; Alderman J. B. Ellis, J.P., Chairman; Benjamin Plummer, Esq., Vice-Chairman; Councillor John Armorer Baty, Treasurer; and J. J. Gillespie, jun., A.C.A., M.A., LL.D., Secretary; and among the other members of the Council present to welcome the deputation were:—Councillor John Beattie, Councillor J. J. Gillespie, Councillor Alfred Fox, and Messrs. J. T. Corking, J. Dick, J. D. Garland, G. Todd, J. B. Reid, T. G. Morpeth, and Councillor Alexander Hepburn. Sir Trevor Lawrence was unavoidably absent, having appointed to meet the deputation in the show ground in the morning.

After dinner, and the toast of Her Majesty the Queen had been duly honoured, Mr. Riley Lord, on behalf of the Society, in a very warm and kindly speech, welcomed the deputation. Mr. Riley Lord said they felt honoured by the visit, and he hoped and believed that the members of the deputation who had kindly come such a long distance to further the interests of horticulture would not be disappointed by what they would see on the morrow. Those who had undertaken the arrangements had worked hard, and he thought they had secured a show far in advance of anything which had been held in Newcastle before, and perhaps second to none outside of London. All they wanted was fine weather, which they had so often failed to get, that bad weather was associated in the minds of the Newcastle people with the show. He hoped on this occasion the weather would be fine, and that they would not have a recurrence of the calamity of 1891, when the tents were blown down, and the Society almost ruined. But they ought not to grieve over that calamity, for out of it came renewed energy, and with the aid of hard workers and liberal friends, the Society may be said to have been re-established on a better basis from that time. He proposed "the health of the Royal Horticultural Society, coupling with it the name of Mr. Philip Crowley."

Mr. CROWLEY said he was pleased to see displayed such interest in horticulture, and to get such evidence of the vigour and vitality of the Society they were deputed to visit, as was shown in the President's remarks relating to its troubles, and the ultimate victory over them. The Royal Horticultural Society had also had its ups and downs, and he mainly attributed its present position to the fact that it had consistently adhered to horticulture, and to the spread of the knowledge of it. Years ago the Society sent collectors abroad, to whose labours our gardens were indebted for many excellent plants; but in recent years nurserymen had taken up the work, and therefore there was now no need for the Society to continue such ventures. In proof of the vigour of the Royal Horticultural Society, he

should state that already this year they had the record number of new Fellows, and he had no doubt the work of the Society at its fortnightly meetings, the Great Temple Show, and the Crystal Palace Fruit Show under the auspices of the Society, were doing great good to Horticulture. He thanked the President for the kind reception given the deputation.

The toast of the health of the Secretary of the Royal Horticultural Society being given, the Rev. W. Wilks said that the deputation was one of Horticulture, and they were not orators. They did not come to make speeches, but to gauge the results of the efforts made on behalf of Horticulture at Newcastle-on-Tyne. Sir Trevor Lawrence would address them to-morrow, and therefore he would not occupy their time. He proposed the health of the Durham, Northumberland, and Newcastle Horticultural Society, coupling with it the name of Alderman Ellis, the Chairman of the Society. Alderman Ellis said he was sure the Council appreciated the honour of the visit from the Royal Horticultural Society, and he praised in high terms the different members of the Council who had worked so hard to bring about the present fine show, which he hoped, with the aid of fine weather, would be a great success in every way.

The toasts of Mr. Gillespie, the Secretary, that of Mr. J. A. Buty, Treasurer, and of Mr. Benjamin Plummer, Vice-Chairman, having been duly honoured, the party broke up shortly after 11 P.M.

The following is a list of the Awards made by the Deputation, and the names of the recipients.

GOLD MEDAL.

To Messrs. Jas. Voitch & Sons, Chelsea, London, for a grand group of rare plants, Orchids, &c.

SILVER-GILT FLORA MEDAL.

To Messrs. Wm. Paul & Sons, Waltham Cross, for an extensive collection of cut Roses.

To Messrs. Jas. Backhouse & Son, York, for a pretty group of Alpines, and a collection of miscellaneous plants.

To Mr. John Forbes, Hawick, Scotland, for a grand display of Pentstemons, Phloxes, and Delphiniums.

SILVER-GILT BANKSIAN MEDAL.

To Messrs. Wallace & Co., Colchester, for a fine collection of Lilies, Calochorti, &c.

SILVER FLORA MEDALS.

To Messrs. Perkins & Son, Coventry for a pretty group of Roses with foliage.

To Messrs. H. Cannell & Sons, Swanley, for a very fine group of Cannas.

To Mr. John McIntyre (gr. to Mrs. Gurney Pease), for a fine group arranged for effect.

To Messrs. J. Cocker & Sons, Aberdeen, for grand group of Spanish and English Iris.

To J. Cocker & Son, Aberdeen, for herbaceous plants.

SILVER BANKSIAN MEDALS.

To Mr. S. Pye, Bowgrave Nursery, Garstang, for a fine lot of Violas and Pansies.

To Messrs. Harkness & Son, Bedal, for a fine stand of Rose Mrs. John Laing.

To Leopold de Rothschild, Esq. (gr. to Mr. J. Hudson), for Water Lilies.

To Mr. A. Lister, Pothesay, for Violas.

To Sir James Pease, M.P. (gr. to Mr. McIndoe), for a fine stand of fruit.

BRONZE FLORA MEDAL.

To Messrs. Harkness & Sons, for herbaceous plants.

FIRST-CLASS CERTIFICATE.

To Holly Golden King, from Messrs. Little & Ballantyne.

WOBURN EXPERIMENTAL FRUIT-FARM.—At the invitation of the Duke of Bedford and Mr. SPENCER PICKERING, F.R.S., the Director, a party of horticulturists visited the experimental farm at Ridgmont on Wednesday last. Mr. PICKERING explained the objects of the experiments as formerly detailed in these columns. The fruit-trees have grown well since we saw them some two years ago. Strawberry-picking was proceeding vigorously, and of the kinds grown the Countess was pronounced the best. The object-lessons furnished by some of the experiments were very striking, particularly those showing the difference between growing fruit-trees with or without grass, the advantage being manifestly with those where the soil was free from grass. Cox's Orange Apple had done remarkably well, but many of the Plums were blighted. Superlative Raspberry justified its name. For the most part the ground is closely cropped with small trees with bush-fruit beneath. Hitherto the use of manures, whether natural or artificial, has proved of little or no advantage, but time will show how long this condition of affairs will last. One very beautiful feature consisted in the very long rows of Sweet Williams for cutting. Mr. CASTLE, the manager, has a fine strain, and the

display was truly magnificent. In the afternoon the party visited the Park, and admired the noble trees, and the herds of deer from all parts of the world. They were also conducted through the exceedingly interesting picture galleries, the sculpture hall, the grotto, and the Chinese dairy. The bedding-out is good of its kind, but the elaborate patterns and coloured sands looked out of place by the side of the mansion. A rocky border, on the other hand, was generally admired. In an experimental garden like this we must wait for some years for trustworthy results.

THE ROSARY.

NEW ROSES.

Messrs. ALEXANDER DICKSON & SONS, of Newtownards, co. Down, send us coloured illustrations of their new Roses:—Killarney, H.T., with the colour of the old China Rose; Daisy, similar but of darker pink; Ard's Rover, H.P., regularly formed, rich crimson; Meta, T., with elongated slender buds and petals, with reddish streaks on a yellow ground; Beryl, a small-flowered yellow Rose, with recurved petals of great beauty.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 9, is furnished from the Meteorological Office:—

"The weather during this week was fine and dry in nearly all parts of the kingdom. In the extreme north and north-west, however, unsettled, rainy conditions prevailed during the earlier half of the period.

"The temperature was a little below the mean in all districts, but just equalled it in 'Ireland, S.' and the 'Channel Islands.' The highest of the maxima, which were registered either on the 6th or 7th, ranged from 79° in 'England, S.' and 78° in 'England, S.W.' to 78° in 'Scotland, W.' and 72°

in the 'Channel Islands.' At the end of the week the daily maxima were very low over the eastern parts of England. The lowest of the minima were recorded during the earlier days of the week, and ranged from 37° in 'Scotland, E.,' 'Ireland, N.,' and 'England, S.W.' to 44° in 'England, N.E.,' 'N.W.,' and 'S.' and to 49° in the 'Channel Islands.'

"The rainfall just equalled the normal amount in 'Scotland, N.,' but was less in all other districts. In most parts of England and Ireland the fall was extremely slight, and in several localities there was no rain at all.

"The bright sunshine exceeded the mean over the kingdom as a whole, especially in 'England, S.W.' and the 'Channel Islands,' but only just equalled it in 'Scotland, N.' and 'England, E.' The percentage of the possible duration ranged from 83 in the 'Channel Islands,' 76 in 'England, S.W.,' and 56 in 'Ireland, S.' to 47 in 'England, S. and N.W.,' 39 in 'England, E.,' and to 28 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, JULY 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Large supplies all round, and prices generally low. The Gooseberries are now changing colour—note the yellow and red above quoted. Raspberries are now coming along fast. The Cherries are coming in very good condition. The bulk of Strawberries are the Royal Sovereign and Paxtons. Pea trade is very slow, and the Broad Windsor Bean is at its best. The Bedford Potatoes look healthy. Note the price of Carrots; they are now good eating.

POTATOS.

Home grown, Myatts, 120s. to 160s.; others, 80s. to 100s. per ton. John Bath, 92 and 94, Wellington Street, Covent Garden.

FRUIT AND VEGETABLES.

GLASGOW: July 13.—The following are the averages of the prices at this market during the past week:—Apples, Canadian Spy, 24s. to 26s. per barrel; ditto, Russets, 24s. ditto; ditto, Western States (Winesops), 20s. to 22s. do.; ditto, Russets, 18s. ditto; Tomatos, Guernsey, 6d. to 7d. per lb.; Grapes, home, 3s. 6d. to 4s. 6d. per lb.; ditto, foreign, 6d. to 1s. ditto; Gooseberries, 3s. 6d. to 4s. per stone; spring Cabbages, 7d. to 10d. per dozen; Cauliflowers, Dublin, 2s. 6d. do.; Herbs, 1d. to 2d. per bunch; Mint, green, 6d. to 9d. do.; Onions, 5s. 6d. per cwt.; do., Portugal, 14s. to 15s. per case; Parsley, 2s. per stone; Potatos, 1s. do. (best); Carrots, 8s. to 10s. per cwt.; Peas, 4d. to 5d. per lb.; Cucumbers, 3d. to 6d. each; Lettuces, round, 6d. to 9d. per dozen; do., Cos, 6d. to 1s. do.; Radishes, 9d. to 1s. 6d. per dozen bunches; Horse-radish, 1s. 6d. per bundle; Mushrooms, 1s. to 1s. 2d. per lb.; Beet-roots, 7d. to 8d. per dozen; Spinach, 1s. 6d. to 2s. per stone; Rhubarb, 2s. 6d. to 3s. per cwt.; Turnips, white, 7d. to 9d. per large bunch; Broccoli, 1s. 6d. to 2s. per dozen; Greens, 2s. per ten dozen; Asparagus, 1s. 6d. to 2s. p bunch; Sytoes, 6d. per bunch.

LIVERPOOL: July 13.—Average of the prices at undernoted markets:—St. John's: Potatos, 1s. 4d. to 1s. 8d. per pec; Peas, 1s. 2d. to 1s. 4d. do.; Asparagus, 2s. 6d. to 3s. per 100; Cucumbers, 4d. to 6d. each; Strawberries, English, 6d. to 8d. per qt.; Gooseberries, 3d. per lb.; Cherries, 4d. to 6d. do.; Apricots, 1s. per dozen; Currants, 6d. per lb.; do., red, 6d. do.; Grapes, home, 2s. 6d. to 3s. 4d. do.; Pines, 5s. each; Mushrooms, 1s. 4d. per lb. Birkenhead: Potatos, 1s. 4d. to 1s. 6d. per peck; Peas, 10d. to 1s. 4d. do.; Cucumbers, 2d. to 4d. each; Apricots, 9d. to 1s. per dozen; Gooseberries, 1½d. to 3d. per lb.; Cherries 6d. to 8d. do.; Strawberries, 4d. to 8d. do.; Currants, red, 6d. do.; do., black, 6d. to 8d. do.; Grapes, English, 2s. to 3s. 6d. do.; Mushrooms, 6d. to 8d. do. North Hay: Potatos, Early Regents, 4s. to 5s. per cwt.; do., new, per 21 lb., 1s. 3d. to 1s. 6d.; Kidneys, 5s. to 6s. per cwt.; Turnips, 6d. to 8d. per dozen bunches; Carrots, 6d. to 8d. do.; Onions, foreign, 6s. to 6s. 6d. per cwt.; Parsley, 4d. to 5d. per dozen bunches; Lettuces, 6d. to 8d. per dozen; Cucumbers, 1s. to 2s. do.; Cauliflowers, 1s. 9d. to 2s. 6d. do.; Cabbage, 4d. to 10d. do. Peas, 2s. 4d. to 2s. 6d. per bushel.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending July 9, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.
	s. d.	s. d.	s. d.
Wheat	27 4	36 10	+ 9 6
Barley	17 4	25 0	+ 7 8
Oats	18 8	20 5	+ 1 9

SEEDS.

LONDON: July 13.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that as was expected, to-day's seed-market was thinly attended, and presented no feature either of interest or novelty. Some of the samples which come to hand of the new French Trifolium show disappointing quality. Occasional small sowing orders drop in for Mustard and Rapeseed. As regards Clover-seed there is no business passing, whilst for

Birdseeds the sale is also meagre. Blue Peas and Haricot Beans move off slowly on former terms; Buckwheat is dearer. The Board of Trade returns gives the imports of Clover and Grass-seeds into the United Kingdom for the first six months of this year as 219,869 cwt., value £424,235, as against 178,298 cwt., value £361,594, for the corresponding period of 1897.

ENQUIRY.

"He that questioneth much shall learn much.—BACON."

CAN any reader give me any information as to the plant to which the term "Lily of Jorow" is applied? The plant is described as being a native of the back woods of America, and as having a flower of a blue colour, and highly scented. *Tt.*

A SITUATION ON A TEA OR COFFEE-GROWING ESTATE: *Scotchman.* We do not know a better way of obtaining the situation you require than to advertise in the *Times*, *Times of India*, *Ceylon Advertiser* (published in Colombo), or the *Planter's Gazette*, published at 32, Fenchurch Street.

A SWEET BRIAR MAZE: *A. R.* It would be advisable to employ stakes, say, of half-inch round bar iron. If the plants are closely cut-in annually, as they must be, an almost impenetrable hedge will grow up. Longitudinal wires might be stretched from stake to stake, to which the growths might be fastened.

BEGONIA GLOIRE DE LORRAINE WITH YELLOW LEAVES: *Anxious.* It may be rust due to a fungus. Kindly forward a few leaves for inspection.

CANTERBURY BELL: *Bertram Jones.*—The kind of Hose-in-Hose flower, erroneously called a "double"-flowered variety, is now become in a great measure constant, and seeds from trustworthy sources can be guaranteed to produce a very large percentage of plants bearing flowers of this description.

CARNATION: *H. & S.* Your Carnation is most beautiful. We do not remember to have seen one so clear and bright a rose colour. The petals are large, and good form also, but being not too numerous, the calyx does not split.

CORRECTION—BATH SHOW. The medal for the best Tea Rose in the Amateur's Classes was won by Mr. A. Hill Gray with Maman Cochet, and not with Hybrid Tea Caroline Testout, as was unfortunately stated in our report of the same.

FIGS: *E. S. G.* The affected fruits are the result of check from some means. Probably there has been insufficient care exercised in the matter of ventilation during the cold winds a fortnight ago. All you can do is to prevent any check occurring to the trees.

FRUIT TREES ON A WALL: *E. M. C.* The shoots are infested with aphids, that can be annihilated by spraying with kerosene emulsion, or with tobacco-water, or Quassia-water, in which a little soft-soap is dissolved. Probably several applications at short intervals will be necessary.

FRUIT-TREE PLANTING, &c.: *Hortus.*—The quincunx method is the best, letting the trees stand at an equal distance apart. Garden crops and bush fruit should be planted in lines running north by south.

GARDEN: *H. K. G.* A piece of land, partly shaded by big trees, and only measuring 63 square rods, would not supply an establishment of twelve persons throughout the year with vegetables and salads, although it might, if continuously cropped, afford what was wanted exclusive of Peas, Potatos, and Asparagus.

GRAPES ON A RECENTLY-REMOVED VINE: *Regular.* Most of the bunches should be removed, as to retain them would have a detrimental effect upon the Vine.

INSECT FEEDING ON APHIS: *J. S. & Sons.* The larvæ of the Ladybird—*Coccinella ocellata*.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*J. M. D.* *Spiræa prunifolia* fl. pleno, and *S. hypericifolia*, small leaves.—*J. Wood, Kirkstall.* *Ageratum conyzoides*, apparently artificially scented with "Cherry blossom."—*N. E. B.*—*P. F.* Probably an *Alpinia* or *Hedychium*, send when in flower; 2, *Arundinaria* (*Bambusa*) *Simoni aurea*; 3, *Colutea arborescens*.—*R. N. H.* The spotted flower is a form of *Odontoglossum Andersonianum*; the brown, *Oncidium prætextum*. Both are good varieties. — *W. T. B.* 1, *Pteris Adiantoides*; 2, *Lastrea filix-mas* var.; 3, *Lygodium japonicum* (scandens); 4, *Selaginella Wildevonii*; 5, *Asplenium viviparum*; 6, *Inula glandulosa*; 7, *Hemerocallis flava*.—*Young Gardener.* 1, *Adiantum concinnum latum*; 2, *Woodwardia radicans*; 5, *Magnolia Lenne*; 6, *Polemonium coruleum*, white form; 7, *Valeriana officinalis*. We cannot name the garden varieties of *Begonia*.—*W. T.* *Hyoscyamus niger* (common Henbane, and decidedly poisonous).—*A.* *Ophrys apifera*.—*W. T.* To name your Roses it is necessary they should be compared with a true collection. Send them to some Rose nurseryman.—*L. P.* *Prunella vulgaris*; 1, *Aira caryophylla*; 2, *Agrostis alba*; 3, *Bromus sterilis*; 4, *Holcus lanatus*; 5, *Avena flavescens*; 6, *Poa nemoralis*; 7, *Arrhenatherum avenaceum*.—*J. E. C.* *Pyrus Aria*, white Beam; *Campanula persicifolia*; *Campanula latifolia*.—*G. B.* *Belladonna Lily*, *Amaryllis Belladonna*.—*Samuel Ray.* *Alonsoa incisa*, so far as we can tell from a shrivelled scrap.—*C. A. B.* 1, *Inula helenium*; 2, *Centaurea montana*; 3, *Coreopsis latifolia*; 4, *Orchis maculata*; 5, *Lythrum salicaria*.

PEAR LEAVES WITH ORANGE-COLOURED SPOTS: *W. R. G.* The rust fungus, *Stigmataea Mespili*. The remedy recommended for other minute species of fungi, viz., sulphide of potassium or the Bordeaux Mixture, often mentioned in recent issues of the *Gardeners' Chronicle*, may be used. If nothing be done, the spots will coalesce, and the leaves turn brown and fall off. All the fallen leaves should be collected and burned.

PURPLE BEECH: *In Doubt.* The leaves are infested with chermes, and we fear there is no method known by which a large tree can be cleared of the lice, unless you could wash it with a fire-engine, using tobacco-water mixed with strong soap-suds. The ants you notice come for the honey-dew, the exudations of the chermes. Left alone, the mites may kill the tree.

REMOVAL OF TREES, SHRUBS, AND SALEABLE PLANTS BY NURSERYMEN, &c.: *G. B.* No new Act of Parliament. The trader is allowed to remove all saleable stock, but anything larger than this can be claimed by the landlord if no agreement exists to the contrary. He is also allowed a reasonable period of time in which to shift the plants, which is decided by the trade custom of the locality.

SEEDS AND PLANTS AT ROYAL GARDENS, KEW: *Amateur.* We are unable to answer your enquiries. The species of Lilies named in your note are suitable for the greenhouse or the open air.

TWELVE VARIETIES OF PEARS SUITABLE FOR THE NORTH: *W. H. B.* *Jargonelle*, *Beurré d'Amanlis*, *Louise Bonne de Jersey*, *Doyenné du Comice*, *Marie Louise*, *Beurré Bosc*, *Beurré d'Aremberg*, *Winter Nelis*, *Easter Beurré*, *Glout Morcéaux*, *Doyenné d'Ete*, *Williams' Bon Chrétien*, and *Swan's Egg*.

COMMUNICATIONS RECEIVED: *G. H. R.*—*H. H. D.*—*T. B.*—*W. H. W.*—*J. L.*—*E. G. H.*—*W. B.*—*Hans R. W.*—*J. A.*—*W. B. Crump*.—*F. W. B.*—*G. Woodward*.—*H. C.*—*B. C.*, South Shields. — *B. S. H.*—*C. W.*—*W. S.*, Exmouth. — *W. L.*—*E. Stewart*.—*A. J. L.*

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE Gardeners' Chronicle.

SATURDAY, JULY 23, 1898.

QUAINT CONCEITS IN OLD HERBALS.

HAVING had occasion to study old herbals in connection with transcriptions from MSS. of medical works of the fourteenth Century, about to be published, I thought a few odd descriptions, &c., might interest readers of the *Gardeners' Chronicle*. I have, e.g., an Italian herbal by Castore Durante, 1636 A.D., published just thirty-nine years after Gerarde's, in 1597. Each plant has its peculiarities recorded in Latin hexameters, but the "form," "place," "quality," &c., are in Italian. The plants are arranged alphabetically, each having a curious little woodcut adjoined. The following are a few taken as examples:—

AMONIMUS.—This appears to be *Oxalis sensitiva*. A hand is represented as grasping a leaf, which has crumpled itself up. "Wonderful is the nature of this plant; if touched by the hand, the leaf, which is like the Polypody, immediately withdraws itself. It comes from Malavar."

ARBOR TRISTIS.—"There was a nymph who loved the sun, but complained that he preferred another; overcome with chagrin, she adopted the form of a tree, which flowered only at night, so that the sun should never see the blossoms. The flower is yellow, and a water distilled from it is good for the eyes." The illustration is that of a Stinging-nettle, the main trunk issues out of the nape of the nymph's neck, while her arms form two side, leafy branches. Her legs form a sort of divided trunk, the feet having turned into roots. The moon and stars are above in a cloudy sky.

BAARAS.—In Daubeny's *Roman Husbandry* there is a reproduction of a drawing of the Mandrake, attached to the Vienna MS. of Dioscorides' writings, of the fifth century. In it the Goddess of Discovery is telling him how this plant is to be got. She is offering him one, having a crown of foliage above, with a human body below; with her left hand she points to a dog with a twisted tail, writhing on the ground in the last agony of death. Josephus tells us how the Mandrake was extracted; and our present author supplies a drawing of the actual process. He first describes the "Baaras" as "having leaves like flames, which shine in the evening like a brilliant star. The root cannot be extracted by mere strength, for it retires into the ground if any one tries to pull it up." To obtain it, the plant must first be dosed with what must not be written for eyes polite. You must tie the tail of your dog to the crown. "The faithful animal, who will follow his master through fire and swords, rushes after him, and so drags the plant out of the ground; but alas! he breathes his last; however, he has saved his master from every danger, for whoever is vexed with a demon and cannot be

healed by human skill, let the root be placed upon him, and the demon will go."

The author adds:—"Some impostors have falsely attributed all these things to the Mandrake, by whom the whole world is deceived." But if Baaras be not the Mandrake, what was it? The Mandrake itself is elsewhere described, but nothing peculiar is said about it.

LUNARIA MINOR.—This appears to be *Hippocrepis*, or some other leguminous herb, with horseshoe-like divisions to the pod. Perspective is not regarded in these illustrations, for a horse in the foreground is prancing about, having cast two fore-shoes; but the herb is drawn just four times its height! The peculiarity of this little herb was, that it made horses shed their shoes.

JOB'S TEARS.—"A wonderful plant, which sheds tears, and supplies us with chaplets (i.e., rosaries) for praying with. Hence it is certain that the Powers can be invoked by our vows and prayers, accompanied with these tears!"

SILICUASTRUM.—"This has the name of Judas, and also the name of Love. No part of the tree is used in medicine." The illustration gives a stump (for brevity) bearing one bough, with leaves and pods; and another bough, cut short, having Judas himself suspended thereon.

SMILACE.—"The Yew has deadly poison. It will become harmless if a brass-nail be driven into its trunk; otherwise, it will kill anyone who dares sleep under its shade. It kills mice and oxen with its vapour. If you should eat out of vessels made of it, you will run terrible risks. It chills the whole body, and chokes those drinking, although it is a 'hot' plant." The drawing shows a man with a sword and a matchlock gun, recumbent beneath, but whether he is alive or dead is not apparent.

In an appendix of nineteen pages, each having six illustrations, with names only, there occurs, "The tree with the walking leaves." This is a tree with large boughs, covered with oval crenated leaves, having what look like insects' legs at the crenatures, two on each side, i.e., in four places. One leaf is falling from the tree. It is evidently *Bryophyllum calycinum*, and what the writer supposed to be legs are tufts of roots where it has struck in the ground; not knowing what to make of it, his fancy has depicted it as a tree with every leaf rooting. Another illustration is that of the Barnacle Goose tree, not unlike Gerarde's well-known figure. It is an interesting fact that illustrations of this are found in ancient Crete, showing transitions from the typical barnacle birds, the intermediary ones having wings coming out of the back, such corresponding to the branches of the barnacle. M. Costantin has figured this in his late work, *Les Végétaux et les Milieux Cosmiques*, p. 280. It shows the extreme antiquity of this curious delusion.

Going back to the fourteenth century, there was then a prevalent idea that worms corroded the teeth. The remedy was to put seed of Henbane and Leeks on a hot tilestone, and conduct the smoke through a pipe into the mouth, when the worms would fall out. Gerarde, writing 250 years afterwards, says:—"Mountibancke tooth drawers runne about the countrey, for to cause woormes to come forth of men's teeth by burning it (seed of henbane), in a chafing dish with coles . . . but some craftie companions to gaine money, convey small lute strings into the water, perswading the patient that they came out of his mouth." The curious fact is that Chinese female itinerant dentists

extract worms at the present day; which, however, they have previously concealed under their long nails. Their fee depends upon the number of worms extracted!

One more remedy, in the fourteenth century. For easy parturition:—"Say 'Quicunque vult' (i.e., the Athanasian Creed) three times, and all the Psalms over her, and"—all will go well! *George Henslow.*

ORCHID NOTES AND GLEANINGS.

METHOD OF CULTIVATING ORCHIDS.

THE *Chronique Orchidienne* for February, compiled by M. Cogniaux for his *Dictionnaire Iconographique*, contains a paper by M. Otto Ballif upon growing epiphytic Orchids in leaf-mould, as practised so successfully by M. de Langhe-Vervaeke of Brussels. Plants so cultivated flourish so exuberantly that a few details as to their treatment will, it is thought, prove acceptable, as, hitherto, certain Brazilian species of *Oncidium*, for instance, have gradually degenerated when grown in ordinary soil for three or four years.

Those who desire to try the experiment should select newly-imported Orchids, which can be immediately repotted in this leaf-mould. A single and large "crock" is sufficient in the bottom of the pot; the plant is set on a little mound, but the earth must not be too much heaped up—on the surface all that is necessary is a light layer of chopped live sphagnum. This sphagnum, which must be kept alive on the surface of the pots, serves to indicate the moist or dry state of the compost, and to prevent the entrance to the soil of other mosses or fungi which spoil the appearance of plants and prevents the air from easily penetrating to the roots in the middle of the pots. The earth used in repotting these Orchids should not be sifted, it should be quite *consommé à point*, that is to say, it should contain no newly-fallen or insufficiently rotted leaves.

The following is the composition of the soil in which M. De Langhe-Vervaeke repots Orchids submitted to this mode of treatment. It consists of about 30 per cent. of Oak-leaves, 15 per cent. of Hornbeam-leaves, 15 per cent. of Alder-leaves, 15 per cent. of Ash-leaves, 15 per cent. of Beech-leaves, and 10 per cent. of coarse white sand.

There can be no question of any exact formula for this or that genus of Orchids, for the good reason that it is not purposed to deal with one special genus, but with a collection of various sorts, the needs of which may not be precisely the same as regards nutrition.

The principal care devoted to Orchids submitted to this mode of culture is to keep them in a position favourable to their growth, and to be very careful about watering. By the use of slight immersion sparingly employed over the plants, the growth of the sphagnum with which all the Orchids are covered is well maintained, thus the sandy leaf-mould which serves as compost is kept slightly damp only, for excessive moisture is in this case to be avoided, as it would have a deleterious influence on the health of the roots.

A NEW BRITISH ORCHIS.

About the end of June, a friend on a visit in the Highlands, sent me for identification an Orchis he found near Arisaig in Inverness-shire, which he recognised as resembling *Habenaria conopsea*, but differing from it, especially in the spur of the flower, which was much shorter; he also noticed that it was even more fragrant. As I did not know it, I forwarded it to my son, who is well up in the native flora. It was new to him, too, and he asked if more specimens could be obtained. With some difficulty, as the flowering was then over, two more were found. After comparison in the Kew herbarium, the Orchis is believed to be *Habenaria odoratissima* (Richard), a species native on mountains in France and Germany, but not before known as British. The spot where it was found is within half-a-mile of the sea, and probably not more than 100 feet above it. *C. Wolley Dod, Edge Hall, Malpas.*

THE ROSARY.

BRITISH ROSES OF RECENT ORIGIN.

Of the many fine Roses which have recently been raised by eminent British rosarians, one of the most interesting has come from Aberdeen. The Messrs. Cocker, who have already distinguished themselves as the raisers of Duchess of York and Duke and Duchess of Fife, have given us a new Rose of the greatest attractiveness, bearing the name of Mrs. James Cocker, which I have at present in full bloom in my garden, and which I think is likely to prove a very great acquisition. Its colour is a beautiful shade of pink, and the flower is exceedingly massive, and very full. It is, in my opinion, a more attractive variety, whether as regards form or complexion, than either Mabel Morrison or Mrs. John Laing, from which Roses its attributes have been derived. While making some other crosses it occurred to the Messrs. Cocker that to cross Mrs. John Laing with a white Rose might have the effect of retaining all the good qualities of that remarkable variety, and at the same time alter the colour, which is somewhat too lilacy to be very fascinating; in short, they had hoped to produce a white or very light Mrs. John Laing, consequently they crossed it on Mabel Morrison, the latter being the seed parent. The cross was successful; but there was only one single seed in the pod, and the new variety is the produce thereof. It is, in short, a Mrs. John Laing, with a colour akin to, but finer than that of Baroness Rothschild, the parent of Mabel Morrison. It is extremely probable that Mrs. James Cocker may yet produce, in virtue of its origin, a pure white variety—by sporting. It must have, for reasons already indicated, an inevitable tendency in this special direction, quite as strong, I should say, as that of its grandparent, the beautiful Baroness, from which we have at least three white derivatives, viz., White Baroness, Mabel Morrison, and Merveille de Lyons. The raisers of Mrs. James Cocker fully expect to have the pleasure of seeing it produce pure white flowers before it is very old; but whether or not those hopes are realised, they may, in the meantime, feel assured that they have produced a valuable variety, which, besides being an ornament to the garden, is likely to prove, by reason of its colour and absolutely perfect form, of service for exhibition.

Another fine Rose, belonging to a different class, is Mr. William Paul's Empress Alexandra of Russia, which also adorns my garden for the first time this summer, growing side by side, for the sake of contrast, with Enchantress, also an emanation from Waltham Cross. They are both vigorous growers, highly distinctive in their colouring, and very floriferous. Waltham Standard, which appears to resemble A. K. Williams in habit of growth, I hope to have in flower in a few days. W. Paul's Aurora, not yet introduced, I have had the privilege of seeing at Waltham Cross, but not his Alexandra, which recently had the honour of receiving that name from His Royal Highness the Prince of Wales. That it will prove itself worthy of such a distinguished title I cannot doubt.

The Messrs. Cooling of Bath have of late years introduced some notable new varieties, of which Lawrence is probably the best; while several valuable Roses for garden decoration have come from Messrs. Paul & Sons, of Cheshunt, to whom, in various departments, we owe so much. The Messrs. Dickson, of the Royal Nurseries, Newtownards, have raised of late some remarkable Roses, among which may be mentioned Ulster, which gained last year at the Crystal Palace the Gold Medal of the National Rose Society; Countess of Caledon, a hybrid Tea of great fascination, the colour of which is carmine-rose; Tom Wood, Robert Duncan, and Ethel Richardson, the last-mentioned being flesh-white in complexion, with large flowers of finely-imblicated form; Muriel Grahame, supposed to be a sport from that highly prolific variety, Catherine Mermet, though raised elsewhere, was introduced by the great Newtownards firm—to whom, however, we are primarily indebted for many new Roses, to which, at least for garden cultivation,

I attach much more importance. The value of a Rose is not, after all, to be absolutely determined by its exhibition capabilities; for, as a general rule, floral productiveness and facility in flowering are by no means among the distinguishing characteristics of those which are remarkable for the dimensions of individual flowers. *David R. Williamson.*

ROSE KAISERIN AUGUSTA VICTORIA.

For freedom of flowering this perfect form of a beautiful hybrid Tea Rose has much to recommend it, and, moreover, it is a very useful market variety. It will soon rank as one of the best, as it is a flower that lasts a long time when cut from the plant, and bears carriage well. As illustrating its lasting qualities I need only mention that some fine blooms were shown by Mr. Spooner, of Arthur Bridge, at our local horticultural exhibition, held on the 13th and 14th inst., which were cut on the preceding evening, were in very good condition at the close of the show, that is, after they had been kept for two days in a hot tent. It is distinct from any other hybrid Tea in colour, being of a creamy-white, shaded with lemon-yellow. It is not a new variety, having been sent out in 1891 by Lambert and Reiter, but until this last year or two scarcely any flowers have been noticed in gardens or at exhibitions. *E. S., Woking.* [It has been observed in numerous stands this year. *Ed.*]

FIG. 15. SECTION OF A MAGNIFIED MALE FLOWER OF *WELWITSCHIA MIRABILIS*, AFTER HOOKER. (SEE P. 68.)

APOSPORY IN FERNS.

It has been suggested to me that it is desirable to maintain a current record of the phenomena observed in connection with apospory or the sexual (or it may be asexual) reproduction of Ferns, though the development of prothalli upon the fronds, instead of through the spore in the normal way. I venture to send a few notes bringing this record up to date so far as my and my co-workers' observations are concerned. The first instance, it may be remembered, was noted upon an abnormal form of Lady Fern (*Athyrium filix-femina* var. *clarissimum*, Jones), which after being reported barren for many years, though sori were apparently abundantly produced, was found capable of free reproduction if the fronds were layered, the apparent sori or spore heaps then developing prothalli in profusion, which in their turn produced typical plants in the usual sexual way. In this case the sporangia were found by Professor F. O. Bower to abort at an early stage, the stalk of the sporangium then producing a prothallus in lieu of spores. This form was subsequently named by the writer soral apospory, to distinguish it from a very different type, which Mr. G. B. Wollaston discovered upon one of our Soft Shield Ferns (*Polystichum angulare* var. *pulcherrima*, Padley). In this case it was not the sporangium, or anything connected with the spore, which produced the prothallus, but the extreme tips of the subdivisions of the frond itself elongated, and ran out into filamentous processes, which dilated into prothalli. This type the writer named apical apospory, and it will be noted as fundamentally different from soral apospory, appearing,

as it does, entirely apart from the normal reproductive site. One very important point in this differential connection, and which so far has not been particularly emphasised, is that while the plants resulting from the soral prothalli of *A. f. f. clarissimum* are perfect and fairly typical, those raised from the apical prothalli of the *Polystichum* are invariably extremely imperfect, being slender depauperate ragged growths entirely devoid of symmetry or any of the characteristic features of the parent Ferns. Subsequently, in *Polystichum* it was found that several other distinct finds of the same pulcherrimum type by Dr. Wills, Mr. Moly (two), and Mrs. Thompson produced prothalli in the same fashion; but the result in each case was precisely similar—batches of defective youngsters, and not a single typical plant, resulting. Further, although the parents are quite distinct, apart from the unusually long falcate subdivision of the pinnules which characterises the pulcherrima varieties, the offspring of all seem identical in their ragged character and lack of vigour. Hence, it seems clear in these several cases that the alienation from the site of the sorus, or proper reproductive points, handicaps the prothallus in its subsequent development of the Fern proper.

On the other hand, however, we have two other cases in which apical apospory is perfectly successful in yielding truly typical plants. *Lastrea pseudomas* apospora, as I have named it, is a very beautifully crested form of the hard male Fern, raised by Mr. Cropper. In this case, under close culture, all the apices develop prothalli freely, and if only one of these apices be pegged down under glass on sterilised soil, it will spread marchantia fashion to an unlimited extent, and produce a multitude of typical and perfect plants. These, moreover, are produced asexually, i.e., apogamously, and it is a moot question, and one worthy of further research, how far apogamy obtains in all these cases. The other case is that of one of the crispum Hart's-tongues (*Scolopendrium vulgare* var. *Drummondiae*). Here we have the usually smooth edge of the frond of this species, running out into fine fimbriations which, if layered, act precisely as the apical outgrowths of the *Lastrea* aforesaid. A prothallus is formed which is so prolific that it spreads *ad libitum* over the soil, developing typical plants in abundance as it proceeds, but usually by sexual action, both archegonia and antheridia being formed. The *Polystichum* prothalli presents the same prolific features, but develop very thick fleshy growths, from which further prothalli are produced in bunches in a very erratic fashion.

I may here appropriately remark that the material supplied to me in connection with Mr. E. J. Lowe's Linnean paper, entitled, "On discoveries resulting from the division of a prothallus of a variety of *Scolopendrium vulgare*, Sm." (*Journ. Linn. Soc. Bot.*, 1896, vol. xxxii, p. 529), yielded a number of plants which after, in the young stage, bearing archegonia and antheridia on the frond-tips, developed without exception into truly typical *S. v. Drummondiae*, leading me to the presumption, which Mr. Lowe does not share, that a spore of that variety, itself, as we have seen, aposporous on some fronds, normally fertile on others, produced the phenomena he chronicled, and upon which I wrote a supplementary note prior to the determination of the varietal character.

Here, then, in *S. v. Drummondiae* and *L. p. m.* apospora, we have two cases where apical apospory is as effectually reproductive as soral. Now, however, we come to a case where both apical and soral apospory are conjoined, and where the results are mixed. This case is that of a second find of *Athyrium* somewhat similar in character to *A. f. f. clarissimum*, Jones, and hence named *A. f. f. clarissimum*, Bolton. Here we have a Fern of slightly inconstant character, portions reverting to normal, while the bulk of the plant is very finely cut, and with a tendency in the terminals to twist spirally, and run out into filaments. The original find, as seen by the writer, although abundantly aposporous sorially, the backs of the fronds being quite white with the incipient prothalli, was not apically so, though the pinnæ when layered,

FIG. 16.—WELWITSCHIA: MALE AND FEMALE CONES. (SEE P. 68.)

- A. Female inflorescence, showing purplish cones of the real size.
 B. Male inflorescence, with anthers projecting beyond the bracts.
 C. Transverse section of female cone.
 D. Longitudinal section of female cone.
 E. Bract and perianth of female flower.
 F. Transverse section of bract and perianth, showing the seed.
 G. Oblique view, showing the bract and the female perianth, $\times 2$.

- H. Portion of male cone with bracts and projecting anthers.
 I. Plan of male or hermaphrodite flower with a bract, two outer boat-like segments, and two inner broad concave segments. The six stamens spring from a membranous tube surrounding an imperfect ovule. (See also fig. 15, p. 62.)
 J. One of the stamens showing the 3-lobed anther opening by three cracks, $\times 10$.
 K. Grains of pollen magn. 800 diam.

developed, both in my hands and in those of Dr. Stansfield, apical prothalli here and there. The soral outgrowths, however, developed so strongly and vigorously that in a very short time masses of dark green prothalli lifted the layered portions from the soil, and in due time a good crop of plants resulted. The great majority, however, were precisely of the depauperate skeleton-like character of the plants produced by apical apospory from the Shield Ferns; a few were fairly representative of the parent with its inconstant features more or less in evidence; while one, and one only, has emerged from the mob as a perfect example of the best features, minus a fault. This plant is very finely and slenderly cut, the terminals all twist spirally, like little ringlets, which are subsequently tipped with a prothallus. Late in the season, the fronds being fully developed, all the minor apices expand into semi-transparent prothalli, forming a fringe of exquisite delicacy, and meanwhile as if the Fern were brimming over with fecundity, the backs of the fronds are covered with the soral form of same phenomenon. This is the latest outcome of apospory, and seems in itself to form almost a culmination of this singular form of reproduction in both its types. A sister plant nearly as fine has gone to Kew, another is all but normal, a fourth is a ragged abomination, and a fifth is one-half a fairly typical plant, with foot-long fronds, from the side of which several extra vigorous fronds double the length are as near the common *Athyrium* as can be, a very curious and striking revision, owing to the form it has taken.

A very interesting feature of the young stages of these aposporous plants is their intermediate character between prothallus and Fern proper. The primary fronds emerging from the prothallus are usually stalked prothalli, themselves of irregular lacinate form, so that the presumed hard-and-fast line between prothallus and Fern, or oophore and sporophore is quite broken through, and in these aposporic Ferns is obviously never firmly established; the two forms of existence, with their characteristic cell formation, alternating even in the adult Fern, which, its normal outline achieved as a sporophore, alters its intention, as it were, and breaks out all over into the oophoric state.

In one of the aposporous *Polystichums*, Professor Bower, Dr. Stansfield (I believe), and myself detected soral apospory as well as apical, but all attempts so far have failed to produce plants other than the ragged, depauperate forms aforesaid. Curiously, with one exception, and that a very striking one, viz., Moly's splendidly variegated *puleberrimum*, all the aposporous *Polystichums* are inconstant and apt to revert to the normal; Bolton's *clarissimum* as a wild find does the same, *S. v. Drummondiae* bears two types of fronds, one coarsely undulate and crested, with plain normal edges and normal sori, the other finely fimbriate and apically aposporous. Hence, the majority of the aposporous Ferns are in an unfixed or unstable condition, the minority, consisting of the first find of *clarissimum* (Jones), and the *Lastrea p.-m. apospora*, are perfectly stable, both in themselves and their progeny, and the same may be said of the hitherto unmentioned case of *Lastrea pseudo-mas cristata*, a seedling of which in the writer's collection bore prothalli on its primary fronds, from which several plants of the typical *L. p.-m. cristata* resulted without the slightest modification. It is worthy of note that this variety, known as the King of the male Ferns, is the undoubted parent of *L. p.-m. apospora* aforesaid, and that it is a persistently apogamous Fern, the prothalli being devoid of archegonia, and producing asexual bulbils in their stead. In the case of *A. f.-f. clarissimum*, Bolton, selected culture through apospory has yielded us one of the most beautiful and curious Ferns existing, demonstrating that the spore is not an essential in this branch of horticulture.

Finally, or almost so, I may cite a quite new and interesting development of what is believed to be apospory in one of the progeny of *A. f.-f. acrocladon*. This *Athyrium* is the extreme form of ramose division, the fronds begin to branch at the outset and continue to do so until, instead of the normal flat

fronds and a shuttlecock arrangement thereof, we have a ball of finely comminuted moss-like vegetation. Spores are rarely produced, but the opportunity of their appearance has been seized, and a plant called *unco-glomeratum* has resulted, which far and away excels the parent in ramoseness and ultimate minuteness of division. I recently saw this plant, and it resembles a ball of velvety moss some 9 or 10 inches over. The capacity for division seems endless, and if pieces be cut off and treated as close cultures, the division continues—and here comes the point: in one case shown me by Dr. Stansfield, they had finished up as prothalli pure and simple. Last case of all, before I draw a conclusion: Messrs. Birkenhead exhibited at the Temple Show in May last, a beautiful plumose form of Shield Fern, *P. a. plumosissimum*. In this most of the ultimate divisions having completed their normal growth, form long linguiform extensions with cordate tips. These struck me as indicative of apospory, though the usual previous filiform extension was absent; and being kindly provided with material, I laid it down, and at this moment of writing can report that from the inferior surface of these extensions, horn-like excrescences are protruding, which I anticipate are incipient prothalli, but in any case are something altogether new in character, and will be reported upon later.

To sum up, the general outcome of my own observations and those of others in this connection is, that excessively fine division of the Fern fronds leads to resumption of the prothallus form at the terminal points, and as such fine division is usually correlated with sterility as regards spores, the faculty of reproduction seems to find in this way an abnormal outlet. This refers, of course, to apical apospory alone; soral apospory is due to some check upon the normal development of the sorus, which of itself finds another way of effecting the reproductive object. The two classes are in this way quite distinct, and in the case of *A. f.-f. clarissimum*, Bolton, even the coarse and nearly normal fronds bear aposporous outgrowths, instead of sori proper, while previous fine division must apparently precede the apical type of prothallus formation. *Chas. T. Drucry, F.L.S., V.M.H.*

A MODEL NORTHUMBERLAND GARDEN.

PROBABLY no two persons would apply the same laudatory terms in describing the remarkable garden of Mr. Geo. Cooke, Stanley Vale, Wylam, a retired professional gardener, who makes his chief pleasure in this life the perfection of his original ideas of gardening, though all would agree that beauty, not only in general effect, but in every foot of the limited space, was there to be found. The space surrounding the house is no larger than what is found around some of the better class of suburban villas, yet in it are carried out all the effects to be found in a well-planned garden of many acres, and thus the small garden plot is transformed into a bijou estate, and that, too, without exhibiting anything insignificant—indeed the dwarf in this case might be called a little giant, so perfect are its proportions in every detail. Used as it is, Nature may be said to have lent herself to the landscape-gardener, though placed in the hands of any other than a genius, such as Mr. Cooke undoubtedly is, it would have been dubbed a piece of uneven, rough ground, of no use for garden purposes. But Mr. Cooke had an idea of something novel and beautiful to be made on that shelving ground, with its little brook at the bottom; and hence we have at the entrance the little carriage-drive to the house, and with it the artificial seems to end, and orderly natural effects to reign supreme.

The spaces between the different little plantations and rockeries are of smooth velvety grass, and where walks are necessary they are of the same green turf, and thus the green ground-work seems to combine the many beautiful designs, each distinct in character from the other. What are known as bedding-plants find no place here, neat growing, and in a great measure dwarf Alpines and herbaceous plants are used. On the higher ground the green walks run

through beds, on one side of which is a row of dwarf pyramid fruit trees, the ground behind them being filled with patches of showy annuals, perennials, and herbaceous plants, most of them covered with flowers. In one place appears a patch of fragrant Pinks, in another of Pyrethrums, and several other patches of showy things bordered by a row of Sweet Peas; further on is a tiny kitchen-garden with more dwarf fruits, and at the end a brilliant show of delicately-tinted Shirley Poppies. On the other hand, on high ground are two low sandstone rockeries partially covered with various species of Heather, and having a narrow mountain-track between them, the rougher background being clad with close-growing *Cotoneasters* and similar trailing shrubs. In the little dell, in a steep rough rockery, are a number of hardy Ferns, very naturally planted, and appearing still more true to nature by the Grasses, Harebells, and Foxgloves which appear here and there among them. At the lowest level runs a narrow brook with shallow waterfall, and behind it is a kind of wild garden, in which are *Polygonums*, *Epilobiums*, and other pretty species, beautiful in foliage and flower. Returning by the little brook, we discover another tiny garden, its close greensward having neat clumps of *Rhododendrons*, *Roses*, &c., one bed of *Roses* edged with *Violas* being very brilliant.

Then, on the sloping ground come a series of miniature views of alpine scenery, its sandstone rocks being clad in places by 3 or 4 feet patches of Mountain Thyme, *Saxifraga oppositifolia*, and other alpines which grow carpet fashion on the ground and rocks. Through these carpets in places appear patches of the many kinds of alpine Pinks, *Androsaces*, flowering *Sedums*, and other pretty flowers, and everywhere appear the bright colours of the alpine *Campanulas*, *Saxifrages*, and *Rock Roses*, and in the larger spaces *Lilies*, *Iris*, *Oenotheras*, &c. Between the rocks is a little, irregular, stone-edged pond in which are flowering *Nymphaea alba*, *Aponogeton distachyum*, *Ranunculus aquatilis*, and other water plants, the rock behind being bright with tufts of *Thymus serpyllus coccineus*, and other tufted herbaceous plants; and all around appear pretty plants very cleverly disposed for affording a natural effect. The Conifers and other trees are in keeping with the neat form of the garden, the knife being freely used to keep each in its proper place.

It is impossible to describe this bijou-garden, but, its genial owner who doubtless knows every plant in the place, and cares for all with equal zeal and pleasure is always pleased to show it to anyone who is really interested in gardening, and is not a mere curiosity hunter. The dwelling has a pretty conservatory of bright flowers attached, beyond it is the vinery, in front of it a fine lot of *Chrysanthemums*, and behind it the bush-fruits.

THE SCHIZANTHUS AS A DECORATIVE PLANT.

"R. N.'s" remarks, *Gardeners' Chronicle*, p. 8, help to recall the magnificent displays of these fine plants that the late Bruce Findlay used to make year after year in the Botanic Gardens, Old Trafford, Manchester. His able and energetic management of these fine gardens, as Curator, and his rare capacity for organising great shows, brought the best of everything to Manchester. And yet it is hardly an exaggeration to say that all the horticultural world wondered almost as much at his graceful and brilliant displays of *Schizanthus* as at the larger white elephants of the great Manchester shows. Mr. Bruce Findlay showed his faith and confidence in these simple flowers by filling several of his larger houses with them, abreast with the very best that the United Kingdom could show at these great exhibitions.

The plants were grown in great numbers, and to the highest perfection. If I remember rightly, Mr. Findlay bloomed the major portion of them in 8 or 10-inch pots; but as "R. N." says, they may be very successfully bloomed in 6-inch or 32's. I have bloomed *Schizanthus* in 6 and in 12-inch pots. In the latter, and in rich soil, with careful stopping

and training, the plants may be moulded into free and natural bushes, or pyramids of beauty from 2 to 4 feet high. But they are more useful in smaller sizes, and have a fairy-like grace of form and colour when trained into table-plants or ranged in groups of colour on plant stages, in halls, staircases, corridors, or window gardens. The flowers have great persistency on the plants, unless they are baked off in full sunshine, and keep well when cut in baskets or vases of water, unless the rooms are too hot and close. There is little to be added to "R. N.'s" list of varieties and modes of culture, unless that by sowing at the three different periods throughout the spring and summer, the conservatory and window-garden might seldom be

should be sown in pots or broad seed-pans, half filled with finely broken crocks, and the less coarse portions of the siftings of the loam and leaf-mould used to sow the seeds in, and above these should come the fine mould, well mixed with plenty of sharp sand, leaving space for affording water, and pressing it firmly. Sow thinly on the surface, and merely bury the seed out of sight, press and smooth, and afford water with a fine rose-can. *D. T. F.*

OAKWOOD, WYLAM.

It is usual to associate the gardens of Norman C. Cookson, Esq., with the Orchids in the hybridisation of which he was the leading amateur experimenter ;

make a very fine display at this season, especially the many species of Campanulas, Phlox, Delphinium, Pæonies, Pyrethrums, Alstroemerias, and Antirrhinums.

In another part of the garden showy flowers, such as *Gladiolus Colvillei* alba, Pinks, Carnations, English and Spanish Iris, and other flowers useful for cutting, are grown ; and in the lower ground, which is beautiful with spring flowers early in the year, is a pond in which the white Water-Lily, together with a few plants of the hybrid coloured ones, are growing strongly, and the former in flower. In the centre of the garden two fine trees of Copper Beech give a good illustration of the admirable effect to be obtained by planting it judiciously, its dark foliage being not only very effective, but also serving to heighten the effect of the other trees and shrubs by contrast.

THE ORCHID HOUSES,

so far as flower is concerned, are at their rarest just now, though some few interesting subjects are still in bloom, among them we noted *Sobralia xantholeuca*, *Brassavola Digbyana*, a few *Cattleya Mendeli*, a good specimen of *C. labiata Warneri*, several plants of *Phaius Humbloti*, *Cattleya Warszewiczii*, *Lælia tenebrosa*, and a nice plant of *Cattleya* × *Hardyana*, raised from a similar cross to that imputed to the imported natural hybrid.

The best examples of culture at Oakwood are the *Calanthes* and *Phaio-Calanthes*, in the hybridising of which Mr. Cookson and his gardener, Mr. Wm. Murray, have both taken very great interest, and evolved many fine things, the last new *Calanthe*, in the depth and richness of its dark ruby-red tint, exceeding even the expectation of the raiser.

Among the *Cypripediums* many were in bloom, especially noteworthy being *C. × Youngianum superbum*, and a curious hybrid raised between *C. Stonei* and *C. Rothechildianum*, which, if not remarkably showy, is still very singular. Other good things in flower were a fine *C. Curtisii*, *C. superbiens*, *Thunia Marshalliana*, and in the cool house some few *Odontoglossums* and *Masdevallias*. Among new crosses very likely to prove of great beauty is a small lot of seedlings between *Phaius tuberosus* and *Calanthe × Sibyl* ; and among plants usually deemed difficult to grow is a fine example of *Lælia monophylla*, sending up a dozen spikes, and which has been grown at Oakwood for some years.

CAMPANULA MEDIUM CALYCANTHEMA.

THIS showy, large-flowered Campanula, familiarly known in gardens as the Canterbury Bell, has long been popular as a pot-plant to flower in early spring, and as a border plant, when it generally blooms before midsummer. The Canterbury Bell has been materially improved in appearance and effectiveness by the selection of a strain which produces flowers in which the calyces are petaloid. The accompanying illustration (fig. 17), represents such a type, the flower bearing some resemblance to a cup and saucer. Seeds can now be obtained of the nurserymen, that may be relied upon to produce a considerable proportion of these "double" flowers, as they are sometimes rather inaptly termed.

The specimen figured was grown by Mr. Faulkner, a seedsman, of Stocksbridge, near Sheffield, and our readers will admit it to be a well-cultivated, profusely-flowered specimen.

NOTICES OF BOOKS.

RIVIERA NATURE NOTES. (Manchester: The Labour Press, Limited.)

THIS is entitled a popular account of the more striking plants and animals of the Riviera and of the maritime Alps. It is only to be expected that, on opening a book upon such a subject as this, we should find in it frequent traces of the work of Commendatore Thomas Hanbury. To him the publication is dedicated, and under his supervision it has been published and annotated.

FIG. 17.—CAMPANULA MEDIUM CALYCANTHEMA.

without these graceful flowers. The sub-variety, *S. Grahami retusus*, is perhaps the most beautiful of all, having white flowers with crimson tips. The pure white *S. candidus* is very welcome with the others. *S. Hookeri* is also pretty, though it is much like *S. Grahami*. All the varieties of *S. pinnatus*, including *Priesti*, a very pure white form, may also be grown in the open air, and may be sown in March, April, and May, to ensure a longer succession.

To ensure a yet earlier flower in the open, a first sowing may be sown in warmth in February, to be planted out of established pots in May. The best season to sow the seeds for winter, spring, and early summer blooming in pots are the months of August and September, raising the seedlings in a cold pit. According to the number of plants required, the seeds

but hardy plants and shrubs are also specially cultivated in this pretty Northumberland garden, and in point of floral display have, at this season of the year, a decided advantage over the Orchids. The gardens occupy the crown of a hill, and are beautified by sturdy Oaks and other trees, whose shade is made use of in the cultivation of shade-loving plants. The broad borders beside the carriage-drive, and skirting the smooth, green pleasure-ground, have large masses of various shrubs, Conifers, &c., planted at the back ; and mingled with those grown for their evergreen foliage, are a fine selection of flowering-trees, such as the white and coloured *Cratægus*, *Spiræas*, *Rhododendrons*, *Roses*, &c., many of which have been, or still are, in great beauty. The fronts of the clumps are planted with showy herbaceous perennials, which

The author, "C. C.," explains in his preface that he has "attempted to make the subject popular, and even amusing. Writing for those to whom natural history is a recreation, it does not seem necessary to adopt the serious style of a scientific treatise." This introduction prepares us for the rather discursive style of the book, wherein anecdotes and "side issues" frequently interrupt the subject-matter. Yet there is so much to say about both the flora and the fauna of so favoured a region as the Riviera, that a small volume can at best but briefly mention a few of the more important features.

Beginning with "grassy places"—for the most part quite unlike our British meadows and lawns—the author passes on to the Great Reed (*Arundo Donax*), to Indian Corn, and to Giant Grasses.

The next and brief section is on Gardens and Gardeners, whence we are led to Plants of Palestine, concerning which it is written that "it is remarkable how many plants mentioned in the Bible are common on the Riviera." This is indeed so much the case, that many more of those described here might have been included under this heading.

It is difficult to see on what plan "C. C." has arranged his "Notes," since chapters on poisonous plants, and Gourds and Pumpkins are divided by others dealing with Green Frogs, Mosquitos, and similarly varied subjects. Again, Myrtle and Eucalyptus, Date-palm and Oak, are separately treated of, although there is a special chapter allotted to Trees.

We do not mean that this detracts from the interest or "amusement" of the volume, but, in spite of the index, it certainly adds to the difficulty of reference. There is, besides the lighter reading, some information of which any intending sojourner in the Riviera would do well to avail himself. We allude to such chapters as those on Sunshine and Shade. The interesting chapter on the Ligurians, Peculiar Plants, Rare and Local Plants, the Sunny South, and Flocks and Herds in Provence.

Now and then "C. C." writes more seriously, as when he says: "At the roots of the Fig-tree you will often find growing either a clump of Iris or the huge bulbs of the Giant Squill (*Urginea*). These remain above ground: they are sometimes as large as the head of a young child. I have often wondered whether the Iris grows spontaneously below the Fig. Certainly the Squill is planted there, for several peasants have not only assured me that this is the case, but have given me the reason for it. The Squill, they say, is useful to the Fig. I should not be surprised to learn that this utility, if such there be, is in some way connected with fertilisation, or with the intricate question of Caprification."

As said before, the book is not botanical only, but general in character, for though the major part of it is devoted to matters connected with the Riviera flora, there is also mention of the wild animals, shells, birds, butterflies, and moths, lizards, and the small quadrupeds. The "Notes" end with an account, by Dr. Allen Sturge, of prehistoric man on the Riviera.

Among the illustrations are included, appropriately enough, views in the gardens of La Mortola. There are also other landscapes showing characteristic vegetation, and many smaller figures of plants, animals, &c. On the whole, the book is certainly an acceptable addition to the local histories of a beautiful spot; and, indirectly, is yet another well-deserved tribute to him who has done so much for the district—to Commendatore Th. Hanbury.

INSECTS: FOES AND FRIENDS. By W. Egmont Kirby, M.D., with preface by W. F. Kirby, F.L.S., F.G.S. (London: S. W. Partridge & Co.)

THIS is a useful little treatise, described in the preface as an English adaptation of a little book which has had a large sale in Germany; but the book and its author are not otherwise mentioned—a serious omission even in a book which is professedly only a compilation. There is no table of contents, but we discover that the insects are arranged primarily into those which are injurious to cultivated plants and trees, as, A, accordingly as they attack the roots mainly; B, the stems of plants; or, C, the

leaves. Useful insects are wedged in between those that are known marauders; and then we come to, D, insects living upon flowers; E, insects living on fruits; then more useful insects immediately in front of the destructive *Bruchus pisi*.

In a secondary subdivision, insects injurious to fruit trees are alluded to, according as they attack the roots, trunk, foliage, &c., useful insects again being sandwiched in unexpectedly. The insects injurious to Gooseberry and Currant-bushes and to Vines, have a section to themselves. Thirty coloured plates, an English and a Latin index, will render this book very serviceable, especially when its low price is considered.

BELGIUM.

THE Ghent Avenir Horticole, under the presidency of M. Armand de Meulenaere, organised fêtes in celebration of the twenty-fifth anniversary of its foundation. In addition to a banquet, on July 10, during the Ghent Kermesse, a competition was held for decorated façades, balconies, and windows, which proved highly successful. On the same day there were also a floral parade, cycling competitions, and a battle of flowers. Some of the carriages, decorated with Orchids, Roses, white Lilies, Anthurium Scherzerianum, or Cornflowers, were much admired. The fêtes were attended by M. Braun, Burgomaster of Ghent, and among the jury was Mr. R. Silberrad, of London. *Ch. de B.*

COLONIAL NOTES.

NATAL.

MR. J. MEDLEY WOOD and Mr. Maurice Evans have commenced the issue of a series of quarto plates illustrative of the plants of Natal. The book is entitled, *Natal Plants: Descriptions and Figures of Natal Indigenous Plants, with Notes on their Distribution, Economic Value, Nature, Names, &c.* The Natal herbarium at Berea now contains about 7500 authentically-named specimens, so that with the aid of this book the difficulties in the way of students will be very materially lessened. The completion of the *Flora Capensis*, which we may hope is now fairly in view, will enable a separate Flora of Natal to be readily accomplished, though we are justified in expecting the discovery of many novelties in course of time. The drawings are naturally and faithfully executed by a born inhabitant of Natal, and by a lady who has passed the greater part of her life in the colony.

The only thing we can suggest is, that in some cases the analytical details are too small. So many bulbous and other showy garden-plants are natives of Natal, that we shall watch with much interest the continuation of this serviceable publication.

VICTORIA.

We are having our rainy or winter season now, of which we stand in great need. We have had very hot weather during the past summer, and no rain, or scarcely any, for six months, so you may imagine how glad we are of a good downpour. I have not yet seen any snow or ice since I have been in the colony. I sometimes think I should like to; it would be more like home weather. Take it altogether, the climate is very healthy here. As regards my business, I am glad to say it has an upward and improving look. And should we get Federation of the Australian Colonies, I believe it would be a boon to every kind of industry. At present we cannot even send plants to either of the other colonies, see annexed newspaper cutting:—

"LAUNCESTON, Monday.

The first prosecution under the newly framed fruit import regulations was heard at the local police court to-day, a well-known lady citizen being prosecuted for importing from Melbourne a plant which she had taken ashore from the steamer *Pateena*. The case was adjourned for a week, that the opinion of the Crown law officers might be taken in interpretation of the word 'plant.'"

B. T. James.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Carnations.—The layering of these plants should be forthwith commenced, so as to get the layers early rooted and fit for planting, and established where they are intended to flower, or put into their winter quarters early in the autumn. In layering, first strip off the leaves from the base of all the stems that are to be operated upon, then, having scooped out a hollow round the plants, fill it with a mixture of leaf-mould and sand, in which to root the layers. Having done this, with a sharp knife make an upward cut from one joint to the other, and half-way through the stem, just below a joint, in a part that is of moderate firmness, bending it till the tongued part is in contact with the soil, fixing it there with a wooden or a wire peg, with the tongue separated somewhat from the stem; and having done this, cover slightly with some of the prepared soil, and so proceed with all the layers from a plant, finishing off the soil level and flat. Keep the soil moderately moist till rooting takes place. In a month or five weeks the layers should be sufficiently rooted to be severed from the parent-plant. When from excessive moisture, damp situation, or smoke and fog, Carnations have to be wintered under glass, then the layers when rooted must be placed in small flower-pots and stood out on a bed of coal-ashes till the time comes to remove them to the cold frames. Where very large quantities of plants are grown, doing this involves a great deal of labour, and it is therefore not possible in undermanned gardens, and the beds and plants have to take their chance. Carnations should be well manured and deeply dug, and if the staple is heavy and retentive, leaf-mould and road-grit, or sharp pit or sea-sand, and charred soil should be freely mixed with it. The situation for the beds should face the south, and it is always advisable to afford the plants a change of ground each year, in order to prevent the degeneration of the former; and continual propagation from the same stock of plants is another cause of degeneration. Plants from fresh sources should also be introduced occasionally to avert this. The borders and beds from which layers are taken should be afforded one or two abundant applications of water. In my next calendar I will mention the names of a number of varieties of recent introduction, which are acquisitions.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorset.

Vandas.—Plants of *Vanda teres* that have just bloomed, and that have stems of an inconvenient height, may be cut off at about 2 feet from the top, and the tops inserted into pots which have been half filled with sphagnum-moss. Do not crowd them together too thickly, or they will not obtain the necessary amount of light. Place the plants in a sunny corner of the Mexican-house, or in the ordinary plant-stove, and well syringe them overhead several times each day. The scandent habit of the plant renders some amount of training needful, and this should be done as often as needed. The aerial roots will soon take hold of the sticks if the plants are vigorous. *V. teres* will grow equally satisfactorily and bloom well when trained to upright Teak-rafts, the raft being inserted into a pot, and firmly fixed with crocks, covering the drainage with sphagnum-moss. Old stems from which the tops have been cut off, if given the requisite heat and moisture, will soon emit fresh shoots, and when these are about a foot long they may be severed, and the stock increased thereby. The new *Vanda* × *Mis* Joaquim is a hybrid of exquisite beauty, and requires the same kind of treatment as *V. teres*. *V. Hookeriana* is now showing flower-spikes, and should be placed in the hottest house in a sunny position; spray the plants frequently until the flowers expand. *V. Kimballiana* and *V. Amesiana* grow best at the coolest end of the Cattleya-house, in a position where fresh air can circulate freely around them; these species should not be syringed overhead, or the leaves may become spotted. *Vandas* of the *suavis* and *tricolor* group need a well-regulated intermediate temperature (especially through the heat of summer), a constantly moist atmosphere, and sufficient water to keep the moss on the surface fresh and green. These plants are apt to lose a number of their lower leaves at this season, but it is usually the result of overflowering, or of a very dry, close atmosphere; they delight in an abundance of fresh air at all times.

Grammatophyllums.—Plants of *G. Measuresianum* and *G. multiflorum* that have started to grow may be repotted, and *G. Ellisii* may also be afforded fresh compost immediately the flowers fade. Shallow pans, with perforated holes around their sides, are preferable to pots for these plants, and they should be small in comparison to the sizes of the plants. The best compost is fibry peat, from which all the fine soil has been sifted, but a few pieces of crock should be added. Press the peat firmly around the base of the plant, and prick in over the surface a few heads of living sphagnum-moss. Suspend the plants afterwards in a warm, shady part of the Cattleya-house, and give water with special care until each plant has become established. The safest method is to sprinkle around the edges of the pan with a fine rose-pot till new roots are seen through the holes. When roots have become numerous, remove the plants to a light position on the north side of the hottest division, and gradually increase the amount of water given.

Galeandra devoniana and *Ansellia africana* are difficult of cultivation in many collections. Both species are commencing to root, and may be repotted if necessary. Place them with the *Grammatophyllums* in the East Indian-house, and afford them the same kind of treatment.

Temperatures.—In the East Indian-house, such Orchids as *Dendrobiums*, *Aërides*, *Phalenopsis*, *Calanthes*, &c., are now in full growth, and an even temperature must be maintained at this period. Fire-heat must not be dispensed with altogether, for stagnant and impure air may by its use be expelled. The pipes should be made sufficiently warm to maintain a temperature of about 75° when finishing up for the night, and regulate the damper so that the temperature will fall about 5° or 6° by morning. If a very small amount of air be afforded the last thing at night at the apex of the root, it will further assist the circulation of air. Coolness at night, combined with excessive moisture, which accumulates around the plants during the early hours of the evening, is generally the principal cause of "spot," so often seen on the foliage of heat-loving Orchids. In the Cattleya and intermediate-houses the pipes should be kept just lukewarm through the night. No fire-heat is needed for the *Odontoglossum* or *Masdevallia*-houses.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

The Strawberry.—The layering of runners, if they are required for fruiting next year, should be finished as soon as possible, layering a good many more than the actual number required, so as to have strong plants to select from for potting; the remainder will be suitable for forming beds. To encourage rooting, water must be afforded daily in dry weather; and should the bed be dry, a liberal application of water will be very necessary. Examine the under side of the leaves of the stock-plants for traces of mildew, and should any be found, mix flowers-of-sulphur into a paste, and add it to the water used, in the proportion of $\frac{1}{2}$ -pint to 2 gallons of the latter, stirring it well before applying it with a syringe, and directing the stream on to the under-side of the leaves of both old and young plants. This is the easiest and cheapest method of ridding the plants of this fungus, and if it be performed a few days before the young plants are severed from the old ones, they will be clean when potted. The runners should be severed from the old plants when their roots have permeated the soil in the pots, which the first layers have already done. After severance, place the runners in the shade for a space of two days, then in their pots in which they are to fruit, a 32, or one that is 6 inches in diameter by inside measurement, which is big enough for early and late forcing. Be sure that the pots are quite clean inside and out before being used, and if they are new soak them in water for several minutes. In potting it is sufficient if one stout concave piece be placed over the hole, and three or four pieces about 1½ inch square, with one edge resting on this, and a few small pieces on these; and to keep the soil from choking the drainage place a thin layer of moss or fibry matter out of the loam used, over which sprinkle a pinch of fresh soot. The best kind of soil is a medium light pasture loam. If loam of this kind be not obtainable, and a heavier kind has to be used, it should be made lighter by the addition of one-eighth to one-tenth of charred soil. The loam used should be chopped with a spade, in pieces about the size of pigeon's eggs, and to each wheelbarrow-load a 4½-inch flower-potful of fresh soot should be added, and thoroughly mixed with it. The soil should be in a moderately moist condition when used, and if it be

dry, moisten it slightly whilst mixing it. Let the potting be performed with the aid of a potting-stick, making it first firm before putting in the runner. Spread out the roots slightly, and bury the new plant a little below the soil, leaving plenty of space for holding water. The potted plants may be stood on an area covered with coal-ashes, standing them close together, and affording more and more space as the leaves extend beyond the rims of the pots. The spot should be well exposed. Afford a liberal application of water with a rose-watering-can, and afterwards afford water to those that require any, and on fine afternoons use the syringe with clean water among them, directing it on to the under-side of the leaves. Never allow runners to grow. Good varieties for forcing are Royal Sovereign, Vicomtesse H. de Thury, Sir C. Napier, and President; and for late use British Queen. This year, late in the season, I gave a limited trial to the new Countess, a variety I was much pleased with.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Celery.—Much attention should be given to these plants, so as to maintain growth in them without a check, by keeping the soil always moist, and stirring its surface at frequent intervals. The latest crops should be planted without delay, affording the soil in the trenches if dry a copious application of water previous to putting out the plants.

Early Potatoes.—When the tops get yellow, lift the crop, and do not wait till the shaws die down. Having dug up the tubers spread them out in a shed on some garden-mats till the skin gets hardened, then store them, keeping a sufficient number for sets apart from the rest. Should new Potatoes be in demand during the autumn, plant any of the quicker growing varieties on a warm border.

Endive.—The plants raised from seeds which were sown in June, will now be large enough to transplant on a moderately rich, not over-warm spot, affording water, and shading them from strong sunshine till growth begins anew. Seeds of the green curled, white curled, and small or large Batavian Endives, may be made thinly in lines or broadcast in beds, protecting the same from the birds; and if the weather be hot and dry, covering the seed-beds with mats till germination has taken place, but not a day longer.

French Beans.—A small sowing of quick-podding, dwarf-growing early varieties may be made on a south border, and in such a manner that protection may, if necessary, be afforded them in the months of September and October.

Runner Beans.—The rows or circles of these Beans will, in light soils, stand in need of water at the root; and in the case of light land, a manurial mulch alongside the rows will tend to keep the plants in growth and flower, and prevent Thrips destroying the bine.

Herbs.—Let all sorts of herbs be gathered as they become ready, drying and storing them as previously directed.

Salad Plants.—Seeds of Radishes and Mustard-and-Cress may be sown frequently this month, also white and brown Cos Lettuces. The dry hot weather will have caused the rapid bolting of Lettuces, and these bolted plants should be cleared off the ground forthwith to prevent the exhaustion of its fertility.

Winter Onions.—Let a portion of a warm border be prepared for this crop in the same manner as that advised for spring sowings; and when it has been got into proper order, sow seeds of the Strasbourg or Globe Tripoli Onions, sowing rather thickly, so that a sufficient number of plants will be raised for drawing for use and for transplanting to other beds. An Onion-bed should always be made on a deeply-dug, heavily-manured piece of ground, and the surface should be reduced to a fine state of tilth, and made firm and level before sowing the seeds.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

The Apricot.—The summer pruning of Apricot-trees being now completed (that is, the shoots not required being cut back to the lower triplet of full-sized leaves, and leaders stopped or not as may seem called for), the temporary laying-in of the shoots may be performed. By reason of the habit of making short spurs, the Apricot is inclined to carry its bearing-wood at some distance from the face of the wall, and at right angles to it, which is a drawback to successful cultivation in the colder parts of the country. If long spurs have resulted from the

practice of letting them entirely or partially unshortened, wherever there are any conveniently placed they may be laid in against the face of the wall at this season, and such spurs as are without fruits removed, so as to allow the new wood a chance of ripening. Search should be made for a small shell-snail, which does damage to the fruits; and traps set for the equally destructive woodlice and earwigs. A copious application of water to the border will add to the size of the fruits, and prevent untimely ripening.

Pears.—All Pear-trees too abundantly cropped should now have the numbers reduced in accordance with the size, vigour, and age of the trees, and the size to which the fruit attains. Whilst dry weather lasts, the border should be afforded water and weak manure-water at intervals of ten days; and to weak-growing trees, applications of Thomson's Vine-manure will do good. The growth of the Pear is late this year, and for this reason the young shoots should remain at full length for the present, excessive cutting away of young growths during the summer weakening the trees by its action on the roots.

Peaches and Nectarines.—Let the trees be heavily syringed with clear water in the evening when the day has been bright and warm. If red-spider prevails to a great extent on any tree, make use of Gishurst compound-soap dissolved in rain-water at the rate of 4 oz. to 1 gallon, rinsing it off with clear water half-an-hour afterwards. Keep all young shoots nailed, laid, or tied in, and all laterals pinched hard back, in order that the fruit may get its full colour. All nails that are within an inch of a fruit must be removed forthwith. The Peach-trees after stoning require a plentiful supply of water if the weather be warm and dry; and liquid farmyard manure may be afforded old trees that may seem to need a fillip, or instead, two applications of Thomson's Vine-manure at the rate $\frac{1}{2}$ lb. to the square yard may be afforded, allowing an interval of three weeks between the applications.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Woolverstone Park, Ipswich.

Lachenalias.—A batch of bulbs may now be placed in 5 or 6-inch pots, selecting those which have been longest at rest. The potting-compost should consist of two-thirds fibrous-loam, and one-third leaf-mould and decayed manure, with some small quantity of sand. The drainage should be ample, as when growing freely the plant needs much water. The tubers when potted may be placed in a cold frame, watered abundantly, and covered with half-decayed leaves or similar materials, removing these when growth has begun.

Scented-leaved Pelargoniums.—A timely shift into a larger pot should be afforded these plants, before they become pot-bound, encouraging them to make healthy growth. They are useful decorative-plants, or as yielding shoots and foliage for cutting in the autumn. To induce a bushy habit, pinch out the points of the stronger shoots, and tie out a little if much compressed. Specimen-plants in full growth may be assisted by frequent applications of weak manure-water, varying it occasionally with clear soot-water. Insects must be exterminated, or the plants will soon be rendered unsightly. Plants intended for autumn use should be plunged outdoors, and well supplied with water at the root.

Acalyphas.—As table-plants these are very effective, either by daylight or artificial light, and this is a good season in which to put in cuttings, and grow them on when rooted in a brisk warmth and a humid air. They soon make plants fit for use in autumn decorations. The cuttings must be shaded from sunshine, or they will lose their leaves, and it is essential that these should be retained down to the bottom of the stem. A close propagating-case, hand-light, or big bell-glass, must be employed to cover the cuttings.

Marguerite-Chrysanthemums.—Any of the cuttings struck in the spring which have not received the final repotting should receive attention forthwith, or becoming pot bound, they will get stunted, hide-bound, and lose their lower leaves. Let the points of the shoots be nipped off wherever this is necessary to produce a bushy growth, and the plants be plunged in coal-ashes outside. Old plants that have flowered and been standing out-of-doors for some time may be cut in hard, and kept somewhat drier at the root till they break. If cuttings are procurable, they may be stuck round the edge of 5 or 6-inch pots in sandy soil, placing these in a close cold frame. When the cuttings are furnished with roots, let air be admitted gradually till they are hardened off. They may be shifted into pots, and the points of the shoots pinched off a few days afterwards.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 23	Royal Botanic Society, General Meeting.
TUESDAY, JULY 26	Royal Horticultural Society's Committee. Tibbself Rose and Horticultural Society.
WEDNESDAY, JULY 27	National Carnation and Picotee Society's Show, at the Crystal Palace. Beckenham Horticultural Society's Show. Brightstone (Isle of Wight) Horticultural Show.
THURSDAY, JULY 28	Bedale Rose and Horticultural Show.
FRIDAY, JULY 29	Redhill and Reigate Carnation and Picotee Society's Show.

SALE.

FRIDAY, JULY 29	Imported and Established Orchids, at Protheroe & Morris' Rooms.
-----------------	---

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63° 3°.

ACTUAL TEMPERATURES:—

LONDON.—July 20 (6 P.M.): Max., 66°; Min., 55°.

PROVINCES.—July 20 (6 P.M.): Max., 71°, Valencia; Min., 51°, Sumburgh Head.

Fine, warm.

The Welwitschia. THE discovery of the Welwitschia, or, as it was first called, the Tumboa, about the year 1860, caused the greatest excitement in the botanical world. One of the earliest, if not the very earliest, public mention of this strange plant was in our own columns (1861, p. 74), in the form of a notice of a meeting of the Linnean Society. Many years after we were privileged to figure the young seedling plants, which showed that the previously-held notion that the huge strap-shaped leaves which the plant possesses were not, as had been thought till then, the persistent seed-leaves (January 7, 1882, p. 15, figs. 2, 3). The classic monograph of Sir JOSEPH HOOKER (then Dr. HOOKER), was published in the *Transactions of the Linnean Society* in 1863, and excited the greatest interest. It was richly illustrated, and most of the figures which have been published since have been copied, with or without acknowledgment, from this famous monograph. In 1866, pp. 734, 778, and 851, various comments were published in our columns by the late ANDREW MURRAY.

Welwitschia is not a plant which would stir the interests of the Floral Committee; but for all that, no plant of any kind has elicited so much interest as this ugly denizen of the arid deserts of South-west Africa. Specimens may

be seen in many museums, where its huge, saddle-like stems and its pair of gigantic thong-like leaves attract attention, if not admiration. A living plant exists at Kew, but its rate of growth is slow. From the edge of the saddle-like stem emerges the inflorescence. One which bears cones like those of a Fir in appearance is female, and bears flowers with a perianth, whose features are portrayed in the illustration (fig. 16, p. 63). The female perianth, when mature, or approaching ripeness, is flattish, roundish, membranous, with minute veins radiating from the centre, and enclosing the seed, whose dispersal is favoured by the membranous wing. These cones are borne in a branching panicle, and being of a crimson or purplish colour, are by no means unattractive.

The male, or hermaphrodite catkins, are borne in similar panicked cymes. The catkin consists of bracts of a golden-brown colour, subtending a membranous perianth of four pieces, the two outer boat-shaped and acute; the inner obovate, broad, and placed cross-wise (fig. 15, and 16 J). The six, or rarely five or even four stamens, emerge at first as a membranous-tube or cup, dividing ultimately into filaments, each bearing a three-celled roundish anther, dividing by three cracks, to liberate the elliptic pollen-grains. In the centre of the flower is an erect abortive ovule, with a curious trumpet-like prolongation of the outer coat, simulating the stigma of other plants.

We have not thought it needful to describe the flowers minutely, as that has already been so thoroughly done in Sir JOSEPH HOOKER'S memoir already alluded to. We have, however, availed ourselves of the opportunity afforded us by Mr. K. DINTER, of figuring the male and female inflorescence, because the *Linnean Transactions* are not always available; and moreover, our figure, especially of the male inflorescence, is more complete. We may also refer to the very interesting account of the habitat, and of the mode of growth of the Welwitschia by our correspondent Mr. K. DINTER in German South-west Africa, as given at p. 27 of the present volume.

The illustrations have been executed for us by our long tried friend Mr. WORTHINGTON SMITH. Comparatively little has been added to Sir JOSEPH HOOKER'S account of the structure. Dr. McNAB examined the development of the flower, Prof. STRASBURGER that of the embryo, Prof. BOWER has studied the course of germination, and the late Prof. DE BARY investigated the anatomy of the stem.

Weather influences on Farm and Garden Crops.

MR. EDWARD MAWLEY, in a paper on "Weather Influences on Farm and Garden Crops," shows how intimately meteorology, horticulture, and agriculture are connected. He alludes to the vast differences, as determined at Rothamsted, in the amount and quality of the crop according to season, and then discusses the climate of the British Isles in general. The requirements of particular crops are dealt with, and in spite of all defects, it is concluded that in no other country in the world can be cultivated so many plants coming from widely different localities with equally different climates. Rev. WOLLEY DOD endorses this view, and it is no doubt the correct one. Taking the mean dates for the Midlands as representing the country as a whole, Mr. MAWLEY finds, as a rule, that East England is, as regards the opening of flowers, three days early; south, five days; south-west,

six days; north-west, two days late; Ireland, north, five days late; north-east England, nine days late.

In conclusion, Mr. E. MAWLEY lays stress upon the importance of the influence upon crops, of changes in the weather. He says:—

"There are a few lessons which all tillers of the soil, whether in garden or on farm, may learn from a consideration of this question of the effect of weather upon vegetation, viz.:—

1. To grow such crops and such varieties of each as can be cultivated with the greatest success in the soil at their disposal, and in the particular climate in which their lot may be cast.

2. To follow the best modes of culture for each crop. For it will be found that crops on ill-cultivated land are, as a rule, far more at the mercy of seasons than those on land which is highly cultivated. Besides which, it has been shown at Rothamsted that a full crop, instead of impoverishing the soil, leaves it, as a rule, in better heart than a poor one.

3. It is also advisable not to place too many eggs in one basket, but rather to grow a variety of crops, knowing, for instance, as we do, that a season favourable for grass and roots is often unfavourable to corn, and vice versa.

4. Another very important lesson taught by the fickleness of our climate is that each farm and garden operation should, as far as practicable, be begun directly a spell of weather favourable for it sets in, for we never know how soon such a propitious period may come to an end, or how long the adverse conditions which may succeed it will continue."

GARDEN ROSE, "DAWN."—In fig. 18, our artist has well portrayed one of the showiest and most beautiful of new garden-Roses. Dawn is a very large single or semi-double flowered Rose, of charming rosy-pink colour. We first noticed it at the Crystal Palace Rose exhibition in 1897, when Messrs. G. PAUL & SONS, Cheshunt, included it in their 1st prize collection of thirty-six varieties of garden-Roses. Since that time the firm has exhibited the variety frequently, and its flowers have been admired again and again. The habit of the plant is described as good, and it is a profuse bloomer. The specimens figured were shown at the last meeting of the Royal Horticultural Society.

ROYAL HORTICULTURAL SOCIETY.—The next fruit and floral committee meeting will be held in the Drill Hall, James Street, Westminster, on Tuesday, July 26, from 1 to 5 P.M. Bamboos will be a special feature at this show, and at 3 o'clock Mr. A. B. FREEMAN-MITFORD, C.B., will lecture on the "Economic uses of Bamboos."

"KEW BULLETIN."—The June number contains articles on Tea Blights, an account of various fungi injurious to Tea in India, drawn up by Mr. MASSEE; who also contributes descriptions of various exotic fungi. "Miscellaneous notes" justify their title. The acquisition of a Totem Pole made from the wood of *Thuya plicata* = *gigantea*, is very interesting.

LINDLEY LIBRARY.—The Catalogue of the Library is, we learn from an official document, now actually ready to be put into the hands of the printer, but the preparation of it has been a far more lengthy and expensive matter than was anticipated, and the Trustees have come to an end of their funds. Subscriptions, to enable them to go to press with the Catalogue at once, are earnestly requested. Address: Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W.

— We are requested to acknowledge the receipt of £1 from BRODIE of Brodie.

TWO SCARCE BOOKS.—In revising the Lindley Library, the two following books have been discovered, concerning which little is known. The *Flora Londinensis*, it need hardly be said, is not the work with the same title issued by CURTIS. There is no indication of the author, and the only hint as to

FIG. 18.—ROSE "DAWN": COLOUR ROSY-PINK. (SEE P. 68.)

date is given by the watermark to the paper, which is 1794, so that the book can hardly have been published before that date. The *Fruiterers' Secrets* is in black letter, and is mentioned in Johnson's *History of Gardening*, and in Miss Amherst's *History of Gardening in England*. It was republished in 1609, under a different title.

THE FRUITERS SECRETS:

Containing directions, for the due time, and manner, of gathering all kinds of fruits, as well Stone-fruits as other: and how they are afterwards to be ordered in packing, carrying and conveying them by land or by water; then in separating or culling them into divers sorts; and lastly, in preserving or laying them up, so, as may be for their best lasting and continuance.

Enterlaced with diverse other secrets (and their natural causes) touching trees, and their fruits.

No treatise, to this purpose, being heretofore published.

At London,

Printed by R. B. and are to be Sold by Roger Jackson, at his Shop in Fleete-Streete, neere the conduit. 1604.

FLORA LONDINENSIS OR THE Flower Garden displayed

Drawn from Nature by a Botanical Painter and accurately engraved by an eminent Artist, with a description of each flower, its culture, &c.

London

Printed for the Proprietor, no 31 East Place Lambeth &c.

—Who was the proprietor?

THE ATTENDANCES AT THE DRILL HALL.—

The good people of Newcastle were last week apprised of the increased importance and popularity of the meetings that the Royal Horticultural Society hold fortnightly at the Drill Hall, James Street, Westminster. Sir TREVOR LAWRENCE, when speaking at the luncheon, on behalf of the deputation from the parent Society in London, said that the Director of the Royal Gardens, Kew, had remarked to him that James Street, in which the Hall is situated, is frequently so thronged with visitors that it is difficult to move without treading on the heels of a Duchess. Those who habitually attend these meetings will appreciate this remark, knowing well that, comparatively, the altered circumstances at these exhibitions may be held to justify such a comment. "So long," said Sir TREVOR, "as the Society fulfils the real duties of a horticultural society, would it succeed." Just so, and the present measure of success has resulted from the practice of such a policy.

MR. T. HUMPHREYS, of the Chiswick Gardens, who was recently so seriously injured by a cricket-ball, is now, we are glad to learn, so far recovered that he has gone north for a change of air.

OROBANCHE SPECIOSA.—From Trinity College Botanic Garden, Dublin, Mr. BURBIDGE obligingly sends us specimens of this plant, grown by sowing seeds along with those of the Broad Bean, on which it is parasitic. The stems are viscid, purple, and bear many-flowered spikes. Each flower is about three-quarters of an inch long, white, flushed, and lined with narrow lilac stripes; the rounded lobes of both upper and lower lip are prettily fringed. The bract is lanceolate, nearly as long as the flower-tube. The plant is a native of Spain, Italy, Dalmatia, Greece, &c.

UNSEASONABLE FLOWERING OF A CHRYS-ANTHEMUM.—Mr. J. F. N. BARTLETT, of Peverel Court, Aylesbury, obligingly sends us a photograph of a Chrysanthemum "niveum" in full bloom. It

was raised from a cutting taken this year. The photograph is a good one, and the blooms are satisfactory; but we do not at all want to anticipate the deluge we may expect in November—for everything in its season.

THE LEGION OF HONOUR.—M. ROMAIN DE SMET and Mr. CHARLES VUYLSTEKE have been nominated Chevaliers of the Legion of Honour.

SCOTTISH ARBORICULTURAL SOCIETY.—The general meeting will be held at 1, Queen Street, Edinburgh, on Tuesday, August 2. The President will deliver an address on Canada, with limelight illustrations. The reports of the judges on the several essays sent in for competition will be announced. The annual excursion will be held from August 3 to 5 inclusive, in the Forest of Dean. It is estimated that the total cost per member will be £4 6s. 4d. Communications should be addressed to the Secretary, Mr. ROBERT GALLOWAY, 5, St. Andrew Square, Edinburgh.

COLD STORAGE PÆONIES.—The *Weekly Florists' Review* gives an illustration of a compartment in a Chicago cold storage warehouse, where the KLEHM BROS. store their Pæonies in cold storage. The blooms are cut when in the bud, but not till the top petals start to separate, making what is called "the split." The buds are then wrapped up in bundles of fourteen each, to make a generous dozen, and placed in buckets about half full of water in the cold storage room, which is maintained at about the freezing point. The water is not changed, and will remain sweet as long as the flowers are kept there. The paper is placed around the buds only, and not around the lower stems, and different coloured paper is used to designate the different varieties they contain, which is preferable to labelling the bundles. The paper is to keep the buds from being touched by frost. Care is taken to never wet the blooms. In this way a number of varieties may be held from six to eight weeks, and come out apparently as fresh as when put in. When taken out for use a little piece is cut off the end of the stems and the buds placed in water, when they open gradually. If the bud is cut a little too tight, when it does open it will pop wide open and drop. And not all varieties will respond to the cold storage treatment. The white sorts seem to be the best keepers, though the fine sort known here as "Drop White," is one of the poor keepers. The early sort known here as "Old Red" will not keep at all in cold storage, while the common pink sort will keep only ten days or two weeks.

PROFESSOR SURINGAR.—We regret to hear from one of our Dutch correspondents of the sudden death, in his laboratory, of Professor SURINGAR, the Director of the famous Garden and Herbarium of the University of Leyden. Professor SURINGAR was born at Leeuwarden, December 28, 1832, and was appointed to Leyden in 1857, in succession to MIQUEL. His work was varied, but much of his attention was devoted to the Algæ. Professor SURINGAR was a frequent visitor at botanical and horticultural congresses, and the last time we saw him was at the last Ghent Quinquennial in April last. He was an occasional contributor to these columns, and we had sometimes to refer to him for information, which was always freely and pleasantly accorded.

THE PLANTS OF LEWIS AND CLARK'S EXPEDITION ACROSS THE [AMERICAN] CONTINENT IN 1803-6.—In July, 1803, Capt. LEWIS started from Washington with a party across the Continent to the Pacific Coast. The task was clearly no mere holiday trip, as the country and its resources were then entirely unknown. LEWIS and his associates were instructed among other things to note the food plants of the Indians, and the dates at which particular plants put forth flowers and leaves. What became of the collection has never definitely been ascertained till this time, but some of the material found its way into Lambert's herbarium, and after the dispersal of that collection some of the plants found their way to the Academy of Natural Sciences of Philadelphia. These plants have been determined

by Prof. ROBINSON, of the Gray herbarium, and Mr. GREENMAN. The results of this examination, so interesting to American botanists, are given by Mr. MEEHAN in the *Proceedings of the Academy of Natural Science, Philadelphia*.

CRICKET MATCH AT SYON HOUSE.—The *Gardeners' Chronicle* staff and friends engaged on the afternoon of Saturday, 16th inst., in a friendly match with the Syon House Cricket Club, the wickets being pitched in the vicinity of the gardens and the high road, an ideal spot for such a purpose. The home team won the toss, and elected to go in first. Their innings, added to by 16 byes, amounted to 70, the highest score being that of Mr. STROUD, with 26. The *Gardeners' Chronicle* men then went to the wickets, and by the end of the game had made a score of 133, of which only 2 were byes, pointing to the better fielding of their opponents. The highest score of this team was made by Mr. GRIFFIN—95, who went in first, and almost succeeded in carrying out his bat. It is intended to play the return match early in September.

SELF-FERTILISATION.—M. C. GERBER contributes to the *Comptes Rendus* for June 13, a paper on self-fertilisation in certain plants whose flowers, at first sight, seem adapted for cross-fertilisation. Taking the genus *Cistus* as an instance, he mentions how, by the conspicuous habit and colour of the flowers, they seem specially adapted for attracting insects, although in reality they are self-fertilised. The process by which this is effected is the peculiar action of the calyx, explained by M. GERBER in the following summary of his experiments:—"1. *Cistus* have a calyx which tends, owing to its peculiar structure, to remain pressed against the ovary, compelled, when the flower opens, to separate itself owing to the turgescence of the base of the corolla; it quickly closes, mechanically, like an elastic plate, which resumes its state of equilibrium, as soon as this turgescence diminishes. In so doing it throws off the petals in regular sequence. 2. The calyx is composed of three portions only; the two green external folioles should be considered, according to WILLKOMM, and contrary to the opinion of LINNÆUS, LAMARCK, DE CANDOLLE, SPACH, PAYER, PLANCHON, BAILLON, &c, as bracts corresponding to two little bracts which accompany the three sepals in most *Helianthemums*. They constitute a uniform involucre comparable to the involucre of *Anemone Hepatica*. 3. Owing to the pressure which the calyx exerts, in closing on the stamens, self-fertilisation is assured, even in the case where foreign pollination could be effected during the relatively short time that the flower remains open. Also, it may be said that the chasmogamous flowers of *Cistus* obey merely apparently and by habit the law of dichogamy, and that they become true cleistogamic flowers after the closing of the calyx. 4. Therefore the size, beauty, colour, and attractiveness of flowers do not always furnish proofs of the adaptation of the plants to insect pollination. This conclusion confirms the experiments of M. G. BONNIER and the observation of M. PLATEAU, that neither the form nor the bright colour of flowers appear to play any important part in attracting insects."

PLANT DISEASES.—The browning of the Vine, which was treated with so much humour by Mr. BLACKMORE at one of the meetings at Chiswick, is now ascertained to be caused by a slime fungus. More recent researches show that it is by no means confined to the Vine, but that it is met with in Beet-roots, Potatos, Melons, Cucumbers, Artichokes, Laurel-Cherries, Aucub, Cherries, Apricots, and Plums. The *Pseudocommis*—for such is the name of the slime-fungus or Myxomycete, determines the gumming, the fungus known as *Coryneum* being now excupulated. In addition to the plants mentioned, Apples, Pears, Chestnuts, Poplars, and Sugar-cane are mentioned by Mr. ROZE as subject to this terrible scourge. In many cases the disease has been attributed to other fungi. The existence of the other fungi is not denied, but it is supposed that instead of being directly injurious, they merely feed on the

tissues decayed and injured by the presence of the myxomycete. These are questions which must be settled as soon as possible in the botanical laboratory. The present state of uncertainty is worse than embarrassing to the practitioner. Inoculation of a previously healthy plant with spores of the several fungi was considered as sufficient proof of the malignity of that particular fungus, but the slime-fungus can as easily be introduced, and the evidence is as strong in the one case as in the other.

THE JOURNAL OF THE SCOTTISH METEOROLOGICAL SOCIETY, just issued, contains a very valuable paper on the mean atmospheric pressure and temperature of the British Islands, by Dr. BUCHAN. It is illustrated by charts and diagrams. It is, in reality, a revision of the observations made during forty years, from January, 1856 to December, 1895. The beneficial effect of the relatively warm Atlantic is shown very strikingly by the statement that were it not for the prevalence of W.S.W. winds, the mean temperature of London in the middle of winter would be 22°; of Edinburgh, 12.5°, and of Shetland, 7.5°. Various other records attest the industry of the observers and computers, and prove the great value of a publication, the formidable figures of which have at first a repellent look.

PUBLICATIONS RECEIVED.—*Dictionnaire Pratique d'Horticulture et de Jardinage*, livraison 72, to U. L. M. U.—*Nature Notes*, July.—*Insects: Foes and Friends*, by W. E. Kirby, M.D., with preface by W. F. Kirby (Partridge & Co., Paternoster Row). A dainty-looking book, small enough for the pocket, and with coloured illustrations.—*Journal of the Royal Horticultural Society*, July. This contains, among other articles, papers on "Orchids in Guiana," by Mr. Everard F. im Thurn; "Cooking Vegetables," by Dr. Bonavia; "Horticultural Soils," by Mr. J. J. Willis; "Trees and Shrubs in the Isle of Wight," by Mr. S. Heaton.—*Observations on the Flowers, Fruit, and Seedlings of Saintpaulia ionantha*, Wend., by Dr. John H. Wilson. This paper is written in Flemish and English in parallel pages.—*Residential Sites and Environments, their Conveniences, Gardens, Parks, Planting, &c.*, by Jos. Forsyth Johnson (New York: A. T. Delamare Printing and Publishing Co.). A handsome volume, liberally illustrated, and which will receive further note when space permits.—*Vegetation and Scenery in the Metropolitan Reservations of Boston*. Forestry Report, by Ch. Eliot, presented February 15, 1897 (Lamson, Wolfe & Co., Boston, New York, and London). An interesting and illustrated report, to be mentioned more fully at a later date.—*The Botanical Gazette*, June (Chicago, Ill.), contains articles on the Vegetation Regions of the Prairie Province, by Roscoe Pound and F. E. Clements; Nutation of *Helianthus annuus*, by John H. Schaffner; Mode of Dissemination and on the Reticulations of *Ramalina reticulata*, by J. G. Peirce; Life-History of *Euphorbia corollata*, by Florence May Lyon; Size of Evergreen Needles, by Edwin Bingham Copeland; Reasons why the Rochester Nomenclature cannot be regarded as a Consistent or Stable System, by B. L. Robinson.—*Some Interesting Soil Problems*, by Milton Whitney (Reprint from Yearbook of U.S.A. Department of Agriculture for 1897).—*Partial Report of Work of the Agricultural Experiment Stations of the University of California*, for the years 1895-96, 1896-97 (University Press, Berkeley). This volume includes the notes of the work done at the several experiment stations during the time mentioned, also of that accomplished in the agricultural laboratories. Entomology and Plant Diseases, and Miscellaneous Memoranda occupy two more sections. Report on Culture-work at the Central Experiment Station and Sub-stations takes up another. We also note a paper on the "Olive Knot," by F. T. Bioletti.—*Additions to the Fungi on the Vine in Australia*, by D. McAlpine, assisted by Gerald H. Robinson (Department of Agriculture, Victoria). A valuable report on various (1) parasites, and (2) saprophytes, clearly and delicately illustrated.—*Die Natürlichen Pflanzenfamilien*, 175 und 176 part.—*Congrès Horticole de 1898, Procès-verbal de la Séance* (Paris: 84, Rue de Grenelle).—

Phytophthora infestans De Bary, et de la Pourriture des Pommes de Terre, par M. E. Roze; also *Un Nouveau Type Générique des Schizomycètes*, par M. E. Roze (*Extraits du Bulletin de la Société Mycologique de France*).—*Parasites Végétaux que attaquent les Rosacées utilisées en Horticulture*, par M. E. Roze.—*Journal de la Société Nationale d'Horticulture de France*, June, including papers on "Ornithogalum pyrenaicum comme plante Comestible," by M. P. Hariot; "Inauguration du Monument Hardy," by M. Viger; and various reports and notes.—*Tijdschrift voor Tuinbouw*, elfde en twaalfde Aflevering.

PLANT PORTRAITS.

ACALYPHA SANDERII, N. E. Brown, *Le Jardin*, June 20.—The first coloured plate of a species which was first described and illustrated in our own columns.

ALBERTA MAGNA, *Garden*, May 21, 1898.

APPLE "FLORA."—A large rounded conic Apple, red, streaked on the sunny side, *Bulletin d'Arboriculture, &c.*, June.

BRYOPHYLLUM CALYCINUM, *Revue de l'Horticulture Belge*, June.

VEGETABLES.

THE ROUNCEVAL PEA.

ONE of the oldest types of Pea is probably that known to our forefathers as the Rounceval, of which there were three or four varieties. Mr. N. N. Sherwood, in his paper on "Edible Peas," at the last meeting of the Royal Horticultural Society, alluded to the Rounceval Pea as having been grown in this country in the time of Queen Mary. The earliest seed catalogue in my possession, 1817, includes two varieties of the Rounceval Pea—the white and the green. George Lindley in his *Orchard and Kitchen-garden*, 1831, gives the white Rounceval in his list of twenty-six varieties. A catalogue issued by James Carter, 238, High Holborn, in 1842, one in remarkable contrast to the elaborate document issued in the present day by his successors, gives the white Rounceval, but ten years later it had entirely disappeared from leading catalogues, for by that time such varieties as Sangsters' No. 1, Champion of England, British Queen, and Ne plus Ultra, had come into cultivation. Peter Lawson & Son in their *Agriculturists' Manual* for 1836, describes the grey Rounceval Pea as "at once the tallest growing, the latest, and largest of our field Peas; height, 6 to 8 feet." This statement is confirmed by M. Henry de Vilmorin in the *Vegetable Garden*, who describes it as "the tallest growing and latest kind of field-Peas out, at the same time the most productive next to the Partridge Pea." This also refers to the grey variety.

I applied to M. Henry de Vilmorin for information as to the name of this Pea. He thinks the place of its origin to be England, where it appears to have been grown pretty extensively for a long time, and it was from this country it was introduced to the notice of Messrs. Vilmorin & Co. But M. de Vilmorin thinks the name Rounceval to be of "French origin, although no place or hamlet of any importance in France bears that name at present, the nearest we can find is Roncevaux. At all events Rounceval sounds like the mediæval name of a place or vale abounding

with brambles, and we should therefore be inclined to think that it is the name of a place, and not of an individual." R. D.

SNOWFLAKE CAULIFLOWERS FOR FORCING.

I have this year grown Messrs. Little & Ballantyne's little Snowflake Cauliflower, and can scarcely speak too highly of it as an early forcing variety. I sowed the seeds in the second week in February indoors, pricked out and potted the young plants, and transplanted them to the open. From these plants I was enabled to obtain some fine heads in the last week of the month of May. The Cauliflower plants were afforded rich soil, and a warm border, but no protection whatever. Some of the heads measured from 16 to 18 inches, and one was 20 inches in circumference; a fine variety for early work in the south. A. Smith, *Eden Hall Gardens, Langwathby*.

MARLEY HALL, EXMOUTH.

(Concluded from p. 55.)

PASSING from the range of vineries, we entered a greenhouse, 60 feet long and 16 feet wide, filled with Malmaison Carnations, Cinerarias, zonal and show Pelargoniums, Petunias, and Gladiolus Colvillei alba, mostly grown for decoration. Marguerites are grown in large numbers, as also Richardias; these last are, as regards some of the stock of plants, planted in the kitchen-garden borders. The Pine-stoves form a range that measures 100 feet long, in three divisions. The first is at the present time devoted to Melon-growing, and to rooting Pine-apple suckers; the second is filled with succession Pines, and the third to fruiters, of which at the time of my visit I noticed no less than forty in various stages of development, mostly Queens; although some Smooth Cayennes and Rothschilds were remarked. The weight of the fruits ranges from 5 lb. to 6 lb., and the whole of them are consumed by the family, or given as presents by the generous proprietor. Fine Stephanotis, Dipladenia boliviensis, Passiflora alata, &c., are grown on wires over the path in these Pine-stoves, the Passiflora bringing a number of its luscious fruits to perfection.

Immediately in front of this range, on a narrow border, was noted a row of Chelsea Gem Pea, just coming into bearing, and as soon as these are finished a row of Tomatos will be planted, and grand crops of fruits will doubtless be gathered from them. The Exonian Pea was vigorous and strong; and here, too, I noticed a good dressing of long litter under one bush fruit—a wise and helpful mulching.

The second garden is bisected by a broad walk, and here on either hand are annuals and herbaceous and bedding-plants in abundance. A good portion of one wall is covered with a range of Peach-houses, about 170 feet long, and divided into four unequal divisions, one being also a Rose-house. In this one Maréchal Niel and Catherine Mermet Roses have done wonderfully well, bringing large flowers, and of most perfect form. Citrons on the back wall of this house are almost always carrying fruit of large size, although not of a very useful character.

The Peach-trees in the three divisions are in various stages, a trellis on the front rounded over so as not to monopolise all the light, allows good trees to be grown on the back wall, and these are fastened to wires running the whole length of the divisions. Perfect in shape, vigorous in foliage, with capital crops on almost every tree, afford testimony to good culture. A fine lot of pot Strawberries are grown, mostly Royal Sovereign and President, and as the first dish was sent in of the former on March 1, it will be seen that these are well looked after.

Cucumber and Melon houses, with divisions devoted to Tomatos, Pancratiums, and a few Orchids, among which Peristeria elata in several specimens were noted. A large quantity of plants for house decoration, besides the usual run of plants for bedding-out purposes, will give some idea of the extent and variety of the operations carried out. Gloxinias and Begonias in frames alone formed a feature, and in fact, every available space was noted as being filled

with plants for early or late uses. I cannot conclude my notes without a word of praise for the cleanliness, order, and method shown everywhere, the freshness and neatness of the lawns, paths, and borders; not forgetting a word of thanks for the kindness and attention shown to me by the excellent gardener, Mr. Baird. *W. Swan, Exmouth.*

THE DANE PARK, MARGATE.

WITHIN the last few years several important public events in connection with the town of Margate have demanded public recognition and celebration, but it is safe to say that no more important event in the history of the borough has been recorded than that which was celebrated on Wednesday, June 1, 1898, with all the dignity and official display at the command of the town, the Lord Mayor of London, Col. H. D. Davies, performing the opening ceremony.

of presenting it to the borough to be for ever a public park and recreation-ground. Mr. Woodward having succeeded in his object, and secured about 33 acres at great expense, in February, 1896, addressed a letter to the Town Council, offering to hand over the whole of it to the town for the purposes in view. He expressed the hope that the ground-rents or purchase money of certain parts of the estate would be sufficient to lay out the sixteen acres to be reserved for a park. He stipulated that all the roads of the estate should be 50 feet wide, and that the work should be completed within twelve months of the following Michaelmas, when the tenant would give up possession.

The Town Council during the first year went as far as circumstances would permit in their arrangements for converting the land into a public park, but the bulk of the work of preparation has fallen within the last eighteen months. Messrs. J. Cheal & Sons, the

old trees. The old farmhouse which stood near has been taken down, and the whole surroundings are decidedly pretty. The natural slope of the ground inclines towards the water, and at the back is an embankment forming the roadway beyond. There is a miniature island in the lake, and bold rockwork, in the crevices of which have been planted flowering plants and shrubs, forms an excellent background for the lake. A summer-house and retreat on the raised bank at the end commands a view of the water, and a finish is given to the whole by a rustic bridge, beds of flowering plants, and the pavilion and band-stand in the distance.

Near the main gates a caretaker's lodge has been erected. The greater portion of the southern slope, however, is intended to be retained as grass, with open groups and clumps of trees to afford shade, whilst a few single trees are or will be planted in the western portion of the grounds. A new road has

FIG. 19.—A VIEW IN THE NEW TOWN PARK, MARGATE.

Anything that is calculated to increase the attractions of Margate as a watering place, or enhance the reputation of the town as a health resort, deserves the heartiest support of the inhabitants. The acquisition of such a valuable property as the Dane Park for the use of the public in perpetuity promises to do both these things. Desirably situated, sheltered from the winds, well covered in parts with trees, and not lacking that which is picturesque and attractive in nature, the new Park must certainly prove an attraction.

It may be as well to state in what manner the Dane came into the possession of the town. About three years ago certain farm-lands situate in the Dane Valley, known as Dane Farm, came into the market. It was offered for sale by the owners in several lots, but at the auction sale it was not all disposed of, and it appears to have then occurred to Mr. John Woodward, a native of the town, and who is now residing in retirement at Croydon, to acquire a portion of the property with the object

well-known nurserymen of Crawley, Sussex, were entrusted with the preparation of a design which was submitted to and received the approval of Mr. Woodward.

The western end of the estate, that part which had formed the immediate surroundings of the farm-buildings, best lent itself to picturesque treatment on account of the undulating nature of the ground, and the number of existing trees. But whilst much attention has been paid to effect and the picturesque, at the same time care has been taken to blend the lovely grounds of Dane Park in the general design, and make its natural features as useful as possible. It was, therefore, decided that this corner of the park should be retained as the more select, and that arrangements should be made for cricket and other forms of recreation in the open part of the estate. On entering the grounds, the visitor is immediately attracted to the neighbourhood of the lake (see fig. 19), a small but very picturesque piece of water, shaded on one side by fine

been formed, completely circling the Park, and as only a light open fence is erected between, the road commands good views over the whole of the area. No other carriage-drive is under these circumstances necessary, but a wide walk leads all round the grounds, which will be suitable for bath-chairs, and there are also numerous side-walks giving access to the various objects of interest and best views on the ground.

HOME CORRESPONDENCE.

GARDENING CHARITIES AND SELF-HELP.—Mr. Thos. Fletcher is quite right in saying that the best charity of all is to help people to help themselves, and if this were thoroughly done, there would be less need for the Royal Benevolent Institution. But where is the benefit of preaching this sound truism to those in sore trouble and distress? These could not or did not provide for a rainy day. Are they and their wives and children to be left to starve when age, and want, and fraud, that ill assorted trio,

make many deserving sufferers mourn? How many widows' and orphans' portions and old-age pensions for gardeners did Jabez Balfour squander? The industrious poor are always with us, notwithstanding all our scrapings and savings. By all means save as we may through Friendly Societies or otherwise. Through loss of health, wife, or children, situations, savings or investments, poverty often comes in at the door of the most deserving, and self-help fails when it is most needed. But why should Mr. Fletcher or others pit these one against the other? Five shillings a week for an orphan bairn, £18 for a widow, £20 a year for a man, are by no means too liberal allowances, far less a fortune, though a blessed barrier between sudden or inevitable misfortune and starvation, or a pauper's doom in the workhouse. In no other walk of life that I am aware of have friendly societies removed the needs for the demands for benevolence; and as for the charges of extravagant management, they are wholly without foundation, so far as the garden charities are concerned. All candidates have to run through rather severe ordeals before election as pensioners. They have to run the gauntlet of a contested or competitive election, and satisfy the committee of their need. It has frequently been said and thought by many that the standard of poverty for qualification for a pension has been pitched too low. Through an intimate intercourse with gardeners and their patrons for more than fifty years, I have never heard anyone say that the pecuniary standard for election had been pitched too high; but I differ yet more widely from Mr. Fletcher in his other two propositions, which are to the following effect: the first is his own assertion—that a subscriber to the Gardeners' Benevolent Institution is sure of nothing except a vote; the second flatly contradicts Mr. Monro's perfectly true statement, that each subscriber may be either elected a pensioner or receive benefit. As to Mr. Fletcher's first assertion, it is a mere truism, and equally applicable to all other benevolent institutions, as of any of our garden charities. How can Mr. Fletcher or any other subscriber be sure of more than a vote until he has satisfied the committee of his need of more—that is, of a money-grant—to help him through his age, suffering, or poverty. But is the vote then worth nothing? On the contrary, it is worth infinitely more than a pension to most gardeners. Votes enable all of us to help our brothers and sisters and their orphans in their times of deepest trouble, and thus help us to bear one another's burdens and so lighten our own. I have spent a good deal of time and used many postage stamps over these votes, and reckon them among my most happy and fortunate investments from a rather limited income. In this nobler sense, too, Mr. Monro's statement is literally true. Each subscriber is either elected a pensioner or derives some immediate benefit. Has Mr. Fletcher not read in the Old Book that it is more blessed to give than to receive. There is no need to relinquish reliance on self-help. It is the earnest hope and desire of the majority of the subscribers to the gardeners' charities, that they and others may never need the pay or pensions. What then? This. Even self-help sinks to a lower level of charity than the help of others more needy than ourselves. Assisting others in this spirit we may, should hard fate or necessity lay that burden upon us, accept the help of others without sacrificing our self-respect or manly independence. This much is certain for us all: our contributions will have lightened by many feather's weight the burdens and the sorrows of our brothers and sisters of the craft. I cannot conclude without thanking our liberal patrons in society, the trades, the Press, and all who have so generously contributed to our Societies, hoping for nothing in return. May I heartily assure all such of the deep gratitude of gardeners. As a rule only the few grumblers are heard—the numerous grateful gardeners are silent. Would that this year a thousand more gardeners would join our charities, and help us all the more and better to help one another and ourselves, as well as give a cheerful stimulus to our richer patrons. *An Original Subscriber.*

—I must confess I am rather surprised at Mr. Thos. Fletcher's evasive letter in your last issue, but I cannot consent to let the matter "stand in abeyance" as he suggests. He wrote to me direct last week, and in reply I offered to leave the decision to Dr. Masters, or to anyone he thought fit to appoint, providing they understood the working of the Institution, but as he appears afraid to submit to this I have no alternative but to leave it to your readers, "the subscribing gardeners to the Gardeners' Royal Benevolent Institution," to

say whether Mr. Fletcher or I must pay the £20—the matter cannot be shelved in the way he suggests. The case in a few words is this: Mr. Fletcher asserted that subscribers were sure of nothing but votes. I answered that all applicants who were subscribers, and passed by the Committee as necessitous, and eligible according to the rules, were either elected, or derived benefit from the "Victorian Era Fund," according to the number of years they had subscribed. Mr. Fletcher then said if I could get this officially confirmed he would pay £20 to the Treasurer. I proceeded to do this, and before seeing Mr. Ingram's reply offered to pay the £20 if I had overstated the case. It is for your readers to judge who is to pay the amount, and I leave myself in their hands. *Geo. Monro.*

—Far be it from me to throw even the smallest stone at our present gardening societies. Each is good, even if some persons may detect weak points in them. The older Royal Gardeners' Benevolent Institution can well protect itself, and the aims of the Orphan Fund speak for it. Admit freely that the gardening fraternity, do not support these charities as they ought, and of course the difficulty is to induce individual gardeners to make a beginning; and the body of gardeners leave it to the general public, which is all very well in its way; yet, methinks the conscience of the gardeners should induce greater generosity on their part. I prefer to deal more particularly with the Royal Gardeners' Orphan Fund; and I would ask if there is one young gardener in ten who is a supporter? I hear it said, "Of what use is it to me as a single man?"—which is true to a certain degree; but the gardener's thought should go further than that. Many gardeners will know of deserving cases which have been brought under their notice; and, then, surely the question has arisen, who shall be the helper. For 5s. yearly every man is in a position not only to help the Orphan Fund, but to show his practical sympathy by voting for deserving cases. Want of thought and indolence are, I fear, the causes of this Society not being so freely supported as it should be, it being with some too much trouble to send a postal-order once a year. In regard to these most deserving and useful charities, each man should subscribe what he is able to afford without thought of his own personal needs or future benefit, but rather on the broad principle of benevolence to his class. Now, however, that I am writing, I should like to be the means of introducing to my brethren of the craft, and the trade in general, a Society not worked on charity lines, but on sound business principles, viz., The National Deposit Friendly Society, which, while providing sick-pay and medical attendance, and an old-age pension, it has a funeral-fund; and what is better, it has also a provision for banking money. Thus, a member if only paying his ordinary yearly contribution, at the end of each financial year, in the event of the member making no claim on the funds of the Society, after providing for management, funeral fund, and old age pension, has about half of his money placed to his credit as a deposit. Then a noteworthy feature of this society is, that a member can make himself a full benefit member at once by paying down this year's contribution in one sum. A member by paying 2s. per month is entitled to sick pay of 2s. per day, with free medical attendance and medicine. Should the member be married, his wife also can be in the club on very advantageous terms. The N. D. F. S. is thirty years old, with a very substantial balance, and it is a society that only requires to be known among gardeners to be highly appreciated. Another feature of this Society is, that no meetings are permitted to be held on licensed premises. I should be most happy to afford any enquiries and fuller details on application. *Stephen Castle, Bottesford Vineyards, Notts.*

AWARDS OF THE FLORAL COMMITTEE.—Surely there was a remarkable lack of appreciation of excellent culture on the part of the Floral Committee in making the inadequate award of a Vote of Thanks to the examples of *Phoenocoma prolifera* Barnesii, shown by Messrs. W. Balchin & Sons, of the Hassocks Nursery, at one of the last meetings of the Royal Horticultural Society. Whoever before had seen such heads of bloom so richly coloured on plants in 7-inch pots, the flowers highly coloured, and feathered with foliage to the very pots. These plants were five years old, and had been brought a considerable distance. It should be stated that it was only a small minority of the Floral Committee who so lamentably failed to appreciate high cultural skill. Had they been specimens of the common annual *Helichrysum* they could not have

received a less award. An occurrence of this kind is all the more regrettable, because one frequently finds the remark being made in the provinces that exhibits from a distance do not find so much favour as those contributed by London firms, however good they may be. That the conspicuous failure of justice on this occasion lends a semblance of truth to such a remark cannot be denied. I am simply voicing the opinion of many present who possess a good knowledge of hardwooded plants, when I express keen regret at this lamentable lack of appreciation of undoubted high quality. *A Fellow.*

RISE PARK, NEAR HULL.—Far away in the East Riding of Yorkshire stands the above old home of the Bethells, and a recent visit there showed that a house and gardens which have existed for some generations are still well kept up. Most interesting was the display of Roses made by some young dwarfs planted last autumn in beds of one variety each, a very effective mode of planting Roses. Among these beds, the following varieties were especially fine:—Duke of Edinburgh, Ulrich Brunner, Madame Van Houtte, and Countess of Folkestone, proving that these show varieties are of great use out-of-doors. The beds were arranged so as to converge towards a very lightly-built bower, which is made of light iron, and round which are planted all the best varieties of climbing Roses; the effect here in a few years' time will be charming. On the right of the entrance to the mansion was noticed an almost-perfection specimen of the English Yew, about 30 feet high, and covering a large area. The flower-garden, which is very artistically arranged, was already showing want of rain. In the kitchen garden some grand plots of Royal Sovereign Strawberry were pointed out, some very fine fruit pulled off the beds that morning being shown me by Mr. Allsopp, the head-gardener. Carnations are great favourites with Mrs. Bethell, and they are well done. It was cheering to see some nice beds of them, as this year in many cases they are almost a failure. The same method of keeping the varieties separate is pursued as with roses, and an especially fine bed of Mrs. Reynolds Hole among others was noticed. Under glass the chief attention is devoted to fruit-culture, and excellent crops of succession Peaches and Grapes are there seen. Although somewhat out of the way, a visit would at this time well repay anyone, as the park, which is a very extensive one, is well stocked with deer. *John Clayton.*

LACHENALIAS AND OTHER PLANTS.—The interesting notes by "R. D." in issue of the *Gardeners' Chronicle* of July 16, p. 47, induce me to refer to an old and charming species I have now in flower in the Cambridge Botanic Garden. This is *L. purpureo-coerulea*, which, unlike the kinds usually grown, has long exserted stamens. The general effect of colour is rosy-lilac; there are about three dozen or forty flowers to each scape, and they have a slight perfume. The perianth is only about one-quarter of an inch deep, and the stamens are exserted to the same extent. Each segment, when quite young, is tipped with green, and this soon turns to rosy-lilac. The scapes are about 8 inches high, mottled below, and the flowers occupy a space of about 3½ inches. The leaves are about 7 inches long, and less than three-quarters wide; they are slightly warty, after the manner of *L. pustulata*. With this in flower I have *L. aurea gigantea*, which appears to justify its additional name. Lovers of Cape bulbs may be interested to know that *Hesperantha falcata*, and *Tritonia seillaris*, are also in flower in the same group; while several other interesting things have just gone out of bloom. *R. I. Lynch.*

FRUIT CROPS IN THE BLAIRGOWRIE DISTRICT.—The *Scotsman* of Monday, July 18, 1898, says, in consequence of the scorching weather of the past week, fruit has ripened rapidly. The demand for Strawberries from the English market has been very brisk during the last few days, and several lots have changed hands at £28 per ton. There appeared to be every prospect of prices rising still further. The same applies to Raspberries, which are in good request at £37 per ton. For Black Currants about £40 per ton has been offered. When lecturing here last year, I was struck with the superior culture given to Raspberries and Black Currants. But for the fear of the Black Currant-mite, few, if any, of which were seen in the neighbourhood, Black Currants were found to be the best paying crop. There seemed, however, room for a large extension of Gooseberries and Red Currants; while it seems singular to pay £28 per ton for Strawberries in bulk for jam from the South that might be grown as well or better on the spot. *D. T. F.*

COLD VERSUS COOL STORAGE.—I entirely dissent from the claims made by your correspondent on behalf of the "fan cooler" in fruit ships. Surely it is bad enough for the Australasian fruit-growers to lose thousands of pounds by this useless process, as they did by the ruin of the fruit on the *s.s. Gulf of Bothnia*, without having its praises sung by parties unaffected by the loss. The fan-cooler process is a complete failure so far as fruit is concerned, and this will be verified by an appeal to the Colonial agents in London, who superintended the unshipment of the rotten Apples. In the same ship the fruit brought over by cold storage was perfect, and realised high prices. Parties interested in the use of "fan-coolers" should bear this in mind. *Market.*

STRAWBERRY MONARCH.—Blindness appears to be this season characteristic of the flowers of this variety. Two years ago I procured some plants which bore fruit last year, and in order to give it a fair trial I layered a number of the runners into small pots as soon as I could obtain them, and these were planted out in the month of August on a well-prepared border. The plants grew without a check, and, judging by appearances, I expected this season to be rewarded with a good crop of fruit. Such was not, however, the case, for not only was every plant blind, but also all the plants of my old stock. After reading in your last issue ("Strawberries at Maidstone") that there "20 per cent. of Monarch were blind (and the same thing occurred at Chiswick, but to a greater extent)," I am inclined to think that blindness is characteristic of the variety, or else we treat it too liberally, and it would be more productive in a poorer soil. The soil here is very heavy and moist, and Strawberries do remarkably well. I may add, from what I saw of Monarch last year, I do not consider it has anything to recommend it beyond its size. *H. Fisher, Flinton Hall Gardens, Bungay.* [Monarch may in great measure have reverted to the original Strawberry, which is delicious, as are the Hautbois. Why not try as a cure for blindness the planting of some other fertile variety coming into flower at the same season in alternate rows with Monarch? *Ed.*]

—In the autumn of 1896 I planted three beds in different parts of my ground, and two of them I allowed to bear fruit and runners in 1897, and the other bed I cut the blooms out as they appeared, on purpose to help the plant to make all the runners possible in 1897. The result this year is that the two beds that were allowed to bear fruit have had an excellent crop without any blind ones; the other bed that had the blooms taken out of the plants had a good number of blind plants. I would add, a few years back I treated an acre or two of Paxton's in the same way, by taking all the bloom off the first year, with the result when I looked for a grand crop the second year more than half were blind. I let them remain to see what they would do. The third, fourth, and fifth they were good, without any blind ones. My experience is that it is a mistake to take the blooms out, it upsets the balance of growth. *W. Horne, Cliffe.*

THE LILY FUNGUS.—I have found this disease to prevail widely in the county of Surrey, the leaves in many places having been entirely destroyed. It is interesting to note that all the same the base or autumn leaves come up very strong, in spite of the disease, and seem to be very clean and healthy. The fungus doubtless hibernates in the bulbs or soil, and is active only in the early summer. A gardener told me that he found frequent shifting of his bulbs to be productive of good results. Why should not a sprinkling of Bordeaux Mixture on to the soil about the bulbs do good after the diseased stems have been cleared away and burned? Or perhaps most good would be done by a gentle spraying with the mixture about the plants just as the flower-stems are starting into growth. With our knowledge of the potent effects of Bordeaux Mixture as a fungoid destroyer, why is it not more widely used? *A. Dean.*

DWARF SWEET PEAS.—These plants commend themselves to all lovers of sweet-scented flowers. The few notes sent are for the benefit of those of your readers who are not acquainted with the value of the above, grown in pots for decorative purposes. The variety grown here—Pink Cupid—is well adapted for pot culture. Sow the seeds in 6-inch pots, half-filled with fairly rich compost, four seeds in each pot. When six inches high, fill the pots to within an inch of the rim, pressing firmly, but carefully. Put a few neat Beech or Birch, fan-shaped twigs (not more than 18 inches high) in each pot. The plants will soon entwine themselves, and when

in full bloom, afford fine plants for greenhouse and conservatory decoration. *Henry Clayton, Blackley.*

GREEN-PODDED PEAS.—Mr. Sherwood, in his admirable paper on Peas, read at the Drill Hall on the 12th, mentioned that those varieties having green pods and Peas were by far the most popular. That is so very manifest now at every exhibition where colour is so prominent a requirement. If raisers of new Peas will recognise this fact, it will help them in their selections, and keep many varieties that are pale green out of the market. Such varieties as Sutton's Peerless, Sharpe's Queen, and the taller and fine Alderman, all make rich-coloured show Peas, and fill well also. There should also be more respect shown for good openers, the bloated pods of the Duke of Albany, Telephone, or similar types, seldom open well; they break or squash-in under the pressure of the thumb when sought to be opened. A Pea-pod that under such pressure opens the shells freely, and is then found to contain from nine to eleven not large but deep green, sweet, soft Peas, is practically one of perfect form and fitness. *A. D.*

DICKSON'S JUNE KING v. DIXON'S MIDSUMMER BROCCOLIS.—I do not know "Dixon's Midsummer Broccoli," mentioned by "H. J. C., Grimston, Tadcaster," in your issue for July 9, but I do not think that it can be in any way synonymous with "Dickson's June King." According to "H. J. C.'s" description of the former, viz., "This Broccoli has, to me, the desirable qualification that it is not over-large"—Dickson's June King, if left uncut for a sufficiently long period, will develop into a very large head; but for private gardens it is not desirable to do so. June King is exceedingly dwarf in habit, and therefore less liable to be injured by the winter frosts, no stem being visible above ground. It makes the most of its growth in the spring, and is the hardiest and latest of any Broccoli that I know, and I believe I have grown most of the leading varieties. I did not start cutting Broccoli June King this season until the first week in June (after I had finished cutting Late Queen, Model, and all other late varieties), and it supplied us with heads till the earliest Cauliflowers came in. As Mr. Burbury, on p. 8, says, "It is a variety that is sure to be extensively grown when better known." Indeed, it is a variety when once grown will be always grown. *James Campbell, Methley Park, Leeds.*

ASTRAGALUS ALPINUS ALBUS.—*Astragalus alpinus* is one of the rarest and most beautiful of Scottish alpine plants. Only two stations were known in Scotland where it was to be found previous to 1884—one at Little Craigendal, in Aberdeenshire, the other at the head of Glen Dole, Clova, in Forfarshire. A third station was discovered for this plant in 1884 by Mr. P. Neill Fraser, of Rockville, Murrayfield, who found it growing in abundance on Ben Vrackie, a mountain near Pitlochrie, in Perthshire, where it has probably been growing for centuries, judging from the present condition in which it is flourishing on this well-known mountain. At the end of June, 1896, I gathered and brought home a few plants of *Astragalus alpinus* from this station to grow in my garden. I selected a few clean patches entirely free from weeds. The plant was not in flower at the place they were gathered. Since then they have grown luxuriantly, but only came into flower a few weeks ago. I was surprised to find several plants bearing white flowers, intermixed with the typical pale blue form of *Astragalus alpinus*. They are now forming seed very freely. There is in cultivation a well-known white variety of *Astragalus hypoglottis*, but I cannot find any record of a white variety of *Astragalus alpinus* having been known previously. *Robert Lindsay, Kaimies Lodge, Murrayfield, Midlothian.*

SHIRLEY POPPIES.—In driving through some of the seed-growing districts lying between Great Bad-dow and Colchester, one frequently comes upon a breadth of Shirley Poppies standing for seed, and it is seen that the prevailing tint of colour is rose—from soft pink to deep rose. Seen at a distance of half a mile or so, there is a singular softness of hue, contrasting in a remarkable manner with the crimson of *Malope grandiflora*, and the dark crimson *Mignonette*. As Shirley Poppies often transplant badly, it is best to sow the seeds thinly, as thinly as possible, in drills where they are to blossom, and then they bloom most abundantly. The seeds are very small, and so it comes to pass in this case, as in that of other small-seeded annuals, there is a tendency to sow too thickly. But few appear to have the courage to thin-out plants to the extent that is desirable. *R. D.*

A VETERAN FLORIST.—I am still growing a few seedling Fuchsias, but did not sow the seed till March 1. I have nearly three dozen seedlings from *F. fulgens* looking like young giants, some showing bloom. The foliage of the same is very telling in its tints, and really one might designate these Fuchsias, foliage plants. *Fuchsia fulgens* was sent out in 1837, the year that I left my home. If the plant be well handled, it soon makes an object of beauty. Amongst my seedlings I should like to find a white-flowered variety, but I do not expect to succeed in my quest. *George Fry, Lewisham, S.E.*

A SEEDLING CARNATION.—I am sending you a few blooms of one of the seedlings raised from "Mrs. Leopold Rothschild." My object in doing so is not so much on account of any value I attach to its merits, but more for the interest I feel in Old-Lang-Syne. I have had to do with Carnations more or less since 1832, so that my interest in this popular and charming class is of long standing. The variety sent properly belongs to the tree or perpetual section. It is not devoid of fragrance, and has the all-important qualification of being a persistent non-burster. Numerous as the blooms have been produced, I have not seen one that has shown the slightest disposition to upset the calyx in its entirety. Commercially, I am not seeking or attaching any value of more than ordinary interest. We, in the year of grace 1898, abound in an endless variety of grand varieties of border and pot-plants, in fact, their importance as decorative subjects cannot be over estimated. My experience, as regards the raising of Carnations from seed, is one of intense pleasure, and it is marvellous what can be produced by judicious fertilisation of only a few of the best kinds, and the crossing of the choicest cardinal colours. I have been in my small way much surprised and intensely delighted in the issue of events in this mind-elevating occupation and pastime. My plants during manipulation are under glass, and it is quite the exception for me to see in the result of my labours a single flower produced. *Geo. Fry, F.R.H.S., Lewisham, S.E.* [A regularly-formed deep scarlet-coloured flower, with a fair amount of fragrance, excellent at any season. *Ed.*]

SOCIETIES.

MALDON HORTICULTURAL.

JULY 13.—This Society held its twenty-fourth annual exhibition of plants, cut flowers, fruit, and vegetables, in the grounds of Hill House, on the date given, and as regards the number and the quality of the exhibits—there were 450 entries in the open classes—was the best it has yet held.

Groups of pot-plants arranged for effect along the centre of one of the four large tents were extremely good in design and materials, and Messrs. Saltmarsh, Smee, and Pyman, took the prizes in the order of their names. The most successful exhibitors were Mr. S. Kerry, gr. to CHRISTOPHER W. PARKER, Esq., Hatfield Priory, Witham, who was the winner of thirteen 1st prizes; Mr. GEORGE PYMAN, Mr. SALTMARSH, Mr. THOROGOOD, and Messrs. REEVES, WILLSHER, and E. SMEE, who all showed well in the open and local classes.

Cut Flowers.—Mr. WILLSHER had the best twenty-four Roses, distinct, staging fresh, even blooms, of much substance, of leading varieties. Dr. J. H. SALTER had the best stand of twelve, and he was closely pressed by Dr. F. H. COOKE, who had the best stand of Teas. Mr. KERRY was 1st in a good class for twelve kinds of herbaceous plants, and which included some grand spikes of *Alstroemeria aurea* and other varieties.

Fruit.—Mr. KERRY was 1st for four kinds, staging good Black Hamburg and Muscat of Alexandria Grapes, Nectarines, Peaches, and grand fruits of Waterloo Strawberry.

Vegetables were extensively shown, and for the most part in fine condition, and Mr. KERRY was 1st for a collection of six kinds, namely, Pea Boston Unrivalled, Cauliflower The Pearl, Tomato Carter's Perfection, Carrot Model, Potato Ashleaf, and Turnips Six-weeks. *H. W. W.*

NATIONAL ROSE.

JULY 14.—The Northern provincial show of this Society was held on the above date in the gardens of Spring Hall, Halifax, by the kind permission of Clement Houldsworth, Esq., J.P., President of the Salterhebble and District Rose Society. Favoured with fine weather, and an abundance of excellent entries, the visit of the National Rose Society to the Salterhebble Rose Show was exceedingly fortunate, and the display was a grand one. The following were the chief prize-winners:—

NURSERYMEN.

For seventy-two blooms, distinct varieties, the winners were Messrs. HARKNESS & SON, 1st, with a very uniform lot of good blooms, including such favourites as Dr. Andry,

Charles Darwin, Captain Christy, &c. B. R. CANT, Colchester, was 2nd, and F. CANT, Colchester, 3rd.

For thirty-six distinct varieties, also in this class, three blooms of each, Messrs. HARKNESS & SON were again the 1st in a very keen competition, and their exhibition called for a general expression of admiration; ALEX. DICKSON & SON, Newtownards, 2nd; and B. R. CANT, Colchester, was 3rd.

In the class for thirty-six blooms, distinct, the 1st prize and Trophy Gold Medal was won by Messrs. HARKNESS & SON, of Bedale, whose very good collection included Ernest Metz, Catherine Mermet, Marie Verdier, Charles Darwin, Her Majesty, Maréchal Niel, White Lady, Madame Cusin, Duke of Edinburgh, Caroline Testout, Kaiserin Augusta Victoria, &c. The 2nd prize went to Messrs. B. R. CANT, Colchester; 3rd, F. CANT, Colchester, both exhibitors having especially meritorious stands.

In Division B, the best thirty-six blooms of distinct varieties were those shown by Messrs. J. TOWNSEND & SON, Worcester, being 1st with good examples of Prince Arthur, Reynolds Hole, and Horace Vernet; Messrs. J. BURRELL & CO., Cambridge were 2nd; Mr. HENRY NORTON, Louth, was 3rd.

In the same division was a class for eighteen distinct varieties in triplets, and here Messrs. TOWNSEND & SON were 1st, Messrs. S. COOLING & SON of Bath were 2nd, and Messrs. J. R. PEARSON & SONS, Chilwell, 3rd.

The Tea and Noisette section, open to nurserymen, the best eighteen blooms, distinct, were those sent by Mr. GEORGE PRINCE of Oxford, who showed grand blooms of good substance; Mr. B. R. CANT was 2nd; and Messrs. PAUL & SON, Cheshunt, 3rd.

For twelve distinct Teas or Noisettes.—1st, Mr. MATTOCK with a good box of choice varieties; 2nd, Messrs. BURRELL & CO., Cambridge.

Open to nurserymen and amateurs alike.—In these classes there was great competition, no greater number than twelve blooms being required.

For twelve new Roses, distinct, A. DICKSON & SONS, of Newtownards, was 1st, showing a grand lot, most of which, if not all, being of their own introduction, they included Mrs. Ed. Mawley, Ulster, Countess of Caledon, Mildred Grant, Ard Roon, Mrs. Conway Jones, Alice Graham, Lady Mizra Beauclerc, Duchess of Portland, Helen Keller, and Bessie Brown. 2nd, Messrs. F. CANT & CO., whose stand included good blooms of Mrs. Frank Cant, and Mrs. W. J. Grant.

For twelve blooms of any White Rose, Mr. GEO. PRINCE staged a lovely box of Kaiserin Augusta Victoria, which was awarded 1st prize. 2nd, Mr. B. R. CANT for Marchioness of Londonderry. In this class there was very keen competition, twelve lots being staged.

For twelve yellow Roses, Mr. GEO. PRINCE again took the highest honour with a charming dozen of Comtesse de Nadaillac. 2nd, Mr. J. MATTOCK, for the same variety.

For twelve blooms, any light-pink or rose-coloured Rose, Messrs. HARKNESS won with Mrs. Jno. Laing, a fine lot. 2nd, JAS. TOWNSEND & SON for the same variety.

For twelve blooms, light or dark crimson Rose, Messrs. J. TOWNSEND & SON were 1st with Gustave Piganeau. 2nd, B. R. CANT.

In the class for new seedling Roses great interest was centred, the result being the awarding of the Gold Medals to a lovely Tea Rose, Mrs. E. Mawley, exhibited by ALEX. DICKSON & SON, also to Mildred Grant, which was exhibited by the same firm.

Messrs. J. COCKER & SON received the same award for Mrs. James Cocker, a bloom having some resemblance to Mrs. John Laing.

In the Tea and Noisette section Messrs. A. DICKSON & SONS also exhibited sprays of a lovely single white Tea Rose, most distinct yellow stamens; this the Committee desired to see again.

Garden or Decorative Roses.—These were shown under the usual restrictions in bunches. The 1st prize for eighteen distinct varieties arranged in 6 feet space was taken by Messrs. PAUL & SON, of Cheshunt—a charming lot; H. V. MACHIN, Esq., being 2nd; G. COOLING & SON, Bath, 3rd.

In the class for a display of Roses arranged for effect, in a space not less than 6 feet by 3 feet, or 12 feet by 3 feet, Mr. GEO. PRINCE, of Oxford, staged a lot of grand blooms, including quite a number of Comtesse de Nadaillac, generally good this year; and Messrs. JAS. TOWNSEND & SON were 2nd. This class, we think, can be made most attractive, as was proved at the Newcastle show last week.

THE AMATEUR'S SECTION.

The Jubilee Trophy, which goes with the 1st prize, for twenty-four blooms distinct, was carried off by E. B. LINDSELL, Esq., Hitchin, who showed grand blooms of Madame Eugénie Verdier, Madame Cochet, Madame Haumann, Souvenir d'Elise Vardon, Suzanne-M. Rodocanachi, Alf. Colomb, Muriel Graham, Capt. Hayward, Earl of Dufferin, Innocente Pirola, A. K. Williams, Her Majesty, Beauty of Waltham, François Michelin, Ulrich Brunner, Marchioness of Londonderry, Gustave Piganeau, &c. The Rev. J. H. PEMBERTON, of Havering-atte-Bower, was 2nd with a twenty-four, which included superlative blooms of Lady Mary Fitzwilliam and S.-M. Rodocanachi. There were in this class six entries.

In a class open to amateurs, irrespective of the number of plants they grow, thirty-six blooms distinct, E. B. LINDSELL, Esq., was again 1st with a splendid even lot of blooms, including Marie Baumann, Earl of Dufferin, Madame de Watteville, The Bride, A. K. Williams, Merveille de Lyon, Gustave Piganeau, Marchioness of Londonderry, La France, Horace Vernet, Madame Hoste, Helen Keller, Madame de Cochet, &c.; H. V. MACHIN, Esq., Worksop, 2nd, with a stand that included a grand bloom of Mrs. W. J. Grant.

For eight distinct varieties, three blooms of each, E. B.

LINDSELL, Esq., again took the 1st prize, showing good Alf. Colomb, Her Majesty, Comtesse de Nadaillac, Ulrich Brunner, Mrs. John Laing, François Michelin, &c.; and Rev. J. H. PEMBERTON was 2nd.

For nine blooms of any Rose except Teas or Noisettes, H. V. MACHIN, Esq., 1st, with excellent blooms of Ulrich Brunner; E. B. LINDSELL, Esq., 2nd, with Her Majesty; Rev. J. H. PEMBERTON 3rd, with Mrs. John Laing.

For eighteen blooms, distinct varieties, OSMOND ORPEN, Esq., Colchester, 1st, he showing Mrs. W. J. Grant, Catherine Mermet among others, all good; SAM BERGEN, Esq., Knebworth, 2nd.

For twelve blooms, distinct, Mr. GEO. MOULES, of Hitchin, took 1st in a class of nine competitors; R. HOBBS, Worcester, 2nd.

In the section for Tea or Noisette Rose grown by amateurs, twelve distinct, Mr. A. H. GRAY, Bath, came 1st, showing Bridesmaid, Maréchal Niel, Cleopatra, Comtesse de Nadaillac, &c.; OSMOND ORPEN, Esq., 2nd.

For six blooms of new Roses, open to all amateurs, the Rev. J. H. PEMBERTON took 1st.

For twelve distinct varieties of garden or decorative Roses there was good competition, and some charming varieties shown; the premier award being won by H. V. MACHIN, Esq., who showed W. A. Richardson, Gustave Regis, Gloire de Polyantha, &c.; 2nd, Rev. J. H. PEMBERTON, Havering, his stand including a fine bunch of Rambler.

In the local classes for bouquets of Roses, &c., the chief awards were taken by Mr. TOM FARRAR, of Halifax, and Messrs. CALEN & SON, of Heath, both of whom showed very excellent taste in their arrangements.

In the class open to Rose growers of Halifax and district the premier award was taken by Mr. H. CONWAY.

During the afternoon a meeting was held in a tent on the show ground, at which, under the presidency of Archdeacon BROOKE, Vicar of Halifax, an exhaustive paper on Rose exhibiting was read by Mr. G. PAUL, V.M.H., and at the close of the reading of the paper a spirited discussion ensued, in which Mr. ALEXANDER DICKSON, Mr. COOLING, Mr. F. CANT, Rev. H. PEMBERTON, and others took part.

KENILWORTH HORTICULTURAL.

JULY 14.—The fifth annual exhibition of the above Society was held on the above date, in brilliant weather. The Earl of Clarendon not only granted permission to the committee to hold the exhibition in the Castle grounds, but kindly undertook to open the show also. The exhibition was decidedly superior to that of previous years.

The exhibits were displayed in two large tents, and in one of these was an honorary exhibit from the Right Hon. Lord LEIGH, Stoneleigh Abbey (gr., Mr. H. T. Martin). This group of very fine plants included immense Kentias and Arecas, intermingled with well-coloured Codiaeums and Eulalias; also Asclepias curassavica, Francoa ramosa, Rhodanthes, and Caladium argyrites. A handsome group of plants of hybrid Streptocarpus, intermixed with Maidenhair Ferns, was also from Stoneleigh Abbey gardens.

W. T. PEARNS, Esq., Parkfield House, Kenilworth (gr., Mr. Everitt), staged a charming group of foliage and flowering plants.

Mr. DEVERILL, of Banbury, exhibited bunches of flowers of herbaceous perennials, in sixty varieties, amongst which was the new *Coreopsis* var. *lanceolata grandiflora*.

Mr. FRED PERKINS, nurseryman, Leamington, had an attractive exhibit in his new Carnation Primrose Queen, also a large stand of Roses, Sweet Peas, and herbaceous perennials. Mr. W. FINCH, of Coventry, showed his new and promising Codieum, named *Distinction*. Messrs. HINTON BROS., of Warwick, staged a fine collection of Sweet Peas in variety.

The competitive class for the best group of plants made an excellent show. G. BEARD, Esq., Thickthorn, Kenilworth (gr., Mr. Snow), gained 1st honours; and F. B. WRIGHT, Esq., Warwick (gr., Mr. J. Huckwell), 2nd. F. B. WRIGHT, Esq., took 1st place for specimen foliage plants, his most noteworthy plant being one of *Cycas revoluta*.

For six specimen flowering plants, F. B. WRIGHT, Esq., was well to the front, and this exhibitor also showed fine specimen Ferns.

The fruit staged was of high quality. Strawberries (for the cultivation of which the district is noted) were excellent, and many dishes and baskets of fine fruits were displayed. Sir J. Paxton, Royal Sovereign, and Waterloo were noted as the best shown. Currants, black and red, were shown in quantity. Lord LEIGH sent a collection of ten dishes in as many kinds of fruit. The cottagers' tent contained many excellent exhibits of vegetables, fruits, and flowers.

READING HORTICULTURAL.

JULY 14.—The Summer Show of the above Society was held in the Fosbury Gardens, in a series of tents decidedly too small for the purpose, which caused much crowding of the exhibits, and left but little space for locomotion. The usual exhibition place within the Abbey ruins was on this occasion fitted up for pastoral plays.

Groups of plants arranged for effect were a leading feature, and in one class the Reading Horticultural Society's Cup was offered. This was won by Mr. H. Woolford, gr. to ALFRED PALMER, Esq., with a bold and admirably-finished arrangement, rich in foliage and flowering plants. At the back of the group were two fine specimens of *Cocos plumosa*, with only a small Palm between them, dispensing with the large

central back ground specimen, which is generally thought indispensable. The effect of the group was decidedly heightened by departure from the usual custom.

The Sutton Challenge Cup, offered in another class for a large group, was won by Mr. Peel, gr. to Miss TODD, Shirley. This, unlike the semicircular shape carried out by Mr. Woolford, was in the form of a square, having, as a background, elegant Palms, smaller specimens of which were also used nearer the front, dot-plants of *Papyrus anti-quorum*, very effective; raised plants of *Nepenthes*, several handsome pendent *Crotons*, blue *Hydrangeas*, &c. Mr. WOOLFORD was 2nd.

In the gardeners' and amateurs' division, there was but one group, and the 1st prize was awarded to Mr. Chamberlain, gr. to F. M. LONERGAN, Esq., Cressingham Park. Mr. PEEL was the only exhibitor of eight stove and greenhouse plants.

In the amateurs' division, Mr. Leith, gr. to A. B. W. THORNTON, Esq., Beaupaire Park, was 1st, having *Cycas revoluta*, a good example of the *Swansonia galegifolia*, and two others; he also had the best six fine foliaged plants.

Mr. WOOLFORD had the best six stove and greenhouse Ferns, and Mr. LEITH was 1st with four foliaged plants. The best specimen stove and greenhouse plant was *Ixora coccinea* from Mr. PEEL.

Three charming specimens of Orchids were exhibited by Mr. WOOLFORD, consisting of *Cattleya Gaskelliana*, *Epidendrum vitellinum*, and *Cynoches chlorochilum*.

Some very pretty plants suitable for table decoration were staged by several exhibitors.

Fuchsias were nicely shown by Mr. BRIGHT, of Whiteknights. Double *Pelargoniums* were poor, but tuberous-rooted *Begonias* were fine, Mr. WOOLFORD taking the 1st prize with some excellent plants; the 2nd prize going to Mr. R. BASSIL. The best three Palms came from Mr. LEITH.

Roses formed the bulk of the cut-flowers, one tent being set apart expressly for them. With thirty-six varieties Mr. C. TURNER, Slough, and Mr. J. MATTOCK, Oxford, were placed equal 1sts.

Mr. MATTOCK had the best eighteen Teas and Noisettes, staging very good blooms.

The best twelve blooms of any one variety were beautiful ones of Mrs. J. Laing, from Mr. C. TURNER.

Mr. CAMBRIDGE, Aldermaston, had the best twenty-four blooms in the local classes; Mr. J. R. TRANTER, Henley, was 2nd. And they occupied the same positions with twelve Teas and Noisettes.

The best twenty-four varieties in the amateurs' division were from Mr. P. BURNAND, Reigate; Mr. Mease, gr. to A. TATE, Esq., Leatherhead, was 2nd.

Mr. MEASE had the best twelve Teas; Mr. W. C. ROMAINE, Windsor, was 2nd.

There were several local classes, and one for garden Roses brought fine bunches.

FRUITS AND VEGETABLES.

Mr. J. McHATTIE, gr., Strathfieldsaye, staged the best six dishes of fruit, having Black Hamburgh and Buckland Sweetwater Grapes; Violette Hative Peach, Lord Napier Nectarine, smooth Cayenne Pine and a Melon, a very good lot; Mr. TURTON, gr., Maiden Erlegh, was 2nd. Mr. OSMAN, gr., Ottershaw Park, had the best three bunches of Black Hamburgh Grapes, finely coloured; Mr. WOOLFORD was 2nd. Any other black was represented by good Madresfield Court from Mr. Tidy, gr. to W. K. D'ARCY, Esq., Stanmore Hall; Mr. GALT, gr. to C. E. KEYSER, Esq., Aldermaston, was 2nd. Mr. GALT had the best three bunches of white Grapes, staging Duke of Buccleugh.

Messrs. SUTTON & SONS' special prizes for nine kinds of vegetables brought several collections, all of which were of fine quality. Mr. R. LYE, gr., Sydmon Court, Berks, was 1st; Mr. C. J. WAITE, gr., Glenhurst, Esher, 2nd.

MISCELLANEOUS.

Mrs. PHIPPEN, floral decorator, Reading, had some charming arrangements in flowers, showing originality in design, and fine taste in execution. Messrs. WEBB & SONS, Wordsley, Stourbridge, showed bunches of Sweet Peas. Mr. F. G. FOSTER, Brockhampton Nurseries, Havant, had also Sweet Peas; and Mr. W. TAYLOR, Hampton, a box of excellent cut Roses. A group of very good Malmesbury Carnations was staged by Mr. GALT.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT.

JULY 16.—The fourth annual outing of the above Society took place on the above date, when about thirty members journeyed to London to view the gardens of the Royal Horticultural Society, Chiswick, and those of Gunnersbury Park, Acton, the former by kind permission of the Council, and the latter by that of Leopold de Rothschild, Esq.

On the arrival of the party at Chiswick, they were met by the Superintendent, Mr. S. T. WRIGHT, who conducted the party over the gardens, pointing out everything likely to be of interest to gardeners. After two hours spent here, the party were conducted by Mr. WRIGHT to Gunnersbury Park, where they were met by the head gardener, Mr. G. REYNOLDS, and by Mr. HUDSON, head gardener at the adjoining Gunnersbury House. But before proceeding to inspect the grounds, the party sat down to luncheon, hospitably provided by L. de Rothschild, Esq.

A ramble through the ornamental part of the park, the glasshouses, &c., was much enjoyed. The party then visited the Gunnersbury House gardens.

CARDIFF HORTICULTURAL.

JULY 20, 21.—Upon all previous occasions this Society has held its annual show towards the close of August, but the committee has made an innovation by holding it this year on the above dates, with a view to obtaining an increased attendance, so many people leaving the town during August for the holidays. This purpose they achieved upon the opening day at least, and it is gratifying to record that, with the exception of fruits and vegetables, the innovation has resulted in a wider and keener competition in most of the classes.

That the fruit display should have suffered is to be regretted, for hitherto the Cardiff show has held a prominent position in this respect, the fruit exhibits being amongst the finest in the provinces; but the position could not be retained a month earlier in the season.

The weather—a most important factor in the success of a flower show—was ideal, and the grounds of the Sophia gardens looked their very best, and have many shaded avenues and verdant lawns, which lend facilities for the dispersion of marquees and tents in a charming manner.

Plants.—The marquee devoted to the groups of miscellaneous plants arranged for effect was one of the chief attractions. The premier position for a group of plants in and out of bloom, arranged to produce the best effect, and occupying a space of 100 square feet, was easily secured by Mr. JAS. CYPHER, Cheltenham. His arrangement was charmingly light and graceful, and the effect was enhanced by a light cork bridge construction, surmounted by a Cocos Palm and medium-sized plants of *Humea elegans*, and festooned with Ferns, Asparagus, and other light drooping plants. Four very fine plants of *Humea elegans* had a wonderful effect upon the whole, and numerous plants of the Japanese Maple proved quite a feature. Rockwork was employed in the foreground, and some well-coloured Crotons and plants of the new *Acalypha Sanderi* gave a distinctness to the arrangement both commendable and pleasing. Mr. RALPH CROSSLING, Penarth, was a good 2nd, but with quite a different arrangement, lacking the characteristic lightness of the former group. The plants, however, were good specimens. Messrs. CASE BROS., Cardiff, were 3rd, with a somewhat heavy compact group, comprised chiefly of Liliacs and Gloxinias.

For the group of plants arranged to produce the best effect, occupying a space of 50 feet, open to amateurs only, Mr. W. Carpenter, gr. to W. J. BUCKLEY, Esq., Llanelly, took 1st position with a very pretty group, including *Celosias*, *Lilium auratum*, *Anthuriums*, and well-coloured *Acalyphas*, *Dracenas*, and *Crotons*; the 2nd prize was won by Mr. J. Howe, gr. to G. RUTHERFORD, Esq., Dulwich House, Cardiff.

In the groups of miscellaneous plants, covering 25 feet, Mr. H. Rea, gr. to C. WALDRON, Esq., Llandaff, was 1st.

In the specimen plant section, Mr. CARPENTER was 1st, for six stove and greenhouse Ferns, with *Cyathea dealbata*, *Dicksonia antarctica*, *Adiantum Williamsii*, *Gymnogramma peruviana argophylla*, and *Davallia Mooreana*; Mr. Malpas, gr. to J. LYNN THOMAS, Esq., Green Lawn, Cardiff, was 2nd.

For six stove and greenhouse plants in bloom, Mr. LOCKYER, gr. to J. C. HANBURY, Esq., Pontypool Park, was 1st with good trained plants of *Ixora Williamsii*, *Phenocoma prolifera*, *Statice profusa*, *Anthurium Scherzerianum*, *Bougainvillea Sanderiana*, and *Gloriosa superba*. 2nd, A. T. ROBINSON, Cardiff. Mr. LOCKYER had the best specimen stove and greenhouse plant in a well flowered *Clerodendron Balfouriana*.

Mr. DAVIS, of Yeovil Nurseries, took 1st prize for the best twelve plants of tuberous-rooted Begonias in not fewer than six varieties, showing a capital group.

Cut Flowers.—In the cut-flower section the competition for Roses was very keen, there being magnificent collections from many parts of the kingdom.

For the best twelve varieties of H.P.'s in trebles, Messrs. TOWNSEND & SONS, Worcester, were first with perfect examples of Mrs. John Laing, Marchioness of Londonderry, A. K. Williams, Caroline Testout, Merville de Lyon, Duke of Wellington, &c.; Messrs. COOLING & SONS, Bath, occupied 2nd position.

For twelve Tea Roses, in trebles, Messrs. TOWNSEND & SONS were again 1st, showing Madame de Watteville, Caroline Testout, Comtesse de Nadaillac, Madame Cusin, Francisca Kruger, The Bride, Ernest Metz, Souvenir de Etienne Levet, Innocente Pirola, Maréchal Niel, Catherine Mermet, and Jean Ducher; A. HILL GRAY, Esq., Bath, was 2nd in this class.

For twenty-four H. P. blooms, distinct, Messrs. TOWNSEND & SONS excelled Mr. STEPHEN TRESEDER, Cardiff, who, however showed commendably.

For eighteen distinct varieties of Teas, Mr. JOHN MATTOCK, Oxford, beat Messrs. D. & W. CROLL, Dundee.

The best H.P. Rose, shown in a group of twelve blooms, any one variety, was Horace Vernet, from Messrs. TOWNSEND & SONS, and Mr. JOHN MATTOCK, Oxford, had the best dozen blooms of any Tea Rose, showing magnificent specimens of Comtesse de Nadaillac.

There was a class also for a collection of Roses shown with their own foliage and buds, and in this interesting competition Mr. J. MATTOCK was 1st and Mr. R. CROSSLING, Penarth, 2nd.

Seedling Carnations in a competitive class were best from Mr. W. TRESEDER, Cardiff, who was also first for a collection of hardy flowers.

Florists' Exhibits.—The Cardiff Show has been noted for the very fine exposition of artists' specialties made there, but this year the display and competition in these classes was especially good. As on former occasions, the local competitors have succeeded in holding the best positions.

Fruit was not so good as usual, as we have already remarked; but Mr. Hollingsworth, gr. to Miss TALBOT, Margam Park, showed some very fine bunches of Black Hamburg Grapes, and a dish of Peaches, which deservedly took 1st prizes. Melons were lamentably poor.

With respect to vegetables, the entries were few, but the quality was high.

Trade Exhibits.—Though there were many very commendable honorary exhibits, that from Mr. W. TRESEDER, Cardiff, which was awarded the Cup offered by the Mayor of Cardiff, this year for the first time surpassed all others. His collection of Cactus Dahlias was splendid for so early a date. Amongst the conspicuous varieties were Mrs. Wilson Noble, a lovely, salmon-coloured variety; Starfish, an excellent scarlet flower; Lady Penzance, primrose; and Cinderella. The display of hardy perennials, too, was grand, and the coveted prize of the Cup was well deserved by this exhaustive exhibit.

Messrs. ECKFORD's collection of Sweet Peas was up to the usual standard of his exhibits, and being arranged lightly with grasses, was charming. Fascination, Duke of Westminster, Duchess of Westminster, Mrs. Dugdale, Lady Mary Currie, Othello, and Senator were particularly fine varieties.

Messrs. DOBBIE & SONS, of Rothesay, N.B., staged some nicely-arranged exhibits of Violas, Sweet Peas, and Pelargoniums, for which the firm enjoys a well-earned reputation.

Messrs. GARRAWAY, of Clifton, showed a clean healthy lot of stove and greenhouse plants. Mr. W. J. GODFREY, Exmouth, displayed to advantage Cannas, Sweet Peas, and hardy flowers. Messrs. BARR & SONS, King Street, London, brought from Ditton a collection of hardy perennials; and Mr. B. R. DAVIS, Yeovil, showed some splendid blooms of tuberous Begonias.

THE SCOTTISH HORTICULTURAL ASSOCIATION, EDINBURGH.

JULY 20.—From 2 to 6 P.M. an exhibition was held in the Albert Hall, Shawdrick Place, which was, horticulturally, a decided success. The trade, as is usual, and many private gardeners, supporting it capably, and filling the tables with an abundance of good things. This is the more creditable to all concerned, as no money prizes are offered by the association, only certificates awarded, excepting to superior novelties and excellence of culture. Admission to the show was without charge, but instead a collection was taken on behalf of the gardeners' charities as the public left the hall. The weather was brilliant, the attendance good, and it is hoped that the receipts will prove sufficient encouragement to the holding of an annual summer show in Edinburgh.

The trade tables were well furnished, that of Mr. A. B. LAIRD at the end of the Hall being richly set out with Palms in variety, and other foliaged plants of *Clerodendrons fallax*, *Carex elegans*, *Ophiopogon Jaburan foliis variegatis*, *Asparagus*, *Dracenas*, *Eulalia zebrina*; and some half a dozen wooden posts or pillars in front were very skilfully rendered verdant with Smilax, and crowned with white-flowered Lilies.

Mr. JOHN DOWNIE had a table richly furnished with fine Palms, Cladiums, Cannas, Ferns, Begonias, one a new crimson-coloured variety of unusual size and smoothness of form. He had a fine thrifty plant of *Dracena Goldseiffiana*, and a specimen of the remarkable *Acalypha Sanderi*.

Messrs. DICKSON & Co., had a choice collection of Pinks, tufted Pansies, and Violas, about eighty of the finest varieties of the best in cultivation. In this collection was also shown one of the most striking variegated plants yet seen in Sambucus racemosa serratifolia var. aurea; a remarkable collection of garden, Polyantha, and monthly Roses; *Hedysarum multiflorum*, from Mongolia, a charming shrub, covered with Pea-shaped flowers; *Veronica Purple Queen*, *Hypericum densiflorum*, *Spiraea callosa*, *Cytisus hirsutus*, but little known, being a shrub that flowers throughout the summer.

Messrs. JAMES COCKER & SONS, Aberdeen, staged a fine collection of more than 100 bunches of herbaceous perennial plants, rich in Delphiniums and Irises; and thirty-six bunches of garden Roses. Among the last-named Bronte's Inconstant was probably the most striking variety, although the following were very rich, Laurette Messimy, Perle d'Or, Madame Hoste, Sorella, and Marie Van Houtte.

Messrs. J. GRIEVE & SONS, of Red Braes, had a table chiefly filled with *Araucaria excelsa*, *Pandanus*, Ferns, and Palms, with masses of Violas between them. Mr. W. CUTHBERTSON, of Rothesay, showed a fine table of herbaceous perennial plants, and Messrs. LAIRD & MATHER, of Kelso, a new crimson-flowered Souvenir de la Malmaison Carnation. The following growers contributed fine collections of Roses, viz., Messrs. COCKER, Aberdeen; HUGH DICKSON, Stranraer, Belfast; T. SMITH & SONS, Stranraer, and B. W. CROLL, Dundee. I believe a Certificate of Cultural Merit was awarded the exhibitors from Stranraer for their Roses, which were especially noted for the size and clearness of their outer petals. There were also Roses from private growers and from the grower, Trinity, including a fine vase of blooms of Niphetos, which is remarkably well grown by Mr. MCKENZIE.

The chief table decorations consisted of Iceland Poppies and Roses, of which more anon.

There was a fine collection of Strawberries on view and for tasting. Mr. McIntyre, gr. at The Glen, Inverloithen, Peebleshire, sent Strawberry Glen Diamond, a variety that was new to me; and President, of remarkable goodness. Mr. BAIN, gr., Hadfast, sent one dozen dishes of Royal Sovereign.

Mr. ALEX. KIRK, gr., Norwood, Alloa, sent nine dishes of Strawberries, one of them being Queen of Denmark. Mr. J. CARMICHAEL sent Latest-of-All, Princess of Wales, Garibaldi, Royal Sovereign, and Competitor, a large cockscomb-shaped fruit. Strawberries from Mr. Comfort, gr. to Mr. HAY, Broomfield, consisted of Bicton Pines (named Bicton Hall), still our best white-fruited variety; John Ruskin, Latest-of-All, and Royal Sovereign.

Mr. WM. TEMPLE, gr., Carron House, Carron, sent dishes of Duke of Edinburgh Strawberry, very fine, said by some experts to be identical with James Veitch; and of Royal Sovereign; from Mr. MATTISON, Currie Hall, Currie, there were dishes of Duke of Edinburgh and Royal Sovereign; from Mr. GEORGE WOOD, gr., Oswald House, Royal Sovereign; from Mr. MCKENZIE, The Grove, Trinity, came Scarlet Queen, John Ruskin, Waterloo, Garibaldi, Royal Sovereign, and a fine spray of Waterloo—a fine exhibit for so small a private garden.

Mr. DUNN of Dalkeith sent a fine exhibit, consisting of eighteen dishes and ten bunches, in order to show the fruiting character of the varieties. The bunches were one of Red and another of White Alpines, raised annually from seed; Auguste Nicaise, James Veitch, Garibaldi, Belle de Medici, Ferdinand d'Orleans, Jubilee, Prince of Wales, and Queen of Connaught. There were also fine dishes of the following:—Two of Royal Sovereign, three of James Veitch, two Scarlet Queen, two of Garibaldi, one British Queen, one Queen of Denmark, one Richard Gilbert, one Princess of Wales, one Red and one White Alpine, one Veitch's Perfection. The latter is not quite ripe, though the flavour is good. D. T. F.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 16, is furnished from the Meteorological Office:—

"The weather was again fine and bright in nearly all parts of the kingdom, the only rainfall recorded being slight quantities on our extreme north-western coasts, and still slighter amounts at some of our south-eastern stations.

"The temperature was a little above the mean in most districts, but only just equal to it in 'England, S.,' and rather below it in 'England, E., N.E., and N.W.' The highest of the maxima occurred towards the end of the week, when they ranged from 85° in 'England, S.' (at Southampton), and from 81° or 80° in several other parts of England and in 'Scotland, E.,' to 77° or 76° in Ireland, 74° in 'Scotland, N. and W.,' and to 73° in 'England, N.W.' At

the commencement of the week the maxima recorded over the south and east of England were very low. The absolute minima, which generally occurred either on July 11 or 14, varied from 37° in 'England, E.,' 88° in 'Scotland, E. and W.,' and 89° in the 'Midland Counties,' to 48° in 'Ireland, S.,' and to 52° in the 'Channel Islands.' At Cullompton, on July 14, a thermometer exposed on the grass fell as low as 81° 4°.

"The rainfall was almost entirely absent from England and 'Ireland, S.,' but slight falls were experienced at times in Scotland and 'Ireland, N.'"

"The bright sunshine exceeded the mean in all districts, the excess being very considerable in most places. The percentage of the possible duration ranged from 69 in the 'Channel Islands,' and from 57 in 'England, S.W.,' 56 in 'England, N.W.,' and 52 in 'England, E. and N.E.,' to 44 in 'Scotland, E.,' 37 in 'Ireland, N.,' and 36 in 'Scotland, N.'"

VARIORUM.

HARTON CEMETERY, SOUTH SHIELDS.—The pretty little cemetery of Harton, South Shields, has now assumed its summer garb; it is very beautiful in appearance, and the flowers scent the air with a pleasant fragrance. The spring decorations have all vanished except the Queen Stocks. At the entrance-gate they are planted in an irregular outline of three rows, the centre being white, and contrasting admirably with the other two, which are rose-coloured; the whole lending a charming appearance to the entrance to this neat and well-kept burial-ground. The carpet-bedding is completed with new and choice designs, and there is an abundance of hardy plants which have been acclimatised for that particular purpose. The alpine and herbaceous plants are now a very extensive collection, and of these there are many choice varieties in full bloom amongst the rocks near the churches, all these plants being correctly labelled for the instruction of visitors. The rare Edelweiss is just coming into bloom. Another interesting plant in bloom is the *Erinus alpinus*, to which reference is made by Dr. Bruce in his well-known *Guide to the Roman Wall*. A plant of this species was received by the superintendent of the cemetery, Mr. Bernard Cowan, F.R.H.S., from the Chesters, and Dr. Bruce thought the seed must have lain there from the time of the Romans [?]. It is now in full bloom, and may be seen on the northern border near the superintendent's residence, *Newcastle Daily Chronicle*, July 8, 1898.

MARKETS.

COVENT GARDEN, JULY 21.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

ENQUIRY.

"He that questioneth much shall learn much"—BACON.

EXHIBITING THE TREE LUPIN.—A question was raised at an exhibition, writes "W. G.," as to whether the Tree Lupin (*Lupinus arboreus*) is admissible in a collection of hardy herbaceous plants. In the North of Scotland (where the objection to it occurred), the plant, it is said, dies down annually as completely as a true herbaceous plant, while in the south and warmer parts it is truly shrubby. Perhaps some reader can in time a similar objection, and state how the matter was decided.

BOUVDIA: T. S. The mysterious Bouvardia disease, concerning which little is known.

CARNATION PLANTS ALL FLOWER-STEMS AND NO "GRASS." *Subscriber.* If you remove the stems of those seedlings that are worth preserving, the plants would throw up shoots; and should these be large enough in early September for layering in the usual manner, you might get them rooted, otherwise they must take their chance—and should they survive the winter, as they doubtless will, there will be a chance of early layering next year. Of course, you might lift the root-masses in October, and pot them, keeping them through the winter, and strike cuttings in bottom heat.

CATERPILLAR: E. L. The larva of some Hawk moth.

CHRYSANTHEMUM: J. Smith. We believe that the leaves are affected with a slime-fungus (*Pseudocommis*). Burn all the affected plants.

CYANIDE OF POTASSIUM AND MEALY-BUG: Alex. P. Haig. Very deadly to all animal life, but does not, when used according to the directions given in our leader, cause injury to plants, flowers, or fruit. The Grapes would be fit for use soon after the use of the cyanide, but exercise extreme care.

GRAPES: E. J., E. J. II., and F. J. Your Grapes are affected with spot, caused by a fungus, *Gloeosporium laticolor*, often mentioned in these columns. Destroy every affected berry. That is all you can do this year.

LAVENDER CULTURE FOR COMMERCIAL PURPOSES: W. Easter. Several articles descriptive of the culture of this plant have appeared in the *Gardeners' Chronicle*, but the numbers are out of print. Consult *The Art of Perfumery*, by Mr. Piesse, published by Longmans & Co.; and for formulas of manufacture of Lavender-water, *Odorographia*, by J. Ch. Sawer, published by Gurney & Jackson, 1, Paternoster Row, London, E.C.

NAMES OF FRUITS: *Persica laevis*. Nectarine Old Newington, if the tree have large flowers, and no glands on the leaves.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—J. C. & Co. *Phacelia congesta*, Hook.—T. Barre. *Oenothera biennis*, the Evening Primrose.—A. Murdon, *Mowbray*. *Cotoneaster affinis*.—W. T. T. *Lonicera Ledebouri*.—J. W. *Hippocrepis comosa*.—S. M. *Genista tinctoria*.—*Subscriber*. *Asparagus Sprengeri*, *Tamarix germanica* (not a Thuya), a first-rate seaside shrub.—E. W. 1, *Maxillaria tenuifolia*; 2, *Cirrha viridi-purpurea*; the latter not common.—Anstie. 1, *Galea officinalis alba* (Goat's Rue); 2, *Agrostemma coronaria*; 3, *A. c. alba*; 4, *Lychnis chalcidonica*; 5, *Agathaea caelestis*; 6, *Begonia vivicaus*.—J. H. 1, *Ononis arvensis*; 2, *Genista tinctoria*; 3, *Origanum vulgare*; 4, *Hypericum perforatum*; 5, *Centaurea scabiosa*; 6, *Astragalus glycyphyllos*.—P. de L. *Stanhopea Martiana*.—H. K. G. 1, *Epilobium montanum*; 2, *Centranthus ruber*; 3, *Aegopodium podagraria*; 4, *Asperula odorata*; 5, *Vicia minor*; 6, *Mercurialis perennis*.—A. S. *Bristol*. *Berberis Wallichiana*.—A. C. *Echium vulgare*.—A. C. K. Never pack flowers in cotton-wool. 1, *Stanhopea Wardi*; 2, *Streptosolen Jamesoni*; 3, *Humea elegans*.—A. C. F. Send when in flower.—J. W., *Kirkstall*. *Kniphofia foliosa*; *Hochstätter*, *Bot. Mag.*, t. 6742.

ROSE BLOOMS WITH GREEN CENTRES: H. H. The central mass of petals and organs have turned into leaves; which demonstrates the close connection between these two apparently very dissimilar parts of a plant. The causes are not known, as it has been known to occur alike on starved and well cultivated plants.

SPINELESS GOOSEBERRY, &c.: E. Carrol. See *Gardeners' Chronicle* for July 27, 1895, pp. 100 and 101, for figures and description. It was exhibited by MM. Letellier of Caen, at the meeting of the Royal Horticultural Society, on July 23 of that year. Some of the large growers of fruit trees may keep it, but it is said not always to retain its spineless character. In answer to your second question about shelter from north-west sea breezes, we think that you could not do better than to plant the evergreen Oak, *Quercus ilex*, in double and triple lines, some 18 to 20 feet apart, and fill in between them as nurse plants, to come out as the Oaks approach them closely, *Pinus austriaca* and *P. maritima*; and as undergrowth *Tamarix germanica*, *Portugal Laurel*, common Broom, *Berberis* (*Mahonia*) *aquifolia*, *B. dulcis*, *B. Darwini*, and single and double-flowered Gorse.

WATER FOR USE IN PLANT-HOUSES, &c.: E. S. You should obtain an analysis of the water from an analytical chemist. You would then know what is deleterious, and in what it is lacking.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED,
and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, JULY 30, 1898.

"MY GARDEN."

THE expression "My garden" seems to imply that every garden is not alike, either in its general characteristics or in matters of detail. It is a mere truism, doubtless, to assert that many gardens are widely opposite to each other in interest, effect, and constitution.

My garden (providing I have an interest in it and love for it) is, to some extent, a reflection of my ideas, tastes, and character, and it must be so, it must differ from the gardens of most other people. The principles that underlie a man's conception of that part of a garden which is not concerned with the production of fruits and vegetables, are usually the principles that guide him in all his recreations, and that possibly are not dissociated even from his business life. Unless the garden has some commercial interest to its owner, we may conclude that it not only contributes to his happiness, but is designed for that purpose, and is maintained for the sake of the pleasure derived from it. Pleasure, in this case, we intend to be taken in its broadest sense; it may mean the passing of leisure hours in a listless, idle fashion amid sylvan glades and gay flowers, or it may mean the enjoyment of every moment that can be snatched from a short life, in enthusiastic admiration of fine effects in the flower, fruit, and vegetable garden. It may be much more than this even, and consist in the satisfying of a desire for knowledge, for intimate acquaintance with the constituents of the garden; its living inhabitants, whether plants, birds, fishes or insects. If it be the latter case, then just as much as in the two former cases does the garden contribute to the pleasure of its owner. Therefore, if the owner have sufficient interest in his garden to induce him to guide its formation and maintenance, it will follow that the garden so formed will deviate from the average type, in the direction its owner knows will enable it most to contribute to his pleasure.

This much may be said because we are apt to become narrow in our ideas of a garden, and what it should be. Unless it conform to a certain type, some persons will condemn it. Instead of doing this, however, it would be better to try and look at it in sympathy with its owner; try to see it through his eyes, and inasmuch as it is seen that it is well preserved, carefully maintained, and moreover is calculated to give him greater pleasure than any other form of garden would be capable of, one's toleration should be sufficient to enable us to admire something in it ourselves.

I had recently the pleasure to visit Mr. Smee's gardens, at The Grange, Hackbridge, and whilst thoroughly enjoying the many beautiful features it disclosed, I could not but

think that many estimable gardeners would have very little sympathy indeed with many of them.

One sometimes thinks that such and such a plant should be in every collection; this or that feature is thought to be equally indispensable to every garden. What scanty interest, however, there would be in visiting numbers of gardens if each was after the same pattern, if each had been designed by persons holding similar views as to what like a garden should be.

There is the enthusiastic plant-lover, who looks upon his garden as merely a place in which he can keep his treasures to their advantage and his own, but who possibly neglects the general effects entirely, and even has not the orthodox reverence for orderliness and neatness. It is a pleasure to visit such a garden, because if you are fortunate to do so in company with its owner, you are certain to be shown a great variety of rare and interesting species, and your guide will know all about them and their habits, whilst his enthusiasm for his plants will be apt to prove contagious.

Another garden may be totally different, for, we will suppose it has been formed for the purpose of providing scenic effects. The flower garden and the pleasure-grounds at every turn afford a different but charming view, and one cannot visit them without experiencing intense pleasure; for the eye is delighted by harmonious colour effects, or by equally ravishing landscape pictures. But possibly its owner is less careful of his plants as plants, than the owner of the garden described above. Then there is the specialist's garden, and there is much to be said for this. In one the specialty may be fruit, in another Roses, in a third Carnations, in a fourth Orchids, in a fifth Bamboos, or possibly Conifers, in a sixth Chrysanthemums or other florist's flower. It seems to us that a real lover of horticulture cannot visit either one of these without interest and pleasure, and it is usually the endeavours made in the "specialist's" garden that result in the general improvement of strains of plants, to the better embellishment of gardens of an opposite character.

We cannot understand a garden-lover who himself preferring to treat his garden in a natural, informal style, has a contempt for florist's flowers, any more than the dislike entertained by others to gardens which do not make a *spécialité* of their particular plant or style of arrangement.

These remarks, suggested by recent visits to Mr. Smee's garden and to some others of diametrically opposite character, are intended as a plea for more catholicity of taste amongst horticulturists, on the ground that every endeavour to practice the art of gardening, and every sacrifice on its behalf is entitled to our sympathy and appreciation. We did not intend to write a long or complete description of Mr. Smee's garden.

Most of the readers of the *Gardeners' Chronicle* have, I hope, read *My Garden*, an excellent book, written by the late Mr. Smee, in which he very fully described The Grange gardens, their style of treatment, the most interesting features and plants therein, and the natural history of the place; the birds, insects, and fishes found in the neighbourhood, and the geological conditions of Wallington. Each was given ample explanation. Mr. A. H. Smee, who had also a considerable share in the writing of the book, has maintained the gardens in much the same lines as did his father, and few, very few, alterations have been or are likely to be made. To those who may not have read *My*

Garden, it may be said that The Grange gardens are an illustration of the free hand, the most natural style of treatment. Informality, irregularity, and a disposition to make a cultivated garden as nearly an imitation of nature as possible, may be seen in almost every corner.

The residence itself is partially hidden by garden-Roses, *Wistaria sinensis*, *Eucalyptus globulus*, Clematises, &c.; and looking from the front windows over the lawn are seen a few beds of sub-tropical plants, and herbaceous perennials and Lilies; whilst a little further along, the Meadow Sweet, apparently in a wild condition in company with the common Nettle, is visible by the side of a streamlet. No "bedding-out" is there in front of The Grange, and if we wander to the lake the water for which is obtained from the river Wandle, the aquatic plants that hide its margins seem as fully at home as if wild. You would, indeed, look in vain for a ribbon-border, but in the quest you would be sure to encounter a quiet corner and a tempting summer-house; and if beguiled to enter, and listen to the warbling of the birds around, or enjoy the peeps of the garden obtainable from your seat, you would be difficult to please if you did not experience a delightful moment.

THE ORCHIDS OUT-OF-DOORS.

I doubt not it was Mr. Smee's love of treating everything as naturally as possible that first led him to cultivate the cooler species of Orchids during summer in the open air. The experiment proved successful, and the visitor to-day would find the *Odontoglossums* and the hardier *Oncidiums* standing upon a raft on the water under trees that thoroughly shade the plants, but where no other protection exists. Not only are the least valuable of these species so cultivated, but the choicer varieties of *Odontoglossum crispum*; *Oncidium macranthum*, and *O. Marshallianum*. The *Masdevallias*, too, are usually placed outside, but this season they have needed attention in the way of repotting, and are still indoors. There is an exceeding choice collection of *Cattleyas*, rich in valuable varieties. These are growing in a span-roofed house that has a metal roof and large panes of glass. The large amount of light and air they receive induce the plants to bloom exceptionally freely, but the leaves and pseudo-bulbs are less green in colour from the same reason. The glass-houses, from the gardener's standpoint are not remarkable; several of them are inconveniently small, and not the best adapted to the purposes they are put.

Fruit trees generally suffer, from the fact that there is water in many places at about 18 inches from the surface of the ground. When the roots enter this, the fruits sometimes split and cease to be satisfactory. This fact is an unpleasant one for Mr. Humphrey, who has succeeded Mr. G. W. Cummins in the management of Mr. Smee's garden.

I confess to an admiration of a certain amount of formality in the garden; the orderly management and appropriate merging together of the different sections, a free use of the beautiful strains of florists' flowers, and evidences throughout of skilful cultivation that helps every plant to attain to the maximum beauty of which it is capable, whether it be a *Malmaison* Carnation or a *Chrysanthemum*; but the smartest, best-kept garden I remember to have seen, nor the finest *Malmaison* Carnations, or exhibition Roses it is possible to produce do not prevent my appreciation of such delightful features as exist in the establishment the late Mr. Smee fondly described as "My Garden." R. H. P.

VEITCH'S PROLIFIC STRAWBERRY.

NOTWITHSTANDING there are numerous new Strawberries raised yearly, any variety that promises to become valuable invariably attracts the interest of gardeners, for the reason that the Strawberry crop whether forced or out-of-doors, is an important one in the economy of the fruit-garden. Veitch's Prolific, capially illustrated at fig. 20, was awarded a First-class Certificate at the meeting of the Royal Horticultural Society held on July 12. It resulted

it at its best last year at Wilhelmshöhe near Cassel, as I mentioned in my notes some time ago, and believe this is partly due to the somewhat higher altitude of the gardens there, and the cooler and fresher climate.

Begonia Bavaria originated in the nursery of Mr. W. Gerbel, Rorschach, Switzerland, in 1879, out of a batch of 600 to 800 seedlings raised by G. Klay, head gardener, from crossings between various Begonias, among which were B. Dregei, and Weltoniensis; its exact parentage is, however, not known. Exhibited for the first time in Rorschach in 1884, it attracted the attention of the Duchess of Hamilton, and of

three sides with hills and vineyards, the climate is very hot and sultry at times during the summer, and I have always found Begonia Bavaria to be at its best after a spell of cooler rainy weather—rain hardly having any effect on the flowers—or towards the autumn when the cool evenings set in to somewhat balance the heat of the day.

It flowers continually and late into the autumn, until it has to be removed for fear of frost. Producing hardly any female flowers, it cannot be raised from seed, and propagation by means of cuttings (or division of older tubers) is the only practical way of getting up stock.

FIG. 20.—VEITCH'S PROLIFIC STRAWBERRY.

from a cross between Empress of India and British Queen. It is of British Queen shape, but bright crimson in colour, and it ripens to the tip. The form is either cockscomb or conical; it is a most productive variety.

FOREIGN CORRESPONDENCE.

BEGONIA BAVARIA.

I do not know whether this Begonia has ever been noticed in these columns before; still, being such a beautiful variety, and, in my opinion, suited to the English climate, it may not be amiss to once again draw attention to it here. It has been cultivated several years in Stuttgart, and has always been very showy, especially towards the autumn. I saw

Herr Gartendirektor Dreher of Krauchenvics, and was finally taken up by the late Mr. Franz Buchner, of Munich, who distributed it in commerce as Begonia Bavaria.

Begonia Bavaria is a tuberous-rooted dwarf variety, 5 to 6 inches high, and has small, almost heart-shaped, dark green leaves. The flowers also are small, $\frac{3}{4}$ to 1 inch in diameter, and of a most beautiful delicate pink, slightly flushed with violet. It is very floriferous, producing, almost without exception, only male flowers, which stand quite regularly just above the foliage. In it we have a most useful variety for groups and bedding purposes. It stands a sunny as well as a shady position, although, as I have already mentioned, it seems to delight in cooler temperatures and situations than we, as a rule, can give it here.

Stuttgart, lying in a valley, and being enclosed on

This, however, requires some care. Cuttings may be made in May and June from tubers which have been started early into vegetation, or in August. The latter is the course we favour here, owing to pressure of business in spring. We generally try to secure cuttings which already have a few roots, and prick these out into carefully prepared frames, where they remain until finally taken up in autumn on the approach of cold.

The main thing, especially at first, to attend to is great cleanliness, and as much pure air as is possible for cuttings, for if closed up in a sultry impure air they will very soon damp off, which is very infectious when once started among cuttings of this plant. Another point to attend to is, when drying them off for the winter, not to cut the stems too near the tuber, or they will fail to start into growth the following spring. H. R. W., Stuttgart.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY, 1898.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

* * Fuller comments will be given in the following numbers. See also Leading Article on page 86.

APPOINTMENTS FOR AUGUST.

MONDAY,	AUG. 1	Bank Holiday. Northamptonshire Horticultural Society's Show, at Northampton (2 days). Beddington, Carshalton, and Wellingdon Horticultural Society's Show, in Beddington Park.
TUESDAY,	AUG. 2	Scottish Horticultural Society Meeting.
WEDNESDAY,	AUG. 3	York Florists' Exhibition of Carnations.
FRIDAY,	AUG. 5	Midland Carnation Society's Show (2 days).
TUESDAY,	AUG. 9	Royal Horticultural Society's Committee.
WEDNESDAY,	AUG. 10	Bishop's Stortford Horticultural Society's Show, at The Grange. Wiltshire Horticultural Society's Show, at Salisbury. Hastings and St. Leonard's Horticultural Society's Show.
THURSDAY,	AUG. 11	Taunton Deane Horticultural Society's Show.
FRIDAY,	AUG. 12	Alderley Edge and Wilmslow Horticultural Society's Show, at Alderley Edge (2 days).
SATURDAY,	AUG. 13	Royal Botanic Society, General Meeting.
WEDNESDAY,	AUG. 17	Shropshire Horticultural Society's Show, at Shrewsbury (2 days). Dover Horticultural Show (2 days). Shanklin (Isle of Wight) Horticultural Show.
THURSDAY,	AUG. 18	Royal Jersey Horticultural Society's Show. Niton (Isle of Wight) Horticultural Show. Ponteferct Castle Horticultural Show.
FRIDAY,	AUG. 19	Devon and Exeter Horticultural Society's Show. National Co-operative Flower Show, at the Crystal Palace (2 days).
TUESDAY,	AUG. 23	Royal Horticultural Society's Committee. Brighton and Sussex Horticultural Society's Show (2 days).
WEDNESDAY,	AUG. 24	Harpenden Horticultural Society's Show.
THURSDAY,	AUG. 25	Ayrshire Horticultural and Agricultural Society's Show, at Ayr. Swansea Horticultural Show. Ellesmere Floral and Horticultural Society's Exhibition.
FRIDAY,	AUG. 26	Royal Horticultural Society of Ireland, Exhibition.
SATURDAY,	AUG. 27	Worsley Horticultural Society's Show.
MONDAY,	AUG. 29	National Chrysanthemum Society's General Meeting.

SALE FOR THE ENSUING WEEK.

FRIDAY,	AUG. 5	Imported and Established Orchids, at Protheroe & Morris' Rooms.
---------	--------	---

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63° 2'.

ACTUAL TEMPERATURES:—

LONDON.—July 27 (6 P.M.): Max., 76°; Min., 60°.

PROVINCES.—July 27 (6 P.M.): Max., 70°; York; Min., 52°; Sunburgh Head.

Dull, close; thunder showers locally.

OUR correspondents in all parts of the kingdom have, with their usual kindness, provided us with the means of judging the amount and the quality of the fruit crop (see pp. 79 *et seq.*). Taking it for all in all, the fruit-year may be taken as below average.

Apples in Scotland are above average; in England they are much under the mark; in Ireland they are nearly up to the standard.

Pears in Scotland, as might be expected, are much below average, but still more so in England, where they are very bad. In Ireland they are not much better.

Plums are under average, and very much so in England and Ireland.

Cherries have done better; they are above average in Scotland, much above it in England, and up to the average in Ireland.

Peaches, Nectarines, and Apricots, are hardly of sufficient consequence to be noted here.

Small fruits, on the contrary, including Currants and Gooseberries, are up to average in Scotland, over average in England and Ireland.

Strawberries have been over average in Scotland, England, and Ireland. In most localities they have been abundant, in few have they been scanty.

Nuts, including Walnuts and Filberts, have been about average.

To make the records complete, the weather at the flowering period, the elevation, aspect, soil, and other local conditions, should be given, but time and space do not permit of these details being given. Anyone with a taste for statistics, and plenty of leisure, would do good service by collating the tables we have given since 1867, with the weather records, and, as far as possible, with the local conditions. Such a task is beyond the possibilities of a weekly journal.

Bamboos.

THE principal feature at the show at the Drill Hall on Tuesday last was undoubtedly the magnificent group of Bamboos and allied plants shown by Mr. FREEMAN-MITFORD, C.B. Messrs. VEITCH's group, like that of Mr. T. S. WARE, was smaller, but some of the specimens showed excellent cultivation, while Messrs. GAUNTLETT's group showed how well these plants do in Cornwall. We have already figured several specimens, and we hope to be able to figure several more, as no doubt Bamboos will be grown much more extensively in the future. Their perfect hardiness, and in many cases their extreme gracefulness, make it certain that when the public get to know them, they will adopt them largely. Most of them are hardy in all parts of the kingdom, and Mr. FREEMAN-MITFORD has given us a useful means of recognising the hardy ones by means of the smaller transverse veins. Those that have these veins are hardy; those destitute of them are uncertain or tender. Mr. MILNE REDHEAD tells us that in N.E. Yorkshire *Arundinaria japonica*, *Quilicoides*, *mitis*, and *Simoni* are quite hardy.

The afternoon lecture was given by Mr. FREEMAN-MITFORD, and was devoted to the consideration of the economic uses of the Bamboo, which scarcely falls short of those of the Cocoa-nut. "How can I exist for a single day without this gentleman?" say the Chinese, according to Mr. MITFORD. "How can I exist for a single day without this gentleman?" will be the cry of the gardener who is privileged to see the Bamboo garden at Kew, that at Batsford Park, at Shrubland, and many other places.

HYBRID PERPETUAL ROSE "MILTON."—Our Supplementary Illustration exhibits a variety of H.P. which was shown as a cut bloom by Messrs. W. PAUL & SON, of Waltham Cross, at the Royal Horticultural Society's meeting held on Tuesday, July 12, in the Drill Hall, Westminster. The flower is above the average size, of a purplish-red tint, and as seen on that occasion, it appeared to be rather rough. Mr. PAUL has faith in his production, and predicts a popularity for it.

HORTICULTURAL CLUB.—The annual excursion of the members and their friends took place under the most favourable circumstances on Tuesday, the 19th inst., and its success was mainly owing to the exertions and kindness of Mr. HARRY J. VEITCH. A large party assembled at the Great Western Station at Paddington at 10 o'clock. They were thence conveyed in a saloon carriage to Slough, where breaks awaited them. Thence they were first driven to Stoke Pogis, in the churchyard of which village the poet

GRAY lies buried, and where he wrote his *Elegy*. The church is prettily situated in Stoke Park, and the members, through the kindness of Mrs. BRYANT, had an opportunity of viewing the mansion and its contents. They afterwards drove to East Burnham Park, the residence of Mr. HARRY J. VEITCH, who had kindly invited the party to luncheon. Sir J. T. D. LLEWELYN, Bart., M.P., the Chairman of the Club, thanked Mr. VEITCH for his hospitality, and expressed his regret at the unavoidable absence of their secretary. The party then drove to Dropmore, where a sight of the grand Conifers was much enjoyed. The return was made through Burnham Beeches, where some time was spent in viewing some of the finest trees; and then, after a stroll through the grounds occupied by these fine old trees, comprising about 400 acres, the party returned to Mr. VEITCH's, where tea was kindly provided for them all, and they left for town at 6.45. It should be added that, not only did Mr. VEITCH receive them "right royally," as one of their members expressed it, but he took upon himself the whole arrangements, and so well, that not a single hitch occurred, and one of the most pleasant and enjoyable outings the Club has ever had will be long remembered by those who had the pleasure of sharing in it.

POSTPONEMENT.—We are desired to state that the West of England Chrysanthemum Society's Show will be held at Plymouth on November 3 and 4, instead of November 1 and 2, as previously announced.

NATIONAL CHRYSANTHEMUM SOCIETY'S OUTING.—The members and friends of this society have for years past adopted the practice of having an annual outing in the month of July, and the one for the present year took place on the 25th inst., a large party going by a morning train to Harwich from Liverpool Street, where they were met by a contingent of members and friends from Ipswich, Colchester, &c., and about 170 persons partook of an excellent dinner at the Great Eastern Hotel, Mr. T. W. SANDERS, the chairman of the committee, presiding, supported by some of the officers and members of the committee. A few complimentary toasts having been drunk, the company went aboard one of the fine saloon steamships of the Great Eastern Railway Company, and having rounded the Bell Buoy, went up the river Orwell to Ipswich, where a landing was made for an hour, some of the company proceeding to view the town; and a considerable number were conducted over the extensive works of Mr. WILLIAM COLCHESTER, by whom they were hospitably entertained. Soon after five the steamer returned to Harwich, the fine wooded landscapes on either side being seen at their best and greatly admired. After partaking of tea at the hotel, the town of Harwich was visited, and the return journey made soon after eight o'clock. The weather was delightful, and all expressed themselves highly pleased with the day's outing.

RESEARCH STATION FOR HAMBURG.—It is, we learn, the intention of the State of Hamburg to establish a station for the investigation of insects and contagious funguses inimical to plant life. The director of the establishment is Dr. C. BRICK, of the Botanical Museum, Hamburg; and the zoologist, Dr. L. REH. The chief reason for the establishment of the station was the continual examination at the port of Hamburg of imported fruit from the United States of America suspected of infestation by the San José scale. The station will further watch the importations of living plants from abroad, in reference to *Phylloxera*, &c.; and other important objects of its mission will be the combating of all sorts of plant diseases, the inspection of the schools for viticulture, of Vines grown on trellises, &c., and fruit orchards in Hamburg and the surrounding country, and generally to occupy itself with matters pertaining to the above subjects.

YORKSHIRE NATURALISTS' UNION.—The 140th meeting will be a three days' excursion, held at Easington, for Spurn and Kilnsea, from Saturday to Bank Holiday Monday, July 30 to August 1, 1898. Week-end headquarters at Easington. Accommodation

FIG. 21.—HYBRID PERPETUAL ROSE "MILTON": DEEP CRIMSON. (SEE P. 86.)

being very limited, early application for rooms should be made to Mr. Sheppard, who will keep a list of rooms available at Easington and Kilnsea, and allot them to members according to priority of application. If all are taken up, late applicants can find accommodation at Withernsea. Programme of Monday's meetings: 3.30 P.M., conveyances leave Kilnsea Warren for Easington; 4.0 P.M., meat tea, 2s. each, at the Neptune Inn, Easington; 4.45 P.M., sectional meetings, and 5.0 P.M. general meeting, in the open air if weather is fine; the chair at the general meeting will be occupied by the president of the Conchological Section (Mr. F. W. FIERKE); 5.20 P.M., conveyances leave Easington for Withernsea; 6.35 P.M., train leaves Withernsea for Hull; 8.40 P.M., train leaves Hull for the West.

SPITALFIELDS MARKET.—After a considerable waste of time in "looking round" the subject, the London County Council has determined to apply to Parliament for the necessary powers to enable them to acquire the existing $2\frac{3}{4}$ acres of market-space and buildings in Spitalfields—compulsorily, if necessary. The place is too often in a congested condition, almost beyond the disentangling powers of London policemen.

THE HOLIDAYS.—Those lucky ones who are contemplating how and where to pass their holiday, may peruse with great interest and advantage the taking little pamphlet issued by the G.E.R. Co., entitled, *Royal Mail Route to Holland*. As the artistic coloured plates show, Holland is by no means the only place within easy reach of the Harwich route, but Belgium, Switzerland, Holland, Denmark, and Scandinavia can be visited; and the fares are very low, considering the accommodation given.

STATE HORTICULTURAL EDUCATION.—Sir Trevor Lawrence when presenting, on the 20th inst., the prizes, &c., gained by the students during the past year at the Horticultural College, Swanley, lamented that we were still without any assistance from the State in the direction of systematic horticultural education. Individual effort alone has to do, said Sir Trevor, what in Belgium, Holland, France, and Germany is undertaken by the State. We wonder if we shall ever have this question of technical education satisfactorily settled?

THE CACTUS SOCIETY.—If anything can justify the multiplication of "special" horticultural Societies, perhaps it may be, that they become influential and successful. If the National Cactus Society is to justify its existence on such grounds, it must wake up. At its exhibition on Tuesday last, there were not more than twenty plants staged, and there were but four exhibitors.

BRIGHTON AND SUSSEX HORTICULTURAL SOCIETY.—The members of the Brighton and Sussex Horticultural Society listened to an address which was delivered to them on Thursday night, July 21, by Mr. H. ELLIOTT, of Lancing, on "The Nature and Development of Buds." Mr. ELLIOTT is a ready and fluent speaker, with many graphic and striking phrases at command. His lecture went into the life-history of a bud, explaining its formation, and the chemical actions that took place in that formation, and showing the part played by the bud in relation to the growth and well-being of the tree. He demonstrated the similarity of the bud, the seed, and the bulb, and pointed out the value of having such scientific knowledge of the economics of Nature that the gardener would more intelligently appreciate the principles on which he carried out his various details of culture, and be more certain of attaining the highest development. He particularly applied his observations to the processes of grafting and pruning. He impressed upon his hearers, that whatever was found in the embryo would come out in the fruit.

BURFORD, DORKING.

It is doubtless due to the fact that Sir Trevor Lawrence consistently follows his own proved methods of culture that we are able to say to-day that his

gardens generally, and especially the extensive and almost priceless collection of Orchids, which embraces more rare species than any collection ever got together, are in finer condition than ever. Many times during his long experience in Orchid culture has Sir Trevor Lawrence heard of a royal road to successful Orchid culture having been discovered by someone who has derived favourable results from this or that new potting material, or of some stimulating chemical; but the voice of the charmer has never been listened to, and consequently his collection of Orchids is one of the best in the world, whilst the royal roads to success have turned out either blind lanes or short cuts to the rubbish-heap. In his efforts to secure the finest degree of health in his plants, he has always been well seconded by Mr. W. H. White, his careful and energetic cultivator.

That which strikes the visitor especially is the perfect order and cleanliness prevailing in all departments in and out-of-doors; and this is more apparent in the floors, staging, pots, and everything else in the houses. This leads to another notable feature, viz., the pureness of the air of the houses, whether warm-house or cool ones. Again, throughout the whole place it is not possible to find a water-logged or over-watered plant, or one unduly dried, the needs of every plant being well and suitably attended to, the result being that the Orchids have a profusion of roots. Another striking thing in the Burford collection is the beauty of the foliage of the plants, and the absence of injury or disease. But in gaining all this experience, some failures, of course, have occurred; and even of them Sir Trevor Lawrence speaks pleasantly, and sums up with the remark, "If I only had the plants we have lost, in addition to those we now have, how delighted I should be, but many of them money cannot replace." At one time the *Odontoglossums*, though keeping healthy, did not increase much in size, and it was reported that at Burford, as at Downside, near by, *Odontoglossums* could not be grown. But they were taken in hand, and especially during the last three years have made such progress that they are now second to none, and in appreciation of their good behaviour a very fine new house has been built, which is now filled chiefly with fresh imported *Odontoglossum crispum*.

Passing through the Orchid-houses and noting some of the more beautiful species and varieties in flower, we found among the remarkable collection of *Cirrhopetalums* and *Bulbophyllums* a very singular little Brazilian species, and the curious inflated-flowered *B. elegans* in bloom, and in bud the rare and showy *B. longisepalum*, *B. grandiflorum*, and others. In this warm house the fine collection of *Phalænopsis*, and the equally fine lot of *Catasetums*, both of which genera have in times past given trouble, are in grand condition, and in proof that the house is suitable for *Phalænopsis*, is the evidence of seedling *Phalænopsis* coming up in a noble specimen of *Vanda Sanderiana*, which brought the seeds on its roots. Here, too, in flower are *Cypripedium* × *Lebaudyannum*, *C. × Eleanor*, *C. Stonei*, and other species; and in splendid health the rare *C. Stonei platyanum*. In this house the lesser *Angræcums* thrive, and many are sending up spikes, among them being one of the original importation of *A. Kotschyi*, a species which has almost disappeared from cultivation. At one end of the house a plant of *Vanda Lowi* was sending up a good spike; and in bloom were *Dendrobium Dearei*, *D. crystallinum maximum*, and other warm-house species.

Of the rarer species in bloom or bud in the *Aërides*-house were the pretty carmine-crimson *Saccolabium Hendersonianum*, a good example of *S. guttatum*, and the white and blue *S. coeleste*; tall spikes of *Phaius Humbloti* appearing in the centre stage, and on one side a tub of the Madagascar Lattice-plant, *Aponogeton (Ouvirandra) fenestralis*, with its singular large skeleton leaves.

In the lobby we remarked *Vanilla planifolia* covered with pods, and an interesting collection of *Polystachyas*, those in flower being the rose-lipped *P. Lawrenceana*, a very pretty species from the Nyassa district, and *P. odorata*. This season seems

to be favourable to growth in *Dendrobiums*, and the Burford plants are making vigorous growth. This is especially the case with the hybrids raised at Burford, and which promise to be even much finer than usual.

In the intermediate-houses are handsome varieties of *Sobralia*, viz., *S. virginalis*, a fine white, with yellow base to the lip; *S. violacea alba*, white, with yellow tinge on the lip, and a very pretty broad light purple band; and a fine dark form of *S. macrantha*, were noted. In the house with these plants were the following in bloom:—*Epidendrum arachnoglossum*, *E. × O'Brienianum*, *E. fragrans*, *E. Wallisii*, *E. variegatum*, and other species; *Epiphrontis* × *Veitchi*, the curious *Lycaste Dyeriana*, with a growth somewhat like that of *Cattleya citrina*, and singular-looking greenish flowers; the gold and purple *Eriopsis rutidobulbon*, the scarlet *Habenaria rhodocheila*; *Stanhopea Devoniana*, the remarkable *S. Rodigasiana*, *S. tigrina*, *Oncidium O'Brienianum*, *Platyclinis glumacea*, a plant with about 100 spikes; *Miltonia vexillaria superba*, the original plant named in 1882; the pretty scarlet *Hexisia bidentata*, *Lælia majalis*, &c.

In the cool-houses, the plants were remarked in grand condition, and some of the *Odontoglossums* in flower or bud. Among them was a pretty plant of the floriferous *O. aspidorhinum*; also a very handsome species with flowers resembling *O. ramosissimum*, but with different bulbs; *Oncidium dasytyle* and its showier hybrid, *O. præstans*; and a number of the pretty *O. spilopterum* in spike. Among Burford hybrids, the showiest are *Cypripedium* × *Lawrebel*, *C. × concolawre*, and the handsome *C. × Olenus* Burford variety, the finest of its section. A plant, a singular cross between *Cattleya elongata* (Alexandra) and *C. Schilleriana*, the expanding of whose flowers is looked forward to with great interest, was in bud.

The Masdevallia-house had the usual collection of interesting and rare species of dwarf-growing *Masdevallias*, *Restrepias*, *Pleurothallis*, &c., some of them in bloom; and on the staging among the fresh green foliage appear flowers of some of the showier species. The *Cattleyas* and *Lælias* have but few flowers at this season, but the plants, and especially the large masses of *C. Bowringiana*, were in fine health; so also the large specimen of *C. Lawrenceana* of the original importation.

In the little seedling-house many interesting crosses were approaching maturity; in the warm lean-to, the *Vanda* × *Miss Joaquim*, which has been so greatly admired when shown from Burford, and which is being propagated by division, and also the plants of its two parents, *V. teres* and *V. Hookeriana*, were thriving admirably, and the specimen of *Eulophiella Peetersiana*, recently illustrated in the *Gardeners' Chronicle*, safe over the great effort of flowering, and again growing well in company with another plant of it in the large stove, which is bright with the spathes of large plants of the showiest *Anthuriums*.

The gardens and pleasure-grounds, sheltered by the almost perpendicular face of Box Hill, whose chalky surface is partially clad with Box, Beech, *Viburnum*, and other trees, are beautiful in the extreme. At the entrance the tall straight trunks of the trees, with their carpeting at the base of Ivy, and yellow-flowered *St. John's Wort*, is a cool and beautiful spot. Beyond stretches the smooth turf, with its glowing beds of flowers, most of them the newest or best of their kinds. Here were observed a pretty clump of *Cannas* in bloom, there a showy bed of *Begonia Martiana*, edged with the dwarf red *B. Bavaria*; then an elegant arrangement of green and variegated *Eulalias*, and at every turn fresh and pretty combinations, none of them commonplace. In the centre of the parterre is a fountain and basin, in which *Nymphæa Robinsoniana*, *N. Marlacea* and its varieties of various shades of rose-colour, and the pale yellow-coloured *N. chromatella*, the delicate blush-white *N. alba rosea*, were flowering. The lobes or bays at the edge of the basin were aglow with the flowers of *Begonias*, and the whole was beautiful in effect.

In the quarters where novelties of home and foreign origin are tested, were noted a number of *Iris lævigata*

(Kämpferi). These plants did not succeed at Burford till a certain kind of bog-earth which Sir Trevor Lawrence thought might suit them, was brought in, and since that was done, they have grown well. Another plant noted was the hybrid *Azalea* × *Rhododendron*; and in the bed in which it grew was *Myosotidium nobile*, also growing well. Other showy beds were *Platycodon Mariesii* and *P. M. alba*, *Phloxes*, *Pentstemons*, and *Carnations*. The handsome *Rubus leucodermis* with its whitened stems, was remarked at the edge of the dell, some patches of *Gentians*, a grand array of the hardy *Crinum Mooreanum* and *C. × Powellii*, and varieties of *Penzance Sweet Briars*, clothing the fence dividing the herbaceous ground from the other part.

The fruit-houses contain capital crops, and the greenhouses were bright with tuberous *Begonias*, the dark blue flowers of *Exacum macranthum*; *Streptocarpus*, &c., mingled with the various graceful species of *Asparagus*, and the warmer houses with species of *Anthurium*, &c. Two fine examples of *Solanum Wendlandianum* were noticed, which had been out of doors all the winter, and one is well set with flowers; also a great bush of *Swainsonia galegifolia alba*. The sheltered spaces between the glass-houses are used for acclimatising rare plants, and for bringing on new water-Lilies in tubs of water, preparatory to placing them in the ornamental basin. Mr. Wm. Bain, the gardener at Burford, keeps the whole of the gardens worthy of the noted Orchid collection; and the

FIG. 22.—JAPANESE ARRANGEMENT OF FLOWERS.

chief reason why gardening generally is so satisfactory at Burford is, that Lady Lawrence and the rest of the family are all true lovers of plants and flowers.

JAPANESE ARRANGEMENT OF FLOWERS.

THE Japanese are justly famous for their skilful arrangement of flowers, by which the poorest of blooms are made to look their best, by being so displayed that their full beauty can be appreciated. Most of these good effects are produced by placing the flowers very sparsely in Bamboo-tubes, no attempt at a crowded bouquet being ever made. Some of the Bamboos are familiar to us by this time, but, strange to say, they have been more widely adopted by milliners for the display of their artificial blooms than by those who are clever at the disposal of the natural blossoms. Perhaps one reason for this is, that after a time, the tubes are apt to leak, and their owners have not enterprise enough to get a small glass or zinc-lining made to slip inside them to hold the water.

The latest importation from Japan for the purposes of floral decoration consists merely of a long strip of lead, which is crinkled and crumpled up into as many folds and flutings as possible (see fig. 22). These crumples must be so managed as not to interfere at all with the firm base, which enables the lead to stand steadily at the bottom of a bowl or basin. The flutings form a series of miniature tubes, into which the stems of the flowers are pushed, and which can be easily pinched or enlarged, as the slimmness or thickness of the stems require. The flowers should on no account be crowded; and, of course, the higher

they stand up above the edge of the bowl, the more graceful will they look. Not infrequently the lead is placed in the centre of a large bowl, the water in which is allowed to be seen all round the flowers, and is supposed to give a cool look to the decoration. A miniature pond may readily be produced in this way, with small Sedges, grasses, *Butomus*, or *Herb Trinity*. The leaden ribbons vary somewhat in size; some are silvered, others are left in the natural colour of the metal. Those who are skilled in the art of arranging flowers should feel an interest in trying experiments, and gaining fresh effects, by the help of this very simple contrivance, which we first saw in use in one of Messrs. Wallace's exhibitions at the Drill Hall.

BELGIUM.

ANTWERP HORTICULTURAL EXHIBITION.

AT the last Exhibition of the Antwerp Royal Horticultural Society, under the presidency of Baron Ed. Ory de Lewaart, Governor of the Province, the cut Roses shown were specially fine, notably the fifty varieties from M. Henri Vanderlinden, which were cut with long stems and foliage, and grouped with pot-Ferns.

In certain sections the entries were but few, but the classes for groups of plants proved very popular. Among the best groups were those arranged by Madame Ernest Osterrieth and by M. Guillaume de Bosschere. The former collection occupied over 100 square feet, and included various blooming and not blooming plants, among them twenty fine *Streptocarpus Wendlandi*.

In M. de Bosschere's group, thirty Orchids were placed by a mirror with charming effect. Other floral decorations, especially a beautiful white basket of *Odontoglossum crispum* and *O. citrosum*, and other white blossoms, were tastefully arranged. The two exhibitors obtained Diplomas for Artistic Merit. The same distinction was awarded to M. Hessels for his fine groups of flowers, and to M. Blocky for the decoration of the winter-garden of the Royal Zoological Society.

Among the features of this exhibition were the fine *Iris anglica* and *I. Kämpferi*; the Orchids from M. Jules Hye, M. Ch. Vuylsteke, and M. Janssens, were also greatly admired, especially *Cypripedium callosum Sanderæ*, from M. Hye, which obtained a Certificate of Merit with the congratulations of the jury. I would also mention the fine decorative plants from MM. de Smet Frères, *Ch. de B.*

FLORISTS' FLOWERS.

CALCEOLARIAS.

ABOUT this date a sowing of seed for the main batch may be made. The seed-pans should be clean, and well drained, with a thin layer of moss, or any other suitable material, over the crotch, to afford egress to the water. In filling the pans, use a mixture of loam, peat, and leaf-mould, in about equal proportions, and fill the pots to within half an inch of the rim, press firmly, and make smooth; then stand the pans aside, and afford them a good dose of water with a fine-rose can, and in about two hours sow the seed thinly and evenly, but do not cover it with soil—merely sprinkle a pinch of silver-sand over it. Stand in a cool, shady spot, and cover with sheets of glass, a cold frame or hand-glass being placed over all.

If on examination the soil appears to be dry, apply water with the finest rose-can. When the plants appear, tilt the sheets of glass, and in a few days remove them entirely. At this stage, if water be needed by the soil, the pans must be dipped in a bucket of water, overhead-watering causing damping-off. When the plants have got two pairs of leaves, transplant them very tenderly to prepared seed-pans, about 1 inch from plant to plant, sprinkle some dry sand on the surface, and afford a gentle application of water through a very fine rose, and put the

pans into the same frame. The next shift will be into small pots, using then a slightly heavier soil. See that greenfly does not molest the plants, and with that intent afford slight fumigations. The chief points in the cultivation of the plant at this season, are the maintenance of a cool medium, freedom from direct sunshine, dampness with air afforded in sufficient quantity to induce a sturdy growth, and cleanliness. The best place for them is a frame facing north, with a coal-ash floor, which should often be sprinkled with water. Slugs must be diligently looked for. The best-sized pot for wintering the plants in, is a deepish 48. *H. Markham, Northdown, Margate.*

A STRAWBERRY-RASPBERRY.

ALL students of botany have been, perhaps are made to distinguish between the Strawberry with its dry pips or achenes bedded in a fleshy receptacle, and the Raspberry, with its small drupes (stone-fruits) on a dry receptacle. Both, it is hardly necessary to say, are members of the Rose family. But to show how variable plants are, and how cautious those who write or speak about plants should be, we figure a Strawberry, discovered by Mr. Worthington Smith, which, instead of the dry achenes (erroneously considered seeds) of the Strawberry, has the fleshy drupes

FIG. 23.—A STRAWBERRY-RASPBERRY.

of the Raspberry or Blackberry. We have never seen this before, and it is one of the most curious examples we have met with.

ROSE ENCHANTRESS.

(FIG. 24, p. 89.)

THIS introduction of Messrs. W. Paul & Son, Waltham Cross, is a new Tea-scented variety catalogued by them in the present year. It has flowers of creamy-white slightly tinted with buff in the centre, large, full, and globular; the plant is of vigorous growth with fine foliage. The catalogue tells us that "it is splendid for pot-culture, and late autumn and winter flowering;" and that plants have borne "three full crops of blooms in the space of twelve months." The plant has been exhibited at the Drill Hall during the present year. Having said thus much in its favour, we must ask our readers to test the good qualities of the variety in their own gardens, for the Rose has idiosyncrasies not a few. A good illustration of a bloom of this Rose was given in *Gardeners' Chronicle*, Dec. 7, 1895, p. 673.

HOME CORRESPONDENCE.

CROCUS NUDIFLORUS IN ENGLAND.—I should be much obliged if some of the readers of the *Gardeners' Chronicle* would throw some light upon the occurrence and cultivation of the autumn Crocus (*C. nudiflorus*) in this country. I wish to ascertain if it has ever been in any degree a popular garden plant, and if so, when, and whether there is any reference to its cultivation before the year 1738. I am afraid there is an initial difficulty, owing to the confusion of it with either *Colchicum autumnale* or *Crocus sativus* (by botanists, at any rate) until about the beginning of this century. The object of this enquiry has

reference to the occurrence of this Crocus as a native or naturalised plant in England. It is well established in many stations in eight contiguous Midland counties, but is not reported to grow wild in any other part of the country. This, bearing in mind the peculiar endemic character of the genus, points rather to its being native here; but I must admit that an acquaintance with about ten places where it grows within a few miles of Halifax, does not lead me to strongly support that view. On the other hand, I cannot believe that it is merely a garden escape. Though the nature of the stations where it is found does not preclude its being a native, it points rather to its being a plant which was once cultivated as a substitute for the Saffron Crocus. Against this view there is the fact that none of the farmers (on whose land it is growing) or villagers make any

Halifax; near Derby (J. Whittaker); Rochdale (Mrs. Atkins); Warrington, and meadows near Nottingham—but its being really indigenous is very doubtful, as it occurs nowhere in northern France, and the continental area of the species is distant from the English habitats by fully 6° of latitude." . . . "Crocus nudiflorus is one of the earliest of the autumnal species. The new growths commence in July, immediately after the maturity of the corm and the dying away of the preceding vernal leaves, each producing a solitary flower whilst the leaves are yet dormant. The flowers are developed with remarkable rapidity early in September, and are fugacious, remaining in perfection only three or four days. Cultural directions are scarcely required for a plant having the vigour of *Crocus nudiflorus*. It is one of the largest and most ornamental species of the genus, and one which no

There is no doubt that a clear official statement would greatly assist the Institution, and increase the number of gardeners who would subscribe thereto. *Thos. Fletcher.*

CAMPANULA MEDIUM CALYCANTHEMA.—We observe with much pleasure an illustration of *Campanula Medium calycanthema*, on p. 65 of your issue of the 23rd inst. It may be of interest to your readers to be reminded of the fact that this beautiful form was fixed by our predecessors, Messrs. Waite, Burnell, Huggins & Co., and offered to the trade about the year 1872. We have it on record that some specimen plants were submitted to Dr. Masters, F.R.S., with a view of obtaining his opinion as to the value of the plant, and he not only highly commended it, but was kind enough to furnish us with the name which the plant now bears. The enclosed photo of the plant submitted to Dr. Masters will, no doubt, be of interest to you. We may also mention that this variety is now commonly known as the "Cup-and-Saucer" Canterbury Bell. *Cooper, Taber & Co., Ltd.*

THE ROUNCIVAL PEA.—For the information of readers of the note on p. 70, the name of this Pea is stated to have its origin from Roncevalles, a town in the north of Spain, in the Pyrenees, from whence they were first imported. On referring to one of the oldest Seed Catalogues in my possession, that of Stephen Switzer, published in 1731, compiled largely according to modern ideas, and entitled *A Catalogue of Seeds, Fruits, Shrubs and Flowers sold at the Flowerpot over against the Court of Common Pleas in Westminster Hall, and at his garden on Millbank, Westminster*, I find this enlightened seedsman affords the following particulars. After recommending certain varieties of Peas for sowing in October and November, and from Christmas to Candlemas, he says: "For a third sowing are the Marrowfats, Spanish Mullato, Dutch Admirals, and the blue Rouncival, or Union Pea or Nonsuch, which is a very large, fine kind of the Spanish Mullato, about the beginning or middle of March. It is best to stick them in the summer. A gentleman near Hammer-smith cuts the Marrowfats off, and some serve the Union so, after he has eat the first crop, and lets them spring again, they will, as he says, bear a second crop." This would seem to confirm the fact that this Pea was brought to our fields and gardens from the northern part of Spain. Stephen Switzer was a remarkable man for his time; between 1715 and 1745 he was the author of several of the most advanced works on gardening, and acknowledges his having industriously submitted "to the meanest labours of the scythe, spade, and wheelbarrow." He first of all appears to have been apprenticed in the service of the celebrated gardener, George London, superintendent of their Majesties' gardens, and director-general of most of the gardens and plantations of Great Britain, and page of the back-stairs to Queen Mary, afterwards a partner in the firm of London & Wise, at the great nursery at Brompton. Johnson, on p. 159 of his *History of Gardening*, observes of Switzer, "Neglect has pursued him beyond the grave, for his works are seldom mentioned or quoted." To me he appears the best author of his time, and if I was called upon to point out the classic author on gardening, Switzer would be one of the first on whom I should lay my finger. Pulteney, in his ingenious *History of the Progress of Botany* in this country, seems to have ignored him altogether. The introducers of most of the other varieties of Peas mentioned by your correspondent "R. D.," will be found in a series of articles on this vegetable, contributed by me to the *Gardeners' Chronicle* in the autumn and winter of 1894. *Donald McDonald.*

OROBANCHE SPECIOSA.—Your allusion to this plant reminds me of a field of Beans just outside Cairo, which, at a distance, looked like some nursery ground for gorgeously flowering herbaceous plants in masses, as there was more of the Broomrape to be seen than Beans. It consisted of tall spikes some 4 feet in height, densely covered with white, yellow, and lavender-coloured blossoms of different shades. It would make a splendid herbaceous border plant, of course associated with some Broad Bean plants for it to live upon. By dumb show I pointed out to an Arab the necessity of cutting them down, pointing to some dead Bean plants. He only shrugged his shoulders, smiled, and said, "Kismet," and then walked away. *George Henslow.*

A CURE FOR BLINDNESS IN THE STRAWBERRY.—Your readers this week will no doubt have re-

FIG. 24.—ROSE ENCHANTRESS, GROWING AS A STANDARD. (SEE P. 88.)

use of it, or have heard of any application of it for culinary or medicinal purposes. Still, there is no doubt that Saffron was once largely used, although it has fallen into comparative disuse. It would be interesting to know also, for the purpose of comparison, how far back the cultivation of *C. vernus* and *C. sativus* in England can be traced. *W. B. Crump*, 90, King Cross Street, Halifax. [The following extract from Mr. George Maw's excellent monograph will probably supply some of the required information:—"There are also several localities in the midland counties of England where *C. nudiflorus* may be mistaken for an indigenous plant—hilly pasture-field below Woolstanton Church, one mile from Newcastle, Staffordshire (Mrs. Edwards); Adlington, near Wigan (Mrs. J. Hoare); Norfolk (Mr. J. Hoare); near Shrewsbury, in the Quarry Walks, about the Dingle, in the grass field, and in the adjoining field to the west (T. H. Archer Hind); meadows near Manchester, very common; fields at Sairle Green, near

garden should be without. In a warm, open autumn, its clear purple flowers form a most attractive addition to the rockwork or herbaceous border; but as the flowers are liable to be broken down and injured by rain, their full beauty can best be preserved under the protection of a large bell-glass or cold frame. In such a situation they form a mass of rich purple, the brilliancy of which is enhanced by the contrast of the colour of the bright golden stamens and stigmata." *Ed.*]

THE GARDENING CHARITIES.—If Mr. Monro will refer to your issue of July 9, he will find that I offer £20 to the Royal Gardeners' Benevolent Institution on the condition that "every subscriber who is a gardener, shall be absolutely certain that at least the amount of his payments, plus 2½ per cent. compound-interest, shall be guaranteed, if applied for, either at the age of sixty-five or at death." The offer was not an unconditional one, as he appears to imagine.

marked the editorial note following the letter of Mr. H. Fisher, of Flixton Hall Gardens, Bungay, on p. 73, relating to the fruiting of the Strawberry called Monarch. Your remarks are very pertinent to this subject, and I wish with your permission to back up the subject by showing that I got over Vines from Turkey, and after I had had them some time I found that they did not show for fruit. One of my friends from Constantinople who grows Vines there, informed me that it would be necessary for me to obtain Vines in England of different varieties to put near to the Vines from Turkey, and that then they would fruit. His experience in Turkey was that the Vines required the aid of other varieties of Vines to cause them to yield large crops of Grapes. *Thos. Christy.*

— When it is suggested that what is termed "blindness" in Strawberry plants may possibly be corrected by planting some fertile variety close by to presumably furnish pollen, does not this advice arise from a misconception of what is in gardening parlance meant by "blindness"? But the misunderstanding is entirely due to the use of a term that is misleading. By blindness, in a floral sense, is meant absence of fertility, or imperfect fertilisation. The term in the ordinary sense, as used in relation to Strawberries, means entire absence of flowers, the plants showing none whatever. To what cause that form of blindness is due no one seems able to tell, as varieties habitually fertile occasionally fail to produce bloom. I have never yet heard of a case where Strawberry-flowers went blind because pollen was absent. *A. D.*

COBBETT'S CORN.—Although this selection of Maize is not much heard of now, yet some twenty years ago it was well known, and formed, so far as I am aware, the only product of a garden character to which the name of "Cobbett" was attached. The variety was dwarf and precocious. The stock having been carefully selected for English culture, and with ordinary care from open-air sowings, good ripened cobs were easily obtained in Middlesex. The late William Abbott, eldest son of the famous Cobbett, referred to by Mr. Roberts, and who was for some time my near neighbour at Bedford, Middlesex, informed me that the introduction was erroneously attributed to his father, as he was the real introducer of the variety here from America. Mr. Abbott had the corn grown largely by a local farmer for sale, and tried hard to push it into notice for agricultural purposes, but failed. I found it readily productive sown on mounds beneath which a few spits of manure were buried towards the end of April, ripening cobs in August and September, also furnishing plenty of green cobs for cooking. *A. D.*

CARBOLIC-SOAP AND GREEN-FLY.—What can I do to clean my Rose-bushes? Such is the question often asked, especially by amateurs and cottagers, with pathetic earnestness, when they find their Rosas infested with green-fly. The answer invariably given is: Syringe the bushes with some approved insecticide, which will effectually clear them of the pest. They find, however, very little comfort or encouragement from such a statement, because they say "There are so many cures recommended, and we don't know what strength to use them, and might kill the bushes as well as the fly; and moreover we have no syringe with which to apply them. We must therefore leave them alone, hoping that a heavy shower will soon come and wash a lot of them away." I do not know if carbolic-soap as an insecticide is a new discovery, but it so happened that a member of the household was using the soap, and seeing a quantity of fly on a Rose-shoot she bent it gently and dipped it in the liquid. In a short time after, the shoot was examined, and found to be clean and uninjured. I thereafter went over three beds of Teas, some of the shoots of which were badly infested, dipped the points in the liquid, and found them next morning perfectly clean, without a leaf being injured. I therefore recommend all those troubled with insects on their bushes to secure a small piece of this soap, wash face and hands in two quarts of soft water well with it, put the solution in a shallow dish, bend the shoots gently and immerse the points, bud and all, and the insects will disappear. The Rose-bed may therefore be cleared at a cost of less than one farthing. *W. W., Fifeshire.*

CARROTS.—Whilst Mr. Markham is lauding certain varieties of Carrots with which we have long been familiar, it is far from pleasant to find in so many directions how badly Carrots have done this season. No matter on what soil seen, and I have seen the produce of hundreds of sowings of late, and

nothing so rare as a good clean bed of Carrots. Parsnips, Onions, and Beets close by have been first-rate. The maggot has been credited with the trouble, but aphids seems to have been the primary cause, for these insects have attacked the foliage in an unusual way this year. No doubt, could liberal soakings of manure-water have been given, much good might have been done. The cold nights so much in evidence in the spring seem to have weakened the foliage, and robbed the plants of power to recover from the attack. *D.*

STRAWBERRY RICHARD GILBERT CARMICHAEL.—This promises to be one of the finest and most useful of all Mr. Carmichael's seedlings. A cross between Frogmore Late Pine and Waterloo, it was until this year considered a mid-season Strawberry; but this year it ripened abreast of Royal Sovereign on the same ground. On Saturday, July 16, I have just returned from a careful inspection of these and other Strawberries in Mr. Carmichael's garden, Inverleith Row, Edinburgh. As he intends showing some of the best of these at the show of the Royal Horticultural Society on July 26, it is not needful to advert to them further here than to add that they retain the qualities for fertility, quality, and stubby growth already given them. The two Cockscomb-fruits of Richard Gilbert, gathered at random this morning, each turn the scale at 1 oz. (one is 2½ inches across, the other 2¼ inches). The colour is dark, revealing a good dash of Waterloo blood, the flesh solid, the specific gravity the most dense and heavy of any Strawberry I have yet handled. The flavour is also excellent, and it has all the qualities of a good traveller. The Princess of Wales and Queen of Denmark are smothered with fruit, few or any of which will be ripe this month. From what I have recently seen of new Strawberries, it seems to take some of them two or three years to fall into their true fruiting season. Double-bearing sorts, as Louis Gauthier, and the new perpetual hybrids, such as St. Joseph, are likely to add several months to our pleasures of Strawberry-growing and eating. *D. T. Fish, July 18.*

MARKET GARDENING.

HARDY FRUITS.

(Continued from p. 25.)

THE APPLE.—In writing about this most important fruit, I propose to adopt the classification initiated by Mr. C. Whitehead, in *Fruit Growing in Kent*, adding to each section new and tried kinds, as well as novelties up to date. But I am writing for all England, not for a single county. Many sorts, highly and justly appreciated in their own district, are not fitted by Nature to thrive elsewhere. I shall not include many such local kinds.

Having had a long experience with the pomona of all the so-called Apple-growing counties, especially with the garden of England—Kent, the cider-producing counties, and also Normandy, I have quite given up all attempts to convince growers that there are better kinds than they insist on growing, and better methods of compassing the economical production of paying fruits; to quote Butler's jingle—

"Convince a man against his will,
He's of the same opinion still."

So, endeavouring to honestly say my say, "I leave it to be accepted by those who will, and ignored by those who will not." I have already said that the Apple is indigenous, and no doubt when our remote ancestors dyed themselves with woad, and made their "dress-coats" of the skins of animals taken in the chase, with the tails of the captured beasts hanging down behind (the archetype of the modern dress-coat), the boys of the period climbed the Crab-trees of our forests and woods and got the fruit, and, doubtless, the stomach-ache too. Oh, shade of Darwin! must not one acknowledge as great a difference between a monkey and a West-End exquisite as between a Crab and a Cox's Orange Pippin? No one doubts the origin of our Apples to be the Crab, the rough, sour fruit being found wild from Land's End to John o'Groat's. The methods of propagating the varieties of Apple have been given in former numbers of the *Gardeners' Chronicle*, I will only repeat here, that for standards the Crab-stock

is the best, and for dwarfs and pyramidal trees, the Paradise stock; the first giving a vigorous and free-growing tree, and the last a short-jointed bush or pyramid, heavily furnished, as a rule, with fruiting-spurs.

Proper cultivation is an item either ignored or overlooked in the majority of attempts to start fruit-growing as a paying commercial speculation. No graver mistake can be made. First, therefore, see that your soil is right; a moderately stiff loam, resting on rock, gravel, or sand, is the best, but it should in the latter cases be not less than 2 to 3 feet thick, and in every case it should be efficiently drained; while if it can be secured, a slope to the south or south-west is beneficial. Doubtless the best fruit is grown upon cultivated ground, but this need not obtain if proper care be taken to annually enrich the surface-soil, where it is laid down to grass, by good mulchings of partially-decayed farmyard-manure. Nevertheless, it is wrong to lay down the orchard or plantation to grass on first planting, but it may as a rule be safely done after a lapse of three or more years, when, if the directions as to pruning, &c., are followed, the fruit will continue to be good in quality, and the yield remunerative.

I am well aware that my own county, Kent, is favoured in many ways for the development of this important industry, namely in soil, climate, and contiguity to the all-absorbing markets of the metropolis. Railway facilities are now great, and most of the companies have begun to see that special rates and modified methods of conveyance will pay, so that other fruit-growing centres will be able to compete with Kent, Essex, and Surrey, to say nothing of Middlesex.

Nor must we forget one among the many good things promised the farmer—light railways; though I must confess, without prejudice, as the lawyers say, I should like to have seen a few more projected lines made, if only two per cent. of those talked about! *Experience.*

(To be continued.)

NURSERY NOTES.

MESSRS. J. VEITCH AND SONS.

THE season for the Carnation has been not too favourable, and flowering is later by a fortnight than the average. We found at this nursery the usual display in the accustomed square, between the blocks of glasshouses, and passing the eye over the beds from a short distance, the effect of the numerous open flowers gave the idea of an abundance of bloom; but a close inspection revealed the inimical effects of the burning heat and general aridity of the past week. The beholder can but wonder at the high average excellence of the flowers in, as it were, the heart of London. We regret to notice the gradual extinction of the Picotee as a flower for the ordinary cultivator; and it, indeed, seems that we shall have to look to the specialists and fanciers for these lovely forms, as we now have to do for the higher forms of the florist's Pinks—and yet, neither presents any difficulties in cultivation. Almost any deeply-worked, well-manured soil—not rich half-decayed, or fresh rank manure for these, please, but the same decayed and immediately available as food for the plants, plenty of road-grit or coarse sand (sea-sand, if it can be obtained), the Carnation and Pink delighting in salt in moderation, and a bed prepared and stirred about for a month before it is planted; and raised 2 or 3 inches above the surrounding level, as well as drained otherwise from below, will suit these plants. Given these requirements and an open position, anyone may grow the whole tribe with the least amount of after trouble. In town it is advisable to purchase the plants in pots in early spring, or propagate one's own from layers and cuttings, as the case calls for, and keep the same in pots in airy, cold pits or frames over the winter, letting them freeze without fear of loss.

It is the dreadful fogs, the ever abundant smuts and dirt that kill the plants in the winter in a London garden, and the glass frame wards off some of these.

If the plants are plunged to the rim of the pots in a bed of fine coal-ashes, scarcely any water will be needed by them from the end of the month of November to that of January.

Among novelties of excellence noticed, we may make mention of the following Carnations:—Edith Ladenham (1896), a good full flower, white, one of the best of its class, and growing to a height of 2½ feet; Horace Trelawney, one of Mr. Martin Smith's raising, of a fine shade of pink; Sweet Briar, a bright tint of scarlet, very fine when it opens, one of the best; G. McKay, an excellent white, possessing stout, rounded petals, and a calyx that does not split, a free, strong bloomer, and a good "doer;" Pandelli Ralli (Mr. M. Smith), a lemon-yellow bloom, with excellence in most points; Boadicea, raised by Mr. Smith, a scarlet flower, bold and good, with a dwarf style of growth; Edward Marshall, a brilliant scarlet flower of perfect form; Sir G. Faudel Phillips (Hopper), a deep crimson flower; Miss Alice Mills, a yellow ground fancy. Most of the old favourite varieties in Carnations, such as Bendigo, Cara Roma, Queen of the Yellows, Corunna, Crombie's Pink, Alice Ayres, Mephisto, Mrs. Watts, The Dey, Czar, Joe Willett, Rose Celestial, and Hayes Scarlet, were included in the collection, they being for massing and bedding considered indispensable.

Picotees.—Wanderer (Mr. M. Smith), a yellow ground flower; Badminton (Mr. M. Smith), another fine yellow-ground, that is likely to prove a good variety, and find many admirers; Empress Eugénie, Golden Eagle, very pretty, growing to a height of 2½ feet, and Mr. Nigel, are yellow-grounds, of considerable merit, and rich and pleasing markings. Norman Carr was the best rose-edged, and Amy Robsart, a fine purple-edged Picotee, were remarked.

Growing in pots under glass are numerous varieties, and among these some very beautiful flowers were observed; as, for example, Mrs. Colby Sharpin, a full flower, with round, smooth-edged petals, of a rosy-fawn tint; Mrs. Audrey Campbell, as yet considered to be the finest yellow self; Sadik, of a rich rose-pink (Mr. M. Smith); Seagull, of the palest flesh tint, almost identical with Her Grace, but possessing a slightly deeper tint. The collection in the open beds should be in good condition for ten days longer.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 26.—An ordinary fortnightly meeting of the Committee was held on Tuesday last in the Drill Hall, James Street, Westminster. There was a good muster of exhibits, the Hall being nicely filled. A considerable share of the space was taken up by several collections of Bamboos, including an extensive exhibit of these beautiful foliage plants, from Mr. FREEMAN-MITFORD, C.B., who showed several species not previously exhibited, and afterwards delivered an address upon the "Economic Uses of the Bamboo." Apart from the Bamboo there were many exhibits of hardy flowers, Sweet Peas, and annuals.

Groups of Ferns, Caladiums, the new Acalyphas of Messrs. SANDER, and other plants were also shown, and two Awards of Merit were made to new Roses from Messrs. W. PAUL & SON, Waltham Cross. Awards of Merit were also made to *Buddleia variabilis*, from Messrs. W. PAUL & SON; Ivy-leaved *Pelargonium* Achievement, from Mr. H. J. JONES; Carnation Isinglass from T. B. HAYWOOD, Esq.; and Carnation Lady Sophie, from Mr. F. JAPPER, Sundridge Park, Kent. First-class Certificates were recommended to two *Nymphæas* shown, from Gunnersbury House gardens; and several awards went to Bamboos above mentioned, from Mr. A. B. FREEMAN-MITFORD, C.B., and Messrs JAS. VEITCH & SONS. Orchids were very few, but there was a considerable show of fruit, including a large exhibit of Gooseberry bushes in pots, from Messrs. JAS. VEITCH & SONS, who were also recommended an Award of Merit for a new pale-coloured Raspberry, to be known as Golden Queen. Several new Strawberries were before the Fruit Committee, and to one of these from Gunton Park gardens, and named Lady Suffield, an Award of Merit was recommended.

Two First-class Certificates were obtained by Messrs T. RIVERS & SON for Early Rivers Cherry, and Early Transparent Gage Plum. A similar award was recommended to a Cabbage-Lettuce named Crystal Cabbage, from Messrs. WATKINS & SIMPSON, who had an Award of Merit for Turnip Improved Model. Various new Peas were exhibited from Chiswick, and awards were made to upwards of half-a-dozen varieties.

The exhibition of the Cactus Society that was to be held in connection with the Drill Hall meeting, was small.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. John Fraser, Owen Thomas, H. B. May, R. Dean, C. J. Salter, Jas. Walker, Chas. E. Shoa, D. B. Crane, Chas. Jeffries, Herbert J. Cutbush, J. W. Barr, H. J. Jones, E. T. Cook, John Jennings, Jas. Hudson, H. Selfe-Leonard, Geo. Gordon, and J. Fraser.

Messrs. H. CANNELL & Co., Swanley, Kent, made an unusual exhibit in a collection of well-grown Succulents in pots. These were arranged with considerable care, and in such a manner that the form and colour of one species contrasted with that of another in close association with it; very few of them were in flower, but the exhibit was attractive all the same (Silver Flora Medal).

T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr., Mr. C. J. Salter), exhibited a splendid crimson Carnation, named Isinglass. It is a seedling raised at Woodhatch from seed supplied by the National Carnation Society, and is decidedly the best of its kind we have seen. The flowers are large and heavy, petals extremely good and fairly numerous, but notwithstanding this the calyx shows no weakness, and beyond this the flowers are gratefully fragrant (Award of Merit).

A similar Award was made to a fine Carnation named Lady Sophie, shown by Mr. F. JAPPER, Sundridge Park, Kent.

From Messrs. W. PAUL & SONS, Waltham Cross, Herts, was a large exhibit of cut Roses, of varieties exceedingly pretty and useful; a good proportion of which we noticed were some of their own introductions. Two Awards of Merit were recommended to new varieties, viz., *Souvenir de Madame Levet*, a dwarf-growing Tea, with blooms reminding one of the colour of those of W. A. Richardson, but in the present variety the colour evenly pervades the whole flower, and may be described as rich apricot. The other new one was H. T. Charlotte Gillinot, a fine pure white, full-petalled Rose.

Messrs. W. PAUL & SON were also recommended an Award of Merit for *Buddleia variabilis*, a small but densely-flowered species of pale lilac colour (a Silver Flora Medal was awarded the group). A very fine exhibit of cut Roses was shown by C. J. GRAHAM, Esq., Leatherhead, including upwards of sixty excellent blooms (Bronze Banksian Medal).

Messrs. F. SANDER & Co., St. Albans, showed a group of fine plants of *Acalypha Sanderiana* and *A. Godeffiana*, both of which have been figured as well as described in these columns on several occasions.

Mr. J. Fitt, gr. to F. W. CAMPION, Esq., Colley Manor, Reigate, showed freely flowered sprays of *Crimson Rambler* Rose.

Mr. Jas. Hudson, gr. to LEOPOLD DE ROTHSHILD, Esq., Gunnersbury House, Acton, showed blooms of species and varieties of *Nymphæa*; and First-class Certificates were awarded in two cases, viz., to *N. odorata rosacea*, a very pretty pink flower, and distinctly fragrant; and *N. gloriosa*, one of the very best of the red or crimson-coloured *Nymphæas*; *N. tuberosa*, a large white flower; and *N. sanguinea*, a very dark-coloured bloom, were also shown.

Messrs. HURST & SON, Hounsditch, showed *Tropæolum Lobbianum*, a variety with Ivy-shaped foliage.

Mr. AMOS PERRY, Hardy Plant Farm, Winchmore Hill, London, N., showed a few choice hardy flowers, such as *Helenium grandicephalum*, *H. pumilum magnificum*, a very fine variety of the species; *Inula ensiflora*, &c.

A group of one hundred species and varieties of the *Pteris* group of Ferns was exhibited by Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton. These plants were very beautiful specimens, and went to show the bewildering variety of forms obtainable from a single genus of Ferns, from the handsome palmate leaves of *P. ludens*, to the infinitely divided forms of *P. serrulata*. The exhibit was deservedly awarded a Silver-gilt Flora Medal. Mr. MAY also staged *Bouvardias* in flower of the varieties *Queen of Roses* (rosy-pink colour), *Jasminoides*, having white flowers with extra long tube, and some others.

Messrs. W. CUTBUSH & SON, Highgate Nurseries, London, N., made a fine display with hardy herbaceous and other flowers, the centre of the group being composed of plants and cut blooms of *Malmalson* varieties of the Carnation. Blooms of perpetual-flowering and border Carnations in sprays were pretty also (Silver Banksian Medal).

Mr. THOS. S. WARE, Hale Farm Nurseries, Tottenham, had a group of hardy flowers, the centre of which consisted of sprays of beautiful Lilies, *L. nepalense*, *L. dalmaticum*, *L. philadelphicum*, *L. Humboldtii*, *L. pardalinum*, several distinctly marked forms of *L. auratum*, and a plant of *L. giganteum* (Silver Banksian Medal).

A fine group of hardy flowers was from Mr. M. PRITCHARD, Christchurch Nurseries, Havant, in which we noticed the white-flowered *Oenothera speciosa*, the blooms of which are pure white excepting the yellow base; the showy *Helianthus rigidus præcox*, *Coreopsis lanceolata*, and others; *Lathyrus latifolius* in white, rose, and various coloured varieties, the brilliantly coloured *L. chalcidonicum*, the variety of *Chrysanthemum maximum* known as G. H. Sage, and other interesting species including herbaceous *Phloxes* (Bronze Banksian Medal).

Messrs. BARK & SONS, King Street, Covent Garden, London, W.C., had a magnificent bank of hardy flowers, in which some choice varieties of herbaceous *Phlox* were noticeable, *Hyacinthus candicans*, *Gaillardias*, *Lychnis chalcidonica*, and *L. c. fl.-pl.*, *Monarda didyma*, the handsome *Bocconia cordata*, and some excellent varieties of *Iris* were remarked among others (Silver Banksian Medal).

Messrs. CARTER & Co., High Holborn, London, made an exhibit of a large number of varieties of Sweet Peas, and the varieties being arranged to colour, the similarity between

many was obvious, whilst the dissimilarity existing betwixt others was equally well portrayed. The system of showing close bunches in very dwarf bulb-glasses, however, is not of the best taste.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, had a fine show of Lilies. Among these were noticed *L. Humboldtii magnificum*, varieties of *L. Thunbergianum* and *L. umbellatum*; also *L. auratum*, *L. Henryi*, *L. Browni*, *L. speciosum*, in white and coloured varieties; and the spotted *L. pardalinum*, and the dark *L. dalmaticum*. The very beautiful and richly-coloured *Hemerocallis aurantiaca* major was well shown. Messrs. WALLACE had also bunches of Border Carnations, some magnificent forms of *Iris Kämpferi*, a few species of *Brodieas*, and several varieties of *Calochorti* (Silver Flora Medal).

Messrs. DOBBIE & Co., Rothesay, N.B., had an extensive exhibit of Sweet Peas in bunches, *Violas* in sprays, and several hardy flowers, as *Lychnis chalcidonica*, *Chrysanthemum maximum*, *Anthemis tinctoria*, *Achillea Ptarmica*, "The Pearl," *Gaillardia grandiflora maxima*, and *Achillea Eupatorium*. All of these were staged well, and were commendable (Silver Flora Medal).

A group of well-grown *Caladiums*, shown by Mr. Tomlinson, gr. to R. HOFFMAN, Esq., West Dulwich, was awarded a Silver Flora Medal.

Messrs. A. W. YOUNG & Co., Stevenage Nurseries, Herts, showed hardy flowers in much variety, including a nice lot of Sweet Williams.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, again made a very pretty display of cut annuals, in which many varieties of *Lavatera*, *Coreopsis*, Sweet Peas, *Eschscholtzia*, *Stachys coccinea*, and other species were prominent. A nice collection of blooms of border, fancy, and other Carnations was shown also, and spikes several feet long of the yellow-flowered *Althea Primrose Queen*, a cross between a *Hollyhock* and *Althea ficifolia*.

Mr. H. ECKFORD, Wem, Salop, showed some new and very beautiful varieties of Sweet Peas—Duke of Westminster, purple; Robin Hood, reddish-purple; Mrs. Fitzgerald, Sadie Burpee, pure white; Othello, a very dark-coloured flower; Lady M. Ormsby-Gore, pretty cream colour; coccinea, one of the brightest-coloured Peas we have seen; and Hon. F. Bouverie, pink, were some of the best.

An Award of Merit was recommended to *Pelargonium Achievement*, shown by Mr. H. J. JONES, Ryecliff Nursery, Lewisham. It is a valuable Ivy-leaved variety, with partial character of the zonal.

BAMBOOS.

As befitted the occasion, two good representative collections of Bamboos, *Arundinarias*, and *Phyllostachys*, were shown, viz., by A. B. FREEMAN-MITFORD, C.B., Batsford Park, Moreton-in-the-Marsh, by Messrs. J. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, and a small one by Mr. GAUNTLETT, of Redruth, and M. T. WARE, Tottenham. The first was the greatest in point of numbers, and as might be expected in the matter of cleanness of leaf and stem. Coombe Wood, where the other collection hailed from being within the radius of London fog. We noted in Mr. FREEMAN-MITFORD's collection *Arundinaria racemosa*, a plant 6 feet high, said to have been not before shown; *A. Hindsii*, as well as the var. *graminea*, *A. aristata* (Award of Merit), with light green leaves and brown and brownish-green stems; *A. Fortunei*; *A. macrosperma*, a pretty, broad-leaved species; *A. Laydekeri*; *A. anceps*; *A. Falconeri*, a graceful, small-leaved species, hardy at Batsford; *A. falcata*, not reputed hardy there; *A. nobilis*; *A. palmata*; *A. pygmaea*; *A. Veitchii*; *A. metallica* (Awards of Merit), a seedling from *A. Laydekeri*, raised from home-grown seed; *A. chrysantha*, and *A. nitida*, to which a First-class Certificate was awarded. Of *Phyllostachys* there were *Castillinis*, with variegated leaves; *P. violascens*, a very graceful species; *P. fulva*, new from Japan (*A. M.*) *P. Quiloi*, a fine example; *P. heterocycla*, *P. aurea*, *P. Boryana*, and *P. Henonis*. The Bamboos consisted of *B. tessellata*, *B. Nagashima*, a species with rather broad leaves of a deep tint of green; and *B. disticha*. The Society's Gold Medal was awarded for the collection.

Messrs. J. VEITCH & SONS exhibited a relatively large collection of Bamboos in small and large well-grown examples. We noted the handsome black-stemmed *Arundinaria nitida*, *A. Simoni* var. *striata*, the varietal name being due to the white median stripe apparent in the younger leaves; *A. Veitchii*, a dwarf species, with broad leaves; *A. Hindsii* var. *graminea*, with narrow grass-like leaves, and slight green stems; *A. japonica* (Metake), tall, robust, with leaves 1 to 1½ inch wide and 8 inches long. The handsome yellow variegated *A. Fortunei aurea* (auricoma), of dwarf habit and a fine mass of *A. nitida*, which was awarded a First-class Certificate; it was 6 feet high, and as much in width; *A. Fortunei variegata*, with silvery lines on the green leaves; and *A. pumila*. Of *Bambusa*, there were *disticha*, a very distinct species, with very dark green foliage; *B. palmata*, and *B. Ragamowski*. The species of *Phyllostachys* included *nigra*, *Castillionis* (*A. M.*), *viridis glaucescens*, *henonis*, *Quiloi*, *nigro-punctata*, *aurea*, and *Kumasana* (*viminalis*), a very hardy, short-leaved, compact, dark green species. A Silver-gilt Flora Medal was awarded the collection.

Mr. V. N. GAUNTLETT, The Bamboo Nurseries, Redruth, Cornwall, showed *Phyllostachys aurea*, *Arundinaria Simoni*, in fine large canes, 15 feet long; *A. nobilis*, equally big; *A. Falconeri*, *Phyllostachys nigra*, and *Arundinaria Simoni striata*. These appeared to be stems with foliage cut from living plants. A Silver Banksian Medal was awarded.

Mr. T. WARE's small collection of Bamboos consisted of but a few species in well-cultivated examples. A Silver Banksian Medal was Awarded.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. Little, N. C. Cookson, J. Gabriel, H. J. Chapman, F. J. Thorne, W. H. Young, T. W. Bond, W. Cobb, F. Mason, H. M. Pollett, H. Ballantine, and Reginald Young.

In point of culture, the most remarkable exhibit was a noble plant of a very fine form of *Odontoglossum coronarium*, sent by W. G. GROVES, Esq., Holehird, Windermere, and for which he was awarded a Silver Flora Medal. The plant, which was on a teak raft 3 feet by 2 feet, had several strong leading growths; and bore two grand spikes, numbering over fifty flowers. The flowers were longer than usual in size, and of a shining brown hue, with some yellow freckling on the petals, and a bright yellow lip.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed a select group of fine hybrid Orchids, of which the most remarkable was the handsome *Laelio-Cattleya* × *Ingrami gigantea* (L. *pumila* ♀, *Dowiana* ♂), whose flowers far exceeded in size anything deemed probable in a *Laelia pumila* hybrid. The sepals and petals were of a bright rose tint, the petals measuring nearly 8 inches across. The showy labellum was maroon-purple, with orange lines at the base (First-class Certificate). Another fine thing in Messrs. Veitch's group was *Laelio-Cattleya* × *callistoglossa ignescens* (C. *Warscewiczii* *Sanderiana* × *Laelia purpurata*), perhaps the showiest of their many fine crosses; and remarkable were *Cattleya* × *Enid* (Mossie ♀, × *Warscewiczii* ♂), a light flower, well intermediate between the parents in character *Laelio-Cattleya* × *Amesiana* (L. *crispa* × C. *maxima*), one of the fine early crosses, with white flowers, having a rich rose-purple front to the lip; L.-C. × *Lucilia* (L.-C. × *Schilleriana* ♀, × C. *Dowiana* ♂), flowers white, with rose markings on the petals, and a very bright dark purple lip; L.-C. × *Zephyra*, with pale yellow flowers, and rose-coloured front to the lip; and *Masdevallia* × *Imogene* (Schlimi ♀, × *Veitchii* ♂), a pretty new hybrid, preserving the form and several-flowered spike of M. *Schlimi*, with the reddish colour imparted by the other parent (Award of Merit).

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed an inflorescence of *Laelio-Cattleya* × *Schilleriana*, Cambridge Lodge variety, which may be a secondary cross of L.-C. *Schilleriana* with L. *purpurata*. The sepals and petals were white, tinged with lilac; the lip, which differed from typical L.-C. *Schilleriana* in having the margin more circularly arranged, and exhibiting little separation of the middle and side lobes, was of a glowing crimson purple, the base, which is white, extending into two rounded lobes on the sides (Award of Merit).

Messrs. HUGH LOW & CO., Bush Hill Park, staged a small group, in which were two very clear white forms of *Cattleya Gaskelliana* alba, some fine forms of C. *Warscewiczii*, and C. *Mendeli*, a handsomely spotted *Odontoglossum crispum*, and a well-flowered *Vanda coerulescens*.

WALTER C. CLARK, Esq., Orleans House, Sefton Park, Liverpool, showed *Cypripedium* × Mrs. Walter Clark (Ashburtonie *expansum* × *Stonei*), an effective hybrid with the same general appearance as C. × *Morganiana*. Captain G. W. LAW-SCHOFIELD, New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Schill), showed a very richly coloured form of *Cattleya Warscewiczii*, in which the light patches usually seen on the lip were much reduced, and in the veining of the lip was a slight suggestion of C. × *Hardyana*.

Messrs. F. SANDER & CO., St. Albans, showed *Cypripedium* × *Orion* (*Selligerum majus* × *Rothschildianum*), with long arching petals of a cream-white, with chocolate-coloured blotches.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed *Cattleya Gaskelliana*, Crawshaw's variety, a very distinct form, with uniform light rose flowers, without the usual darker colour on the lip, the base of which was white and yellow. NORMAN C. COOKSON, Esq., Oakwood Wylam, Northumberland (gr., Mr. W. Murray), showed *Cattleya* × *Lord Rothschild* (*Gaskelliana* × *aurea*), a very pretty and delightfully fragrant flower.

Fruit Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. Geo. Bunyard, T. Francis Rivers, W. Poupert, A. F. Barron, T. Gleeson, T. J. Saltmarsh, Jas. H. Veitch, A. H. Pearson, Alex. Dean, C. Herrin, J. W. Bates, Geo. Wythes, J. Smith, F. Q. Lane, J. Willard, and W. H. Divers.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, showed fruits of eight varieties of Cherries, viz., Black Eagle, Baumann's May, Governor Wood, White Heart, Kentish, Early Red Gem, Bigarreau Napoleon, and Cleveland Bigarreau. Also a fine lot of fruits of the splendidly-flavoured, medium-sized Strawberry, Veitch's Perfection; also fruits of Frogmore Late Pine, Bilton Pine, Lord Suffield, Laxton's Latest of All, Waterloo, &c. Messrs. VEITCH were also recommended an Award of Merit for Raspberry Golden Queen, obtained from a cross between *Rubus laciniatus* and Raspberry Superlative. The fruits are pale in colour, agreeably acid, and apparently the plant has a free-bearing habit. An exhibit of Gooseberry bushes in pots from Messrs. JAS. VEITCH & SONS, comprised about fifty varieties, and illustrated the three systems of training known as "The Fan," the "Cup-shaped," and the Standard. We reproduced last year a bush trained in each of these methods, after a similar exhibit from Messrs. VEITCH to that of Tuesday last. The new varieties that were given Awards of Merit last season, viz., Langley Gage,

a good-sized yellow fruit, and Langley Beauty, a smaller fruit, and green in colour, were represented by fan-trained bushes. Both of these Gooseberries are fine dessert varieties, the latter being particularly so. Of the large number of other varieties, we can only give the best half-dozen of dessert and kitchen varieties respectively. Dessert: Early Green Hairy, Bright Venus, Whitesmith, Broom Girl, Golden Lion, and Red Champagne. Culinary: Surprise, Forester, Mitre, Tom Joiner, Trumpeter, and Clayton (Silver-gilt Knightian Medal).

Mr. OWEN THOMAS, Royal Gardens, Frogmore, showed eight large and handsome fruits of Melon Lord Edward Cavendish, a yellow-skinned, white-fleshed, juicy variety, that was given an Award of Merit in April last.

Mr. W. ALAN, gr. to Lord SUFFIELD, Gunton Park, Norwich, showed Strawberry Lady Suffield, said to be obtained from a cross between Lord Suffield and Empress of India, but distinct from both. A batch of yearling plants from a north border, and a box of fruits were shown, in comparison with fruits of the variety Lord Suffield. It ripens about a week before Lord Suffield, is a dark-coloured fruit, seeds very prominent upon the surface, Coxcomb in shape, of good flavour, and apparently a free bearer.

Excellent white Turnips of the Model type were shown from the Chiswick Gardens. The variety is known as New Model, and belongs to Messrs. WATKINS & SIMPSON (Award of Merit). A fine Lettuce to be known as Crystal Cabbage, also from Chiswick, and belonging to Messrs. Watkins & Simpson, was recommended a First-class Certificate. Of the culinary Peas that have been on trial at Chiswick, several varieties were sent up for ratification of Awards of Merit previously recommended by the committee at Chiswick. These were Bruce and Prior, from Mr. H. ECKFORD, Wem, Salop; Honeydew and Saccharine, from Mr. SIM; Sutton's Continuity, from Messrs. SUTTON & SONS, Reading; Hartford Success, from Messrs. NUTTING & SON, Southwark Street, London, S.E.; Manfield Show, from Messrs. WRIGHT & SON. A fine collection of about fifty dishes of culinary Peas from Messrs. W. W. JOHNSON & SONS, Ltd., Boston, Lincolnshire, was awarded a Silver Banksian Medal.

Messrs. T. RIVERS & SON, Sawbridgeworth, exhibited some excellent Cherries in variety, presumably from the orchard-house, and were recommended a First-class Certificate for the variety Early Rivers. A similar award was obtained by Early Transparent Gage Plum, from Sawbridgeworth. The fruits are medium-sized, and exceedingly pretty in appearance. A Silver Banksian Medal was awarded the collection of fruits.

A Cultural Commendation was deservedly awarded to Mr. W. H. DIVERS, gr. to the Duke of RUTLAND, Belvoir Castle, Grantham, who showed monstrously large, well-finished fruits of Strawberries Dr. Hogg, Gunton Park, and Waterloo. The fruits of Waterloo were especially remarkable.

Messrs. LAXTON BROS., Bedford, showed several new Strawberries, including one known as Filbasket, obtained from a cross between Royal Sovereign and Latest of All; it is a prodigious cropper, as evidenced by a few two-year-old plants exhibited. Trafalgar, also from Messrs. LAXTON, is a new, deep-coloured Strawberry of very large size, and it may prove tempting as a market fruit.

Strawberries were also shown by Mr. CARMICHAEL, 14, Pitt Street, Edinburgh. The varieties were Princess of Wales, Britannia, and Queen of Denmark. The fruits of each are small or medium-sized, but the flavour did not sufficiently impress the committee to grant any awards.

The Lecture.

THE ECONOMIC USES OF BAMBOOS.

No one knows more about Bamboos or their cultivation than Mr. A. B. FREEMAN-MITFORD, C.B., and it was a very interested audience that assembled at the Drill Hall after the meeting of the various committees to hear a lecture upon "The Economic Uses of Bamboos" from a person so well qualified to impart the information.

Mr. Freeman-Mitford was enthusiastic from his opening paragraph until the close of his paper. Speaking of the Burmese Bamboo (*Dendrocalamus giganteus*), reference was made to its splendid proportions. In Ceylon it grows as high as 135 feet, and its stems measure 27 inches in circumference. This is the greatest of the Bamboos, but its economic value is much inferior to that of many other species. It is quite hollow, and its stems are mere shells, whilst the fibre is spongy. It is of no use if permitted to dry, but as water-pipes the stems serve well, or as flower-pots. A splendid piece, which Mr. Freeman-Mitford exhibited to his audience, was from the Peradenya Botanic Gardens, and had been soaked in linseed-oil during its sea passage, to prevent it from splitting. We understood the lecturer to say that in Ceylon, where the Bamboos would grow in the most luxuriant manner, the only two species that had been planted were *Bambusa vulgaris*, and the Burmese species above remarked upon. Yet they had been planted for utility, and compared with the rest of the species were probably of the least value for general purposes.

The Cocoa-nut Palm (*Cocos nucifera*), was mentioned as being the only plant that could compete with the Bamboo for its general usefulness, and Europe as the only quarter of the globe where some species or other is not found. One species only appears at an elevation of 13,000 feet above sea level in the Eastern chain of the Ganges, and then but in irregular patches, whilst at 15,000 feet elevation, it forms the principal vegetation.

Reference was made to the habit of certain species having solid or hollow stems, according to whether they are grown in dry or moist districts. It could hardly be estimated,

said Mr. Freeman-Mitford, what the Bamboo is to the Chinaman. "It carried his mother a bride to the altar; it will carry him to the grave, and meanwhile will provide his house and almost furnish it." Mr. Freeman-Mitford, referring to the Tortoise Shell Bamboo, which has been described as *P. heterocycla*, said that the curious growth was a malformation only, the result of unsuitable soil and surroundings. In proof of this it was stated that *P. aurea* occasionally was so constructed, and a specimen was shown.

Alluding to the new species of *Arundinaria* exhibited on Tuesday, Mr. Freeman-Mitford said that *A. metallica* would be very valuable as an ornamental plant; it was more vigorous even than *A. Veitchii*. *A. aristata* would also prove a capital plant. *A. Veitchii*, *A. metallica*, and *Bambusa tessellata* were specially recommended for the planting of game-covers. The question was next discussed whether or not the cultivation of Bamboos for economic purposes was ever likely to become an industry in Britain. For many reasons, Mr. Freeman-Mitford declined to believe it will, but many of the colonies were finely adapted for their cultivation, and it needed that those whose business it was should see to it, that the species most useful economically, were selected for planting in such places. Coming to the prices paid for Bamboos imported into England, and the degree of remuneration there was to the growers who export them hither, Mr. Freeman-Mitford regretted that very little information was forthcoming.

Sir J. T. D. Llewellyn, Bart., who occupied the chair, advised the audience to visit the collection of Bamboos at the Royal Gardens, Kew, and observe how much they had improved, and how exceedingly graceful the species are. "Above all," said Sir J. T. D. Llewellyn, "experiment with Bamboos in your own gardens."

Mr. Harry Veitch said that his experience had shown him that Bamboos would flourish in almost any kind of soil, and in dry situations. Recently, when shrubs were almost dying from drought, the Bamboos remained healthy and in growth. If they were given a mulching in late autumn, the beneficial effect upon their growth the following year was most marked. He considered that the Bamboos were the very finest plants for creating good effects in the pleasure-grounds, that will ever be introduced into this country.

Dr. M. T. Masters, F.R.S., recommended that *Arundinaria japonica* be planted in London and other large towns. The species will succeed in Whitechapel or in Kensington.

The following Bamboos have been figured in the *Gardeners' Chronicle*:—*Arundinaria japonica*, p. 185, vol. ii., 1895; *A. nitida*, p. 179, vol. ii., 1895; *A. Simoni*, p. 181, vol. ii., 1895; *A. Veitchii*, p. 169, i., 1894; *Dendrocalamus giganteus* (Ceylon Giant), p. 275, vol. ii., 1881; *D. sikkimensis*, p. 793, vol. vii., 1890, and Dec. 3, 1892; *Bambusa heterocycla* (with oblique nodes), p. 559, May 5, 1894; *B. palmata*, p. 641, vol. vii., 1890; *B. quadrangularis tessellata*, p. 189, vol. ii., 1895; *Phyllostachys kumasakae*, p. 369, vol. ii., 1894; *P. nigra*, p. 185, vol. ii., 1895; *P. Quiloi*, p. 183, vol. ii., 1895; *P. viridi glaucescens*, p. 443, vol. i., 1899; and p. 183, vol. ii., 1895; and others.

EAST COWES.

JULY 20.—A meeting of the East Cowes Horticultural Improvement Society was held on the above date, Mr. G. GROVES, J.P., presiding. After a few introductory remarks, he called upon Mr. S. HEATON, Horticultural Instructor for the Isle of Wight County Council, to give the last of a series of gardening lectures, the subject being "Begonias: Tuberos, Rex, and Fibrous-rooted." The lecturer dealt at some length with the cultural requirements, and at the close questions were invited. The chairman, in moving a vote of thanks to Mr. Heaton, said that the lectures had been most interesting and instructive, and he hoped that at an early date they would be able to have another and a longer course of lectures from Mr. Heaton, who was master of his subject. The proposition was carried unanimously.

THE PEOPLE'S PALACE HORTICULTURAL.

JULY 21, 22, 23.—The summer exhibition of this Society was held on the above dates, and was the means of bringing together a display much in advance of anything seen before, which is one of the best testimonies to the importance of the work being done by the Society in the East End.

The People's Palace is well adapted for flower shows of this character, being both commodious and central, as well as being known; and spacious as the hall appears when unoccupied it is soon filled when a show is held, only bare space being left for locomotion. The district is divided into two sections: those living in the districts more favourable to plant-culture exhibit by themselves, and those in the more crowded districts by themselves. The wisdom of this arrangement is seen when the plants are brought to the Hall, the development of those from the more open parts being superior to those from the more congested neighbourhoods.

In the open section there were four entries for groups of plants covering a space of 36 feet, and two in the class covering half the space. In the case of the congested districts, there were four entries in the class for 18 feet, and in that for a collection of dwarf plants to fill a table space of 9 feet there were nine entries. As all the plants are grown in greenhouses mainly of home construction, it follows that there is a goodly number of these. Flowering plants were represented by Fuchsias, show and zonal Pelargoniums, Begonias,

Lilium var. *longiflorum* Harrisii, a Canna or two, Balsams, Petunias, Nicotiana affinis, &c. Of foliaged plants, Palms, Araucaria excelsa, Aspidistra, Coleus, Ficus elastica, &c., while some good Ferns were staged. Fuchsias, and also Begonias, shown in collections of four, were quite praiseworthy. Some remarkable window plants were staged, especially huge fan-trained Fuchsias. Hanging window plants were mainly the blue *Campanula fragilis*, or the white *Isophylla alba*. Some good bunches of garden flowers were staged, also of Sweet Williams, and there were also sprays of Violas and Pansies. Some charming table decorations, done with Iceland Poppies, were shown by Mrs. VINCE of Leyton. Even baskets of vegetables, grown in the East End, were shown, the best from a railway porter, who has a piece of garden by the side of a railway. There were plenty of plants from the members of the children's branch of the society.

Miscellaneous collections from supporters of the Society greatly helped the display. The President of the Society, the Duke of FIFE, sent a very fine group of plants, set up upon a large central stage. From Eaton Hall the Duke of WESTMINSTER sent a grand lot of cut blooms of Malmaison Carnations. A. E. HILLS, Esq., sent from Monk-hams a large ground group of plants; and the same came from LUDWIG MOND, Esq. Mrs. HOLMES, of the Frampton Park Nurseries, set up a fine group of plants. Messrs. W. PAUL & SON a large, varied, and very fine collection of Roses. Messrs. BARR & SON sent huge bunches of hardy cut flowers; the Duke of NORFOLK sent plants, and Mr. PRITCHARD, Forest Gate, an extremel interesting collection of Cacti.

SOUTHERN COUNTIES CARNATION.

JULY 21.—This Society was brought into existence in August last, through the exertions of Mr. William Garton, of Argyll House, Woolston, and it has for its president Sir J. S. Barrington Simeon, Bart., M.P.

Already the Society numbers some 200 members, and it may now be taken for granted that it has been started on a good foundation. An evidence of that was given in the first annual show, which was held in the grounds of Argyll House, Woolston (the residence of the hon. secretary and treasurer), on the above date. The exhibition, both as to dimensions and quality, far exceeded the most sanguine expectations, and Mr. Garton and those who have assisted him may be congratulated on the success of the first show. The season has been a bad one, the Carnations being late; there is also the show of the National Society on Wednesday next, which no doubt prevented several well-known growers from competing, but still, there was a capital exhibition.

LIST OF AWARDS.

Carnations, flakes, and bizzarres, twelve blooms (dissimilar), 1st, J. DOUGLAS, Great Bookham; 2nd, W. GARTON, jun., Woolston. Six blooms, 1st, F. HOOPER, Bath; 2nd, J. J. KEEN, Southampton.

White-ground Picotees (twelve blooms), 1st, J. DOUGLAS. Six blooms, 1st, S. A. WENT, Thames Ditton; 2nd, F. HOOPER.

Yellow-ground Picotees (twelve blooms), 1st, J. DOUGLAS; 2nd, C. TURNER, Slough. Six blooms, 1st, F. HOOPER; 2nd, C. PHILLIPS.

Yellow-ground and fancy Carnations (twelve), 1st, C. TURNER; 2nd, W. GARTON, Jun. Six, 1st, S. A. WENT; 2nd, A. J. ROWBERRY.

Selves (twelve), 1st, W. GARTON, Jun.; 2nd, C. TURNER. Six, 1st, S. A. WENT; 2nd, F. A. WELLESLEY.

Six Carnation blooms (mixed varieties of Picotees, fancies, and selves), open to those who had not before won a prize, 1st, E. H. BUCKLAND; 2nd, Mrs. WHITELEY, Downton.

Premier Carnations (bizarre or flame), J. DOUGLAS. Self, S. A. WENT. Fancy, C. TURNER.

Premier Picotees, white ground, J. DOUGLAS; yellow ground, J. DOUGLAS.

Twelve self or fancy blooms (nurserymen or amateurs), Silver Cup, 1st, J. DOUGLAS; 2nd, E. C. GOBLE.

Bouquet of Carnations or Picotees, 1st, B. LADHAMS; 2nd, E. C. GOBLE.

Spray of Carnations or Picotees, 1st, E. C. GOBLE; 2nd, A. J. ROWBERRY.

Vase of Carnations or Picotees, 1st, Miss E. WADMORE; 2nd, W. PALMER.

NATIONAL CARNATION AND PICOTEE.

JULY 27.—There is no pause in the progress of the Carnation in the estimation of the flower-loving public. Gardens in which the Carnation is plentifully grown over-flow with the spicy flower. It is essentially the July flower; no other can compare with it at this season of the year, when the fragrant Rose is fast losing much of the height of its summer beauty. Not only is the Carnation extensively grown, but the flower is largely utilised for a variety of decorative purposes.

The various uses to which the Carnation can be put, and the growing liking for the flower, have operated to strengthen the Society, and bring many new members to its ranks, and this despite the fact that societies for the promotion of Carnation-culture are springing up in different parts of the country.

The exhibition held at the Crystal Palace on the above date, though an extensive one, for the minor classes filled well, fell behind shows which have gone before, and

more especially in the quality of the bloom of the bizarre and flaked varieties. A few flowers were too old, many were too young, they had not opened kindly, while the cold nights not only had a retarding effect, but produced roughness and thinness, and purity of the ground colour was lacking. Growers from all parts were agreed that the season was one of the most trying for those desirous of exhibiting which had been experienced for years past, and this was observed in the fewer entries in some of the leading classes. But the flowers were seen to the best advantage arranged along the nave of the Palace of Glass, and the light was excellent.

CARNATIONS, BIZZARRES AND FLAKES.

There were three competitors with twenty-four blooms, not less than twelve varieties, Mr. M. ROWAN, Manor Street, Clapham, taking the 1st prize with some good flowers for the season, the purity of the ground colours being one of the chief features. He had of S.B.'s, Admiral Curzon, Robert Lord, and Robert Houlgrave; C.B.'s, J. S. Hedderly and Master Fred; P.P.B.'s, William Skirving and Sarah Payne; P.F., Gordon Lewis and George Melville; S.F., Constance Graham and Sportsman, as the leading blooms. Mr. J. DOUGLAS, The Nurseries, Great Bookham, was 2nd, chief among his flowers were S.B., Mrs. Bewick, Duke of York, Mrs. Douglas, and Dr. Hogg; C.B., Master Fred; S.F., Guardsman, Flamingo, and Huntsman; P.F., Agricola, Mrs. Douglas, and Gordon Lewis; R.F., William of Wykeham and Mrs. Rowan. 3rd, Mr. C. TURNER, Slough.

There were five entries of twelve blooms. Messrs. THOMSON & Co., Sparkhill, Birmingham, were 1st, with S.B., R. Houlgrave; C.B., Master Fred, Lord Salisbury, J. D. Hextall, and J. S. Hedderly; P.F., Maggie, Gordon Lewis, and Vulcan; S.F., Guardsman and Sportsman; R.F., Mentor and Mrs. May. Mr. F. A. WELLESLEY, Woking, was 2nd. He had S.B., R. Houlgrave; P.F., Charles Henwood; R.F., Thalia and Lady Mary Currie; S.F., Matador. 3rd, Mr. C. PHILLIPS, Bracnell.

There were nine stands of six blooms. Mr. A. R. BROWN, Handsworth, Birmingham, came 1st, with S.B., R. Lord and Evan Edwards; C.B., J. S. Hedderly; S.F., Sportsman; R.F., Merton. 2nd, Mr. F. HOOPER, Bath. 3rd, Mr. GEO. CHAUNDY, Oxford.

Self Carnations were a most imposing feature; they were numerous, and, in a few cases, very fine, the season appearing to have suited them better than the bizarre and flakes. MARTIN R. SMITH, Esq., Hayes (gr., Mr. C. Blick), was 1st, with some superb blooms, having, of maroon shades, Sir Bevis, Friar Tuck, and Sir F. Drake; crimson and scarlet: Mrs. Gray Buchanan, and Firebrand; rose: Mrs. A. Norman, Enchantress, Joan of Arc, and Exile; yellow: Cecilia, Falcon, and Miss Julia Harbord; blush and white, Kelpie, Hildegard, Helmsman, Purity, and Cordelia. Mr. J. DOUGLAS was 2nd, with some fine blooms, but they were unnamed. 3rd, Mr. TURNER, whose leading blooms were Little John, Mrs. R. Hole, Sir Guy, Germania, Duchess of Fife, Gold Mine, and Rose Unique.

The best stand of twelve was a very fine lot of blooms from Messrs. THOMSON & Co., who had Her Grace, Exile, Mrs. E. Hambro, Percy Conquest, Ruby, Germania, Nabob, Britannia, &c.; 2nd, Mr. C. PHILLIPS; 3rd, Mr. J. A. ROWBERRY, Woodford.

There were twenty exhibitors of six selfs, Mr. A. R. BROWN taking the 1st prizes with Royalty, Mrs. E. Hambro, Miss Audrey Campbell, Mrs. J. Douglas, Negress, and a seedling; 2nd, Mr. W. GARTON, jun., Woolston, Southampton; 3rd, Mr. R. C. CARTWRIGHT, Birmingham.

FANCIES.

Equally fine were these varieties, which may be said to include everything outside the bizzarres and flakes that is not a self or a yellow ground. Here again Mr. M. R. SMITH was 1st with a superb stand of flowers, which comprised Aglaia, Mulceter, St. Gatien, The Cid, Merry Duchess, Goldylocks, Elaine, Renegade, Maid of Honour, Zingari, Alexandra, Electra, Eothen, Allegra, Fairy, Guinevere, Persimmon, Lord Lieutenant, Don Carlos, and Hidalgo; 2nd, Mr. C. TURNER, who had smaller but well finished blooms of The Gift, George Craikshank, Potentate, Thos. Ayres, Primrose Queen, Alice Ayres, &c. 3rd, Mr. J. DOUGLAS.

With twelve blooms, Mr. A. J. ROWBERRY was 1st, Mr. C. PHILLIPS 2nd, and Mr. J. WALKER, Thame, 3rd.

With six blooms, Messrs. THOMSON & Co. were 1st with capital blooms of Cardinal Wolsey, Voltaire, Golden Eagle, Monarch, Miss M. Hill, and Socrates. 2nd, Mr. J. W. FOULKES, Chester.

A supplementary class for six selfs, one variety, brought seventeen entries, Mr. R. SYDENHAM, Birmingham, taking the 1st prize with splendid blooms of Cecilia, yellow self; Mr. J. DOUGLAS was 2nd with Mrs. Eric Hambro, white; and Mr. C. PHILLIPS 3rd with Regina, a yellow self. Also a class for six Fancies, one variety: Mr. R. SYDENHAM was 1st with Hidalgo; Mr. A. W. JONES, Handsworth, was 2nd with Golden Eagle.

Of single blooms of Carnations, there was as usual a considerable number. Mr. R. SYDENHAM, Birmingham, had the best S.B. in Richard Monk, a fine new variety of great promise, followed by R. Houlgrave and R. Lord; Mr. SYDENHAM also had the best C.B. in Master Fred, next to it coming J. D. Hextall. The best P.P.B. was William Skirving. Mr. SYDENHAM again taking the lead, Mr. M. ROWAN had the best P.F. in Gordon Lewis, George Melville, and Maggie, following in the order of merit; S.F. John Wormald, a new variety of last year, shown by Mr. R. SYDENHAM, and Sportsman; R.F. Merton, and Mrs. Rowan. White selfs: Mrs. Eric Hambro, The Bride, and Crystabel. Rose selfs: Exile, Royalty, and Perfection. Scarlet selfs: James Douglas, The

Cadi, and Lady Hindlip. Maroon selfs: Uncle Tom, Man-cunian, and Labby. Yellow selfs: Miss A. Campbell, Miss Wilmot, and Regina. Buff selfs: Mrs. R. Hole, a very fine bloom, being shown by Mr. TURNER, The Dyak, and Midas. Fancies: Voltaire, Monarch, and Eldorado.

Premier Blooms.—The selection of these is always a task of some labour. The premier bizarre was S. B. Admiral Curzon in Mr. M. ROWAN's twenty-four blooms, a variety which has stood for fifty years, and yet often comes out at the head of its class. The premier flake was Flamingo, S. F., shown by Mr. JAS. DOUGLAS. The premier self was Cecilia, a very fine yellow, shown by Mr. M. R. SMITH. The premier fancy was Hidalgo, also shown by Mr. SMITH.

Picotees.—These appeared to be on the whole better than the Carnations, as they were generally more refined, though there were many undeveloped flowers. The best twenty-four blooms in not less than twelve varieties came from Mr. C. TURNER, who had H. Red, E. Brunette, L. Red, E. Acme, and Mrs. Gorton; L. P. E. Mary, and Seedlings; H. rose E. Clio, Duchess of York, and Madame Richer; L. red E. Favourite, and Mrs. Payne; several seedlings were also shown. 2nd, Mr. J. DOUGLAS.

There were three stands of twelve varieties, Messrs. THOMSON & Co. staging a good dozen, chief among them H. red E. Brunette and Isabel Lakin; L. red E. Thomas Williams; H. P. E. Medhurst's Seedling; L. P. E. Somerhill, Mrs. Gorton, and Mrs. Openshaw; H. rose E. Lady Louisa; L. rose E. Mrs. Payne. 2nd, Mr. F. A. WELLESLEY, Woking.

There were twelve entries of six varieties, Mr. A. K. BROWN taking the 1st prize with H. P. E. Medhurst's Seedling; L. P. E. Henry Kenyon, in very fine form; H. rose E. Mrs. A. K. Brown, very fine; L. rose E. Mrs. Burnett, and Amy. 2nd, Mr. R. C. CARTWRIGHT.

The yellow-ground Picotees were highly attractive. The best twelve came from Mr. M. R. SMITH, a really superb stand, which comprised Duchess Lily, Badminton, Hygera, Lady Bristol, very fine indeed; Dinorah, His Excellency, Wanderer, also very fine; Duke of Alva, Volage, Vampire, Edith, and Fashion, which may be taken as representing Mr. SMITH's latest productions. Mr. C. TURNER was a good 2nd. 3rd, Mr. J. DOUGLAS.

Mr. GEORGE CHAUNDY, Oxford, had the best twelve blooms: Voltaire, Mr. Nigel, Agnes Chambers, El Dorado, Golden Eagle, and Sport were the best. 2nd, Messrs. THOMSON & Co.; 3rd, Mr. S. A. WENDT, Thames Ditton.

Picotees were also largely represented in the classes for single blooms. H. red E. Isabel Lakin took all the leading prizes; Mrs. Gorton was the best L. red E., followed by Thomas William and Lena; H. P. E. Medhurst's Seedling, L. P. E. Henry Kenyon, which took the first three prizes; and Somerhill, H. rose E. Madeline, Lady Louisa, and Little Phil; L. rose E. Rosie Sydenham, H. Scarlet E. Mrs. Sharp, Duchess of Albany, and Mrs. A. R. Brown; L. scarlet E. Favourite, Fortrose, and Lady Jane Churchill; Yellow-grounds, Wanderer, fine deep yellow-ground; and Mrs. R. Sydenham. The premier Picotee was H. scarlet E., shown by Mr. C. TURNER; the premier L. edge, Somerhill L. purple from Messrs. THOMSON & Co.; the premier G. G., Mrs. Douglas, from Mr. C. TURNER.

The next seven classes were for cut-blooms, exhibited without dressing or cards, the object being to exhibit the flowers as cut. With very few exceptions the blooms were small and ill-formed.

The main object of these classes appears to be as expressed by Mr. M. R. SMITH at the luncheon, to induce persons to take up the cultivation of the Carnation and Picotee for exhibition, to commence with these classes, and so be led on to show with dressed flowers in the more important sections. It was this fact which Mr. SMITH requested the reporters of the gardening papers to convey to the public, more especially as he thought these classes were not reported so fully as Mr. SMITH thinks they should be. So long as anything in the way of a Carnation or Picotee is admissible to these classes, however small or undeveloped, so will their importance be minimised.

Plants in Pots.—The best twelve specimens of any class came from Mr. M. R. SMITH, finely grown and well bloomed; they consisted of Sir Bevis, dark self; Chieftain, Endymion and Mrs. A. Gilbey, rose; Vesuvius, scarlet, very fine; Her Grace, blush; Cordelia, white; and Venus, yellow. Mr. J. DOUGLAS was 2nd, also with good specimens; included were Sappho, rose; Mrs. Jas. Douglas, rather darker; Helmsman, and The Briton, white; and of Y. G. and fancies, R. land, Mrs. Tremayne, Mohican, and Dervish.

The best specimen was Y. G. Golden Eagle, from Mr. SMITH; Mr. DOUGLAS coming 2nd with Saul, a yellow self.

The only group of plants in pots occupying a space of 50 feet came also from Mr. SMITH, and included generally a splendid lot of yearlings. Mr. J. DOUGLAS had the best 30 feet group.

Floral Decorations in Carnations.—The best dinner-table decoration was by Mr. H. ROGERS, Woodbridge, and consisted of pink Carnation set up with light Fern-fronds, grasses, and Asparagus; THE MORTEN STORES, LTD., Norwood, were 2nd. The best vase was from Mr. S. A. WENDT, fine blooms of various colours, beautifully fresh, were prettily arranged with appropriate foliage. Mr. BLICK had the best three sprays. Pink, white, and yellow Carnations were used. Button-holes were numerous, Mr. BLICK taking the 1st prize, and Mr. ROGERS the 2nd.

The Martin Smith prizes for bunches of Carnations grown in borders brought, as usual, a good competition. The best bunch of one variety was Jim Smyth, vivid scarlet, from Mr. H. G. SMYTH, Bloomsbury. Mr. J. COLLINS, Woodbridge, was 2nd. With six bunches of self-coloured varieties, Mr. J.

EUSTON, The Gardens, Great Gearies, Ilford, was 1st. Mr. WEGUELIN had the best nine bunches of flaked bizarre or fancy varieties, mainly white and yellow.

Certificates of Merit were awarded to the following new varieties of Carnations:—Cecilia, yellow self; Goldlocks, a very fine yellow ground, flaked and edged with scarlet; Enchantress, a salmon-scarlet self; Grand Duke, scarlet self; Benbow, an apricot self; Edith, a yellow-ground Picotee; Etna, a bright scarlet self; and Lady Bristol, a very pleasing yellow ground, all from the collection of Mr. MARTIN R. SMITH; also to Lady Frances Pratt, a dark crimson-maroon self of fine quality, from Mr. E. CHARRINGTON.

Miscellaneous.—Mr. J. DOUGLAS had a table of blooms of new and choice Carnations; Mr. HENRY ECKFORD fifty bunches of Sweet Peas; and Messrs. W. CUTBUSH & SONS, Highgate, Carnations, &c.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Phaius and Calanthes.—Such plants as *Phaius grandifolius*, *P. Wallichii*, *P. Blumei*, *P. assamicus*, *P. Sanderianus*, *P. bicolor*; the distinct hybrids, *P. Marthæ*, *P. Owenianus*, *P. Owenæ*, and *Phaius-Calanthe Arnoldiæ*, are sometimes discarded by Orchid-growers, owing to the amount of space they require; but if cut-flowers of an enduring character are required, they are especially useful and effective. At the present time the plants are in full growth, and require liberal waterings; but when they have completed their growth, only sufficient water must be given to keep the soil moist. Do not expose the plants to direct sunshine during active growth, but place them in a shady position in the East Indian-house or plant-stove, where they will receive fresh air daily in mild weather. The pure white *Calanthe veratrifolia* should receive similar treatment; but if any of the plants show signs of deterioration, remove them at once to a shady position in the intermediate-house. *Phaius Humbloti* has recently bloomed, and the young growths have already made some progress; and any re-potting that is required will be done at once, potting them like an ordinary greenhouse plant, with the surface of the soil just below the rim of the pot, the compost being of a firm though porous nature, such as fibrous loam, leaf-soil, and sphagnum-moss in equal parts, with a moderate amount of broken crocks. Give them plenty of root-room, and about 2 or 3 inches deep of crocks for drainage will be sufficient. Lay over these a little rough sphagnum-moss, and do not afford much water until the roots have become active, and are pushing through the compost. The pseudo-bulbs and roots being liable to the attacks of mealy-bug and scale, they should be made perfectly free from these insects before the plants are re-potted. *P. Humbloti* is a difficult plant to cultivate for any length of time together. Experiments have been made at Burford, and the plants cultivated in various temperatures, including the coolest division, also in different positions in each house; but it appears to thrive best when given the same treatment as advised above for the other species of *Phaius*.

Phalenopsis.—Amongst these which bloom at this season, mention may be made of *P. Luddemanniana*, *P. Marie*, *P. speciosa*, *P. violacea*, *P. tetraspis*, and *P. sumatrana*. As several of these varieties continue to bloom for a considerable time, it is well to remove their spikes after a few weeks. If any of the plants require fresh compost or new baskets, they should be attended to at once. All of the *Phalenopsis* named have green foliage, which is very susceptible to injury from the sun; therefore an extra shady position, in addition to the ordinary roof-shading, should be found for them in the hottest division. It is a good plan, where practicable, to place them under the shade of taller-growing plants, *P. Schilleriana*, *P. amabilis*, *P. Aphrodite*, *P. leucorhoda*, *P. casta*, *P. intermedia Portei*, &c., which are growing and rooting freely, should be well supplied with water. Suspend them near to the roof-glass in the East Indian-house, and allow them plenty of light, but shade always from direct sunshine.

The Cool-house.—*Sophronites grandiflora* now commencing to grow, may need to be repotted. This species should be grown in shallow pans, filled to within an inch of the rim with drainage materials, and a small quantity of peat and sphagnum-moss is all that the plants require. The best position during the heat of summer is upon the stage, with such species as *Odontoglossum crispum*. When the flower-buds are seen pushing up, elevate the plant

nearer to the roof, so that it may receive more light. Until re-establishment has taken place, allow each plant to become well dry before it is watered, and when the new growths commence to open at the apex care must be taken that no water be allowed to fall into them. *S. cernua* and *S. violacea* may be grown in the cool and shady part of the intermediate-house, and given plenty of root moisture. Such pretty Orchids as *Oncidium Phalenopsis*, *O. cucullatum*, *O. olivaceum Lawrenceanum*, and *O. nubigenum*, will now require fresh compost to root in, and thrive best in small pots stood upon the stage in the coolest and shadiest position available. A similar temperature is needed for *O. dasytile*, *O. cristatum*, *O. spilopterum*, *O. concolor*, *O. virgulatum*, *O. cheiophorum*, *O. varicosum*, *O. curtum*, *O. Forbesii*, *O. crispum*, *O. Larkinianum*, *O. Mantini*, &c., but these prefer shallow pans, suspended from the roof of the house. All of them should be plentifully supplied with moisture during the growing season. *Ornithidium Sophronites*, a dwarf-growing species, well deserves culture, its small bright scarlet flowers are very pretty and attractive. Suspend it to the roof with *Sophronites cernua*, and treat it exactly the same as that species.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Strawberries.—The ground should be got ready forthwith for the new plantations it is contemplated making. A moist, deep, retentive soil, suits the Strawberry best; but this being not obtainable in every garden, the utmost must be done to make the soil fairly suitable for the plants. As the plant requires much nutriment, plenty of half-decayed farmyard or stable-manure should be incorporated with the staple, as it is not good practice to dig the ground while the plants remain on it; and therefore, whatever is afforded in this way afterwards must be in the nature of a top-dressing. If strong, well-rooted plants be made early in the month of August, a crop of large fruits will be afforded the following season; and the best way to obtain very large fruits is to grow the plants for one crop only, as if kept for another or second year, a greater number of fruits is produced, but they are not so large, and in the third season there is a still greater falling off in size, and in the vigour of the plants; and after the third crop is gathered, the land should be cleared of the plants without delay. The land chosen for the plantation should have been trenched last winter or autumn, and it should now be deeply dug, and all big lumps broken with the spade as the work proceeds, for if large clods are turned in intact, there will be much settling down, which may hinder the growth of the plants. If the plantation is to remain for three years, the rows should be 2 feet apart, and the plants $1\frac{1}{2}$ foot apart in the rows; but if for one year only, the rows for the smaller-growing varieties may be $1\frac{1}{2}$ foot apart, and the plants 1 foot apart. The stronger growers should stand $1\frac{1}{2}$ foot apart each way. The mass of roots and soil must not be broken, but the soil, if in pots, should be well moistened before planting, or if they are lifted from the ground, the latter should be afforded water twenty-four hours previously. Make the soil firm about the roots with a wooden rammer, an operation specially required in dry weather. An occasional application of water may be needed till the plants establish themselves, and attention paid to the removal of runners as soon as they appear. The following are good varieties for general purposes, in their order of ripening; the best are marked with a * :—Laxton's No. 1, *Royal Sovereign, *Vicomtesse Héricart du Thury, *President, *Mentmore, *British Queen, *Dr. Hogg, *Guntton Park, *Richard Gilbert (Carmichael), *Queen of Denmark (Carmichael), *Waterloo, Veitch's Perfection, and Latest-of-All. Strawberries vary in their growth and bearing capacity, according to soil and climate, and fresh varieties should be tested on a small scale the first season. British Queen is a bad grower in some soils, but Dr. Hogg resembles it in many ways, and will succeed in most kinds of soil. [Gardeners should not omit to give a trial to Veitch's Prolific, figured in p. 78. Ed.]

Old Strawberry-beds.—Any of these which are going to be retained should be freed from all runners not required for planting, with the mulching and decaying foliage, but the fresh, healthy leaves should not be removed. All rooted runners should be lifted intact, and only original stools allowed to remain. After the beds are cleaned, the ground should be well stirred with Dutch-hoes, so as to hinder the evaporation of moisture.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Woolverstone Park, Ipswich.

Zonal Pelargoniums.—Plants intended for autumn and winter flowering should be making considerable progress, affording them manure-water, and occasionally soot-water in a clear state, when the plants have filled the flower-pots with roots. Very strong growths may be removed, and employed as cuttings, striking these either outdoors or in a cold frame. Such early-struck plants will bloom in May, June, and July next. Remove all flowers and decaying foliage.

Richardias.—Although *Richardias* may be planted outside, and they are then supposed to require but little attention before lifting them, if robust plants are wished for, it is prudent to assist them, particularly if the weather is very dry and warm, with a few thorough applications of water, and a damping overhead in the evening. If spathes appear on the plants, remove them, also decaying foliage.

Kalosanthes or Crassulas.—At the present season the bright-flowering and fragrant *Kalosanthes coccinea* is one of the most useful plants, and to enhance the brightness of their colour, the flowers should be allowed to open out-of-doors, and the plants then be put under glass. Cuttings may be made from ripe growths about 5 or 6 inches long, taken after flowering is past. The leaves for a space of 1 inch may be removed, and the cuttings inserted, to the number of either five round the side of a 48-pot, or three in a large 60, employing loam and plenty of sand, plunging the pots in a cold frame, and keeping them close and shaded till a sufficient quantity of roots are made, when the pots may be stood on a shelf in a greenhouse. The plants which have flowered should have the flowering-stems removed in part, and be stood out-of-doors till the colour of the rind indicates maturity, when they should be laid on their sides, but the soil not allowed to become dust-dry, or the foliage on the lower part of the stems will die off, giving the plants a naked appearance next year.

Campanula pyramidalis.—Seedlings which may have been pricked into pans, will be large enough to transfer into 4 or 5-inch pots, and a fairly rich soil. When potted and afforded water, place them out-of-doors on a floor of coal-ashes. The smaller plants may be planted outdoors, at 1 foot apart, for lifting and potting in the spring, and making a succession of flowering-plants to those grown in pots.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Stratfieldsaye, Hants.

Out-of-doors Tomatos.—As in this country the fruits on Tomato plants should be as completely exposed to the sun as possible, the lateral shoots of the plants should be removed whilst still quite small, and the leaves themselves reduced in size if they are not cut off. When the plants have set the desired number of fruits, pinch out the leading point and suppress every lateral. The Tomato plant requires abundance of water at the root in dry weather, and the fruits being subject to cracking if the affording of water has been overlooked, and then heavy rains fall, or a great quantity of water is afforded. Moreover dryness causes the blooms to fall without setting.

Late Peas.—The later sowings of Peas will be benefited by frequent applications of water, and by giving a mulching on both sides of the rows. Place more sticks to the late Peas than early ones, it will shade them a little from strong sunshine, as well as enable the bine to stand against autumnal gales.

Laying down Spring-sown Onions.—Should the plants appear exhausted, afford the land weak liquid-manure and clean the bed of weeds, then lay the tops down, doing this by hand, just bending the stems above bulbs and no more. Time may be saved if the quantity is large by pressing down the tops with the back of a hay-rake. It is a benefit to the plants, as growth is checked, and the bulbs rapidly increase in size.

Cauliflowers.—Afford water abundantly to plantations in order to avoid a check to the plants, mould-up finally the stems of plants that have reached 15 inches in height. Clubbed plants should be carefully drawn up and burned forthwith. Do not omit to break down a few of the inner leaves over such as show the curd, so as to preserve their whiteness, or to out them whilst still in fine condition.

Rhubarb.—The present is a suitable time to take stalks for preserving purposes; also to determine

which of the stools are going to be forced this year. Remove as many stalks as will not cause too great a check, leaving a sufficient number to enable the crowns to perfect themselves; and afford plenty of water at the root, but no liquid-manure at this season, as the aim should be early maturity of the crowns of such as will be forced.

Seakale.—Keep the plantations free from weeds, remove flower-heads, and afford weak liquid-manure copiously once or twice. The plant responds quickly to liberal treatment, and especially in warm, dry weather.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

The Carnation and Picotee.—Continuing my remarks in last week's calendar, I enumerate a few varieties which are acquisitions as bed or border flowers: Bendigo, flowers well formed, held erect on stout footstalks, colour bluish-purple, the habit good, and growth vigorous; Cowslip is a yellow ground Picotee, edge bright rose, with a good calyx and strong growth; Duke of Orleans, a deep shade of yellow, large flowers and a good grower; Eldorado, bright yellow flowers edged and marked with bright red, large flowers, habit vigorous, the best of its colours, Golden Eagle, a bright golden yellow flower, marked bright red, good form, and large; Marigold, bright orange, shaded with apricot, marbled carmine, the plant is a good grower, and a continuous bloomer; Miss Audrey Campbell, yellow, large flowers, and an abundant bloomer. Miss Ellen Terry, probably the largest of the white Carnations, the white very clear, and the plant a good doer; Nabob, flowers orange-buff, not very large, a good calyx, excellent habit, and a very free bloomer; Mrs. Gordon, a clear yellow flower, margined with pale rose—a well-formed flower, very distinct, a robust grower, and free; President Carnot, a large yellow-ground fancy, heavily edged with scarlet; Chameleon, fancy, with heliotrope-coloured ground, flaked with pink—a taking flower of a singular colour; Duchess of Portland, white fancy, pencilled and edged with pink—a large flower, fragrant, and a free bloomer; Edith Ladenham, white, of a large size, and very pretty veining; Greit, pale apricot, with blue markings—a novel and fascinating colour, of good habit, an abundant bloomer, and vigorous; Maid Marian, pale pink flowers, which change to white as it ages—flowers of middle size; Mrs. R. E. Clark, an immense large flower with fringed petals, deliciously scented; Paradox, bright scarlet flowers of good habit, will eventually supersede many of the old varieties of its colour; Sweetheart, flowers of apricot yellow, a fancy, flaked and edged with carmine, a large flower with a calyx which does not burst—an effective variety. There are many others of recent introduction, which are as good as some of these I have named, but which I have not as yet tested out-of-doors.

Bedding Plants.—The great heat and drying winds have dried up the surface moisture, and rendered heavy applications of water very necessary in south country gardens, and fortunate is the gardener who possesses a sufficient water supply. If the water fails or is short do not afford dribbles, as doing so does more harm than good, but let them take their chance, and keep the surface of the beds not covered with foliage frequently stirred, so as to prevent the evaporation of moisture; the roots will descend, attracted by the dampness in the subsoil, and they will then find enough to prevent flagging. If Cannas are grown, water should, if possible, be found for them, and a mulch of short-dung or half-rotted tree-leaves, two inches thick, laid over the roots. The same advice holds good of Tobaccos, Wigandias, Solanums, and other large-leaved subtropicals.

Carpet-bedding Plants must be frequently regulated, and the points of the shoots nipped out, and the patterns kept sharply defined.

Dahlias, which are now beginning to show flowers, benefit from frequent applications of weak liquid-manure, making a broad, shallow, basin-like depression round each. All weak and superfluous shoots should be removed, and plants rigidly kept to one stem. Gladiolus should also be afforded liquid-manure occasionally, and the soil about the plants stirred frequently. Fasten the stems of Lilium auratum to stout neat stakes, and apply liquid-manure. If water can be spared for the herbaceous perennial border, the plants will remain in good bloom for a longer period than would otherwise be the case. This border will require considerable attention in the removal of seed-vessels, spent flowers, and in making

the plants secure against the wind. If Wallflower, Myosotis, and Silene pendula seeds be not sown, no time should be lost in getting it done. Sow broadcast on a well-prepared piece of land, covering the seeds with fine soil, and keep it moist.

THE APIARY.

By EXPERT.

(Continued from p. 49.)

Now if the harvest is Basswood, commencing to bloom, say, July 7, the egg for our labourers should be laid on or before June 1. But how shall we secure the laying of the eggs just when we want them? There are several ways of doing it, such as feeding the bees with thin sweets when you wish the queen to lay more prolifically, giving young bees from other colonies that will feed the queen with a larger amount of egg-producing food, &c., but I will here speak only of the plan that has proved most successful in my hands, with the least drawback of any I have ever used. About May 10 to 20, according to the weather (if warm or an early season, the 10th; if cool, or a late season, then the 20th), I commence to do what is known as "spreading the brood," which is simply reversing the brood-nest at this time, putting the combs having the least brood in them from the outside to the centre, and those having the most brood on the outside. This stimulates the queen to fill these rearing, broodless combs with eggs clear down to the bottom and out at the sides, laying twice the eggs she had been during the days just past. In a week or so the combs of eggs and larvae are spread apart, and a frame of comb having honey in it set between them. The removing this honey causes great activity; the queen is fed abundantly, and the comb is filled with eggs in a "twinkling." If the colony is strong in bees, and we have the combs of honey on hand, two combs can be set in at this time. In a few days more the brood is reversed again, soon after which the brood is likely to fill every comb except the two outside ones, and these will soon be admitted into the brood circle. This plan of manipulation causes the queen to fill the cells much more quickly with eggs than she would otherwise have done, and thus many valuable bees are gained, so that there will be a multitude of labourers at the right time; and, as I have often proved (by manipulating one row of lives in the yard, leaving another row untouched), nearly twice as many as there would have been had the bees been allowed to take their own course. In this way the best possible results in honey are secured, and I would advise any beginner to familiarise himself with this method.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Cucumbers for Frames.—Young Cucumber plants, raised from seeds sown about a month ago, as previously advised, may now be planted upon small mounds of light, rich soil, consisting of three parts light loam and one part old Mushroom-bed manure. As soon as planed, place a stick to each of the plants, and secure them from accidental injury. They will need to be soaked at the root with tepid water, and should be shaded for a few days from bright sun. These plants will bear fruits in succession to those in yield at the present time. To furnish plants for winter fruiting, seeds should be sown or cuttings struck at once. Select those varieties that are known to be free-bearing, and good winter fruiters, such as Rollisson's Telegraph. If any plants have been bearing throughout the season, and are required to do so further, it will be well to give them another top dressing, of about 2 inches deep, using the same compost as before. Examine them frequently, and remove some of the old bine and leaves, and stop the young shoots after the third pair of leaves to prevent over-crowding. Continue to afford copious supplies of water at the root as frequently as may be necessary. Syringe the plants several times each day, and close the house early in the afternoon, thus making the best use of the sun heat, and rendering less fire heat sufficient.

Melons.—Plants now in flower will need to be gone over each day at noon, with a view to impregnation of the blooms. Maintain a rather dry atmosphere, and an appreciable degree of warmth in the hot-water pipes in dull weather. The roots should be kept on the dry side for the time being, but not sufficiently so as to cause the plants to suffer. A warm growing atmosphere is essential to plants with fruits now swelling, and a liberal syring-

ing at closing time may be given upon fine days. Should the weather be dull, it will be sufficient to damp the surface of the bed, and the floor of the house. Stop the lateral growths frequently, and afford root-waterings before the soil has become too dry. Syringing should cease when the fruit has commenced to colour, and at the same time less moisture will be sufficient. Fruiting-plants in frames, provided the soil rests upon hot beds, do not require so much water. The surface soil may be permitted to become quite dry before water is afforded, and the last time should be a few days before the fruits will show colour. Success in Melon-culture in frames depends much on the making the most of sun-heat, by closing early in the afternoon, at the same time damping the foliage and the side of the frames by means of a syringe; two o'clock being not too early, on the brightest of days. Should black Aphis appear, fumigate with Richards' XL-All.

Tomatos for Winter Use.—The plants may now be potted into their fruiting-pots, such as 24's or 16's. A compost I have used for several years for Tomatos in pots consists of 6 parts loam, 1 of leaf-mould, and 1 of burned earth, or old mortar-rubble. Use clean pots, and if these are new soak them in water for a few minutes beforehand. Provide a depth of about 2 inches crocks for drainage, and cover this with a thin layer of moss, or the rougher and more fibrous parts of the soil. Pot firmly with a rammer, and see that the soil is moderately moist before use. After potting place a stick to each plant, afford a gentle watering, and for a few days shade the plants from the sun. In order to obtain a sturdy, short-jointed growth, keep them in a light airy situation near to the glass; fire heat being required only at present during dull, damp weather. Maintain a somewhat dry atmosphere, and remove side-shoots as they appear.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 23, is furnished from the Meteorological Office:—

"The weather during this period was somewhat less settled than that of the week immediately preceding it; a good deal of cloud prevailed at times, and rain was occasionally experienced in all parts of the kingdom. Thunderstorms occurred in some parts of Ireland and central England on Friday, the accompanying rainfall being exceptionally heavy in portions of our north 'Midland Counties.'

"The temperature was again slightly above the mean in most districts, but just equalled it in 'England, N.E. and E.' and in 'Scotland, W.' and was a little below it in 'Scotland, N. and E.' The highest of the maxima were recorded either on the 17th or 18th over England, but later in the week in Ireland and Scotland; they ranged from 82° in 'England, S.' and from 76° in 'Ireland, N.' to 73° in 'England, N.W.' and 'Ireland, S.' to 72° in 'Scotland, N.' and to 70° in 'Scotland, W.' The lowest of the minima, which were mostly recorded about the middle of the week, ranged from 33° in 'Scotland, E.' 36° in 'England, N.E.' and 38° in 'Scotland, N.' to 47° in 'England, S.W.' 52° in 'Ireland, S.' and 54° in the 'Channel Islands.'

"The rainfall was less than the mean in all districts. In the south and east of England the fall was very slight, but at York and Bawtry the amounts recorded during the thunderstorm noted above were 1.57 and 2.15 inches respectively.

"The bright sunshine was less than the mean in nearly all districts, but rather above it in 'Scotland, N. and E.' The percentage of the possible duration ranged from 44 in the 'Channel Islands,' and 38 in 'England, S.' to 25 in 'Ireland, S.' and to 2 in 'Ireland, N.'"

ORCHID-BLOOM IN VARIETY.

(Remainder of Markets carried forward to p. vii.)

NOTICES TO CORRESPONDENTS.

A BRAN FROM QUEENSLAND: *J. D.* The information afforded is insufficient.

APPLE DISEASED: *S. W. P.* The "blight," really a minute species of fungus, should be got rid of by syringing the trees with Bordeaux Mixture. The fruit should not be used till rain has fallen in abundance to wash the fruits. Recipes for making the mixture have been often given in these pages.

BOOKS: *A Young Subscriber.* *The Tomato: its Culture and Uses*, by W. Iggulden, published at 12, Mitre Court Chambers, Fleet Street, E.C. Price 1s. — *V. P.* *Handbook of Hardy Trees and Shrubs and Herbaceous Plants*, by Decaisne, Naudin & Hemley, published by Longmans & Co.

CATLEYA GASKELLIANA VAR. ALBA: *J. R.* We have failed to run the notice of the plant down; can you not give a nearer reference?

CYPRIPEDIUM SPECTABILE: *Veritas.* The plant is hardy. It should be planted in bog-earth or peat, in a naturally moist spot in the garden.

GRAPES: *Beginner.* The berries are "shanked" and split, and decay has set in. Nothing you can now do will save the crop. There must be something much amiss with the border, or the Vines are suffering from previous over-cropping, and doubtless from mistakes also in the management this season. Examine the border, and if the soil is found to be in a pasty, close, wet state, and few healthy roots found therein, you may conclude that only radical measures will be of any avail. When you examine the border, send us a fair sample of the soil and roots, and some foliage and shoots, and we will advise you further. Purchase some work on the cultivation of the Vine, as Mr. A. F. Barron's *Vines and Vine Culture*, published at *Journal of Horticulture* Office, 12, Mitre Court Chambers, Fleet Street, and study it attentively.

GREEN-FLY IN ODONTOGLOSSUM-HOUSE: *Perplexed.* Vaporise with Richards' XL-All. It will not hurt the plants or blooms if you follow the directions sent with the stuff.

HOLLYHOCK LEAVES DISFIGURED: *A., Nottingham.* The rustiness is due to evaporation of moisture from the surface of the leaves. There is no trace of fungous or insect pest at present.

LAWN TENNIS MANUAL: *H. White.* We do not supply the manual; apply to Mr. Upcott Gill, 171, Strand, W.C.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.* — *A. J. L.* Iris Golden-stactiana. *J. G. Baker.* — *W. Young.* 1, Lelia crispa; 2 and 3, varieties of Coleus, which we cannot name (consult some nurseryman who grows them); 4, Campanula isophylla, white variety; 5, Campanula isophylla, quite impossible to name the Carnation. — *H. R. G.* 1, an immature form of Pteris aquilina; 2, Polypodium vulgare; 3, Hieracium sabaudum; 4, Serratula tinctoria; 5, Lotus corniculatus; 6, Alisma Plantago; 7, Hypericum pulchrum. — *C. B.* 1, Hedy-sarum coronarium; 2, Ligustrum lucidum; 3, Lychnis chalcidica; 4, Centaurea rubra; 5, Achillea Millefolium, rose-coloured variety; 6, Jasminum floribundum. — *S. W. P.* Hypericum Andromedum. — *Rosa.* 1, Arrhenatherum avenaceum; 2, Eragrostis superba; 3, Eragrostis filiformis. — *J. May.* Bromus secalinus var. velutinus. — *C. A. B.* 1, Campanula urticifolia; 2, Campanula urticifolia alba; 3, Borago officinalis; 4, Hieracium aurantiacum; 5, Dipsacus glutinosus; 6, Daphne Mezereum. — *J. R. P.* 1, Veronica Andersoni variegata; 2, Choisya ternata; 3, Acer Schwedleri; 4, Acer platanoides. — *J. C.* Ornithogalum arabicum. — *E. S. R.* 1, (E)nothera Youngi; 2, Salvia

bicolor; 3, Iris foetidissima; 4, Galium verum; 5, Eugenia myrtifolia; 6, Fuchsia corymbiflora.

NARCISSUS: *C. H. W.* Two single flowered—Grand Monarch, white, with yellow cup, and Her Majesty, pure white. These are Polyanthus varieties. Two double-flowered—Early double Roman, white, and N. odoratus minor plenus, golden-yellow.

PEACHES: *C. H.* The splitting of Peaches is generally caused by excessive watering after a period of drought.

POLLARDING TREES: *G. R. M.* The following species may be pollarded:—Carpinus in variety Hornbeam, Acer (of Japanese species we have no experience), and the more effective are pennsylvanicum, platanoides in variety, rubrum, tartaricum, colchicum rubrum and fraxinifolium (Negundo and N. variegatum), Aesculus, Horse-Chestnut, but it does not live to a great age if pollarded; Celtis, Fraxinus excelsior, Morus (Mulberry), Quercus of all species, Salix, Tilia, all species. Pollarding is best done at the fall of the leaf, and whilst the trees are under twenty years old, although there is scarcely any limit to age. However, in young trees decapitation leaves a comparatively small wound to heal over, which is not the case in large trees.

QUITTING SERVICE: *C. H. W.* The agreement being for twelve months, the labourer leaving before the expiration of the year, forfeits his bonus of £2. You cannot force him to stay if he desires to leave the service, unless you take action, and we doubt if you would be successful.

ROSES FOR GREENHOUSE WALLS: *A. J. L.* You might add W. Allan Richardson and Catherine Mermet, or the climbing Devonensis.

SHADING FOR GLASSHOUSE: *Perplexed.* Coat with sour milk; to make it more opaque, you may add a little whiting.

SPRAYING TOMATO-PLANTS WITH SULPHIDE OF POTASSIUM AND WATER: *Tollesbury.* At any time after the crop of fruit is set, choosing a dull but not wet day, and preferably in the evening.

STAKE FOR SECURING CARNATION STEMS: *Captain Walker.* Most florists and horticultural sundries-men keep them for sale.

STRAWBERRIES BITTEN OFF AND LAID IN HEAPS: *J. S.* The mice are the delinquents, and you should clear them off, if possible, early in the year. But they do not always perform such pranks.

TOMATOES, &c.: *'Bus.* It is quite easy to grow Tomato in flower-pots, and no doubt that you can do so successfully in the glasshouse hitherto made use of; but why not incorporate a good quantity of fresh loam, lime-rubbish, and charred soil, removing as much of the old staple, and continue to plant-out? It gives better returns, and is less costly in every way. You might make a beginning with the cultivation of Cucumbers, Melons, Grapes, Strawberries, which if got into the market early, secure remunerative prices. The following kinds of flowers pay to grow, viz.:—Eucharis in variety, Roses, bleached Lilac, Odontoglossum crispum, Cattleya labiata, and other species of Orchids, Ferns, Smilax, Primulas, Stephanotis, &c.; Bouvardias, zonal Pelargoniums, and many more, as cut-blooms and as plants, mostly the former.—*J. P. A.* The "sleepy disease," concerning which so much has been said in the *Gardeners' Chronicle*. There is no cure. Burn the plants.

TOMATOES GOING OFF: *J. Smith.* Insufficient material. Can you not send leaves and portion of stem. The roots were not affected by eel-worms; and the disease may be induced by excess of moisture in the air, and at the root. The plant is a native of a country which has a meagre rainfall.

VINES: *R. K.* The leaves are suffering from the so-called "browning" disease. Cut off the worst and burn, and dress the foliage with sulphide of potassium, ½ oz. to the gallon of warm rain-water.

WORTHING RATING CASE: *J. H.* There have been cases recently decided, in a sense opposed to the judge's decision, arrived at on the occasion of this test case being carried to the Court of Appeal, as reported in our columns, p. 676, vol. i., 1887.

COMMUNICATIONS RECEIVED.—*C. T. D.*—*A. M. M.*—Garton, Junior.—*F. Fairbairn* and *W. B. Upjohn*, received too late for insertion.—*P. E.*—*W. S.*, Ghent.—*M. Cogniaux*, Verviers.—*M. Heron*.—*E. THE

Gardeners' Chronicle.

SATURDAY, AUGUST 6, 1898.

THE CHRONICLE OF A LITTLE CORNISH GARDEN.

JULY.—The month of Carnations has, perhaps, more flowers to give us than any other month in the year, yet the garden has passed its time of greatest interest. When the hedges had little but earth and grass and leafless twigs to show us, our Crocuses and Snowdrops had a value beyond estimation. Steadily, month by month, the garden display has been continuously increasing in splendour and amplitude. After the first glory of the Roses has waned, however, a general feeling of the "beginning of the end" seems to dawn on the garden. At the end of June the real feature of the pageant—the royal carriage of the procession—seems to pass before our eyes, and though equal or greater beauty or splendour may be yet to follow, our enthusiasm can but be on the ebb. Moreover, we are not so dependent on our gardens for beautiful flowers now that we may find flowers everywhere—hedges fragrant with the "söote Wodëbynde," towans purple with "bees-alluring Thime," and yellowing corn-fields blotched with scarlet. The weather, also, is far too hot and oppressive for enthusiasm, and we feel that the shade of trees, "a flask of wine, a book of verse," and a fellow idler, are more according to the month's temperament than active gardening.

Now, more than ever, is it obvious that "a garden without trees scarcely deserves to be called a garden." Shade at any price is wanted, and I note with gladness the progress my trees are making. These are, with the exception of a Chestnut, all fruit trees; and I know of few more beautiful sights than a Crab or Pippin in bloom or fruit. If I can find room in the autumn, I mean to plant a Medlar and a Mulberry-tree. Of the former, Canon Ellacombe says:—"I never saw a Medlar that was not of a beautiful shape, and it makes a more natural tent or arbour than any other tree." That surely describes a "real want" in July.

Though shade is so important to our pleasure, we must try to maintain some open ground, and this is essential if we would grow "the fairest flowers of the season." In many ways, the most beautiful of all garden flowers, full of associations, yielding sweetest scent of "summer spice," and of lovely and definite colours, the Carnations has long been a universal favourite. It is to be counted to our good fortune that those florists—professional and amateur—who are now working hardest at the production of new varieties of Carnations, are doing their utmost to give us kinds for the decoration of the garden, as well as specimens to figure on the show-benches. The habit of the plant is receiving attention equally with the character of the blooms. A really successful bed of Carnations must contain no weak growers, or half the beauty of the bed will be gone; abundant foliage should cover the

ground allowed between the plants. It must contain only plants which carry their flowers erect, or it will give us merely a picture of a bundle of sticks and raffia (of course, an occasional stake is generally required, in which case it should be as little obvious as may be); there must be no habitual pod-bursters—although nearly every kind occasionally bursts its calyx—and, as far as possible, the kinds chosen should be free-bloomers.

Just at present, self-coloured kinds are receiving special attention, and they are, on the whole, the most valuable in the garden; but I would by no means grow only selfs. Varieties of every class—fancies, flakes, bizarres, and Picotees—succeed in the open air, and many are very beautiful. Even yellow-grounds do well in the open in many gardens, and these are perhaps the most attractive of all. Among the most beautiful yellow-ground Carnations are Cardinal Wolsey, The Czar, The Dey, Czarina, George Cruickshank, and Brodrick; whilst Mrs. Douglas, Voltaire, Florrie Henwood, and Golden Eagle, may be taken to represent the best yellow-ground Picotees. Yellow Carnations are mentioned by both Gerard and Parkinson, and have had periodic attacks of popularity since their times. One point to bear in mind is, that they usually bloom a little later than the other classes.

I have already commenced layering, and have taken and planted some cuttings. The latter seems to be the common method of propagation adopted in America, but it is said to produce plants which bloom rather later than those from layers. This fact, if it be a fact, should be useful in obtaining a longer period of Carnation-flowering than is usual. I have collected a substantial pile of material for a bed which I mean to make for next year. Carnations cannot bear fresh manure, and as there is some difficulty in obtaining any quantity of top-spit, I have got together a few loads of road-scrappings, old hot-bed manure, and a little leaf-mould, and mean to thoroughly incorporate these with the soil to a good depth, moderately deep planting being an important point. I want to have my bed ready and planted not later than the beginning of October, and have been deciding on the kinds I shall grow. I have made up my mind to have the bed a mixed one, and the following selection will give an idea of my list so far as I have constructed it:—Mephisto (deep crimson self), Sadek (rich rose), Miss Audrey Campbell (large primrose self), Mrs. Eric Hambro (a perfectly formed white self), Mrs. Colby Sharpin (cinnamon), The Czar (yellow ground, margined purple), George Cruickshank (orange ground, flaked crimson), Cardinal Wolsey (yellow ground, flaked red), Stadtrath Bail (yellow ground, edged scarlet), Master Fred (crimson bizarre), James Douglas (purple flake), Robert Lord (scarlet bizarre), Sportsman (scarlet flake), Mrs. Rowan (rose flake), and the yellow ground Picotees above-named.

Of course, as it grows in the wild state, the Carnation does not frequent "made" beds or pots of earthenware. High up on limestone rocks, in the crevices of old castle-walls—as at Rochester, Les Andelys, and the Château Gaillard—and in like places, often apparently devoid of "soil," the *Dianthus Caryophyllus* lives perpetually—requiring no stakes, but hanging its rosy flowers "downwards" in masses visible to all. The natural habit of the Carnation should teach much to those of us who grow plants as plants, and not as show monstrosities. I mentioned last month that I proposed to plant some clumps of Daffodils among my Carnations, but I am now in doubt as to the wisdom of this course, seeing that the Carnation-bed will require a thorough re-making and re-planting every autumn, whereas the Daffodils benefit by being left alone. I now feel inclined to plant clumps of Crocuses, and early and late Tulips instead.

The summer Roses are nearly over, but the Teas are glorious. Every one of my young bushes has numerous expanded blooms or buds, but of them all I think the most beautiful is a Rose which I cannot find even mentioned in the catalogues. I bought it

two years ago in a cheap lot of "half-a-dozen Roses for half-a-crown," and to-day I counted thirty-eight blooms on the little plant. The Rose to which I refer is Marie d'Orleans, which was raised fourteen years ago by M.M. Nabonnand, of Golfe-Juan. Their catalogue description of it runs: "Flowers bright rose, very large and full; the habit of the bush very vigorous; an abundant and beautiful bloomer." The colour, however, is much more than this description implies—being a beautifully bronzed red, which has not the slightest tendency to become wasty as the bloom expands. The foliage (which is dark green), the reddish spines, the long buds, and the open flowers, are all beautiful, so that it seems to be one of the perfect Roses. If I am correct, why is its name absent from so many English catalogues?

Another Rose (a hybrid Tea), which has been very satisfactory, is Marquise de Salisbury (introduced ten years ago by Léveque), a profuse bearer of most fragrant semi-double velvety-crimson Roses of rather small size. This, again, is a Rose, beautiful both in the bud and fully open condition—an important and valuable characteristic when one reflects how many Rose-bushes with numerous buds, and partly expanded flowers of great beauty, are disfigured by an equal number of fully-expanded blooms which have neither beauty of form nor colour.

Of all my Roses, however, the most continuous bloomer has been Baronne de Maynard, a hybrid Bourbon of moderate habit. It bears numerous beautiful white Roses, of purest colour and perfect form. Gloire de Dijon has not come up to my expectations: scarcely a bloom has had anything which could be called shape, but of course it is a free-bloomer and is very fragrant, so that one must not grumble too much; but it is so universally recommended as the Rose for all purposes that one's anticipations are likely to fly a little too high. Turner's Crimson Rambler is growing vigorously over an arch, but has not bloomed this (its first) year. Madame Alfred Carrière, Maréchal Niel, Niphetos, William Allen Richardson, Bouquet d'Or and Céline Forestier are a few of the Roses I have found most satisfactory all round. The cherry-coloured Roses (such as Cheshunt Hybrid and Alfred Colomb) are very beautiful when fresh opened, but acquire a dreadful colour in the course of a day or two.

Next to Roses and Carnations, Hollyhocks, Sweet Peas, and Shirley Poppies are now most noteworthy.

"... a garden full of bees,

Large dropping Poppies, and Queen Hollyhocks,"

is a fair description of mine as seen at the first glance. The tall pyramids—rose, pink, white and yellow—rise high above the other plants of the border, for many of the Hollyhocks are more than 9 feet high. So vigorous are they, that I have not staked a single plant as yet, and no sign of "the disease" to which the "holy mallows" are subject has appeared. Seen from a little distance the handsome spires of the yellow Evening Primrose, *Oenothera Lamarckiana*, might easily be mistaken after sunset for great single Hollyhocks. A point with these plants is to remove the withered flowers each day, or a very untidy appearance results. The white *Oenothera taraxicifolia* is also a beautiful flower, opening in the evening, and is especially valuable in July, when strolls round the garden are most enjoyable after the sun has set.

The Sweet Pea hedge has been, and is, perfect. Keats' description strikes me as among the very best flower-picture in poetry:—

"Here are Sweet Peas, on tip-toe for a flight,
With wings of gentle flush o'er delicate white;
And taper fingers catching at all things,
To bind them all about with tiny rings."

Sweet Peas require the constant picking of pods, if the flowering is to be continuous. I have just topped the hedge with the shears, and hope to induce a free new growth from the base, and abundant autumn flowering. The scent of the Sweet Peas is deliciously wafted by the breezes, so that few plants better serve to climb near arbours or garden seats.

The Lavender-spikes and "Cheerful Rosemarie," also, are beautiful and sweet possessions. What a debt we owe to the bees—which debt I have sorrowily increased by stealing some forty-two sections from

my hive already this season—through whose taste we are able to enjoy the fragrance of Thyme and Mint, Balm and Marjoram, Lavender and Rosemary. For all these labiate herbs are chiefly fertilised by bees, and are accordingly modelled to their liking. The curious little covering of hairs which conceals the fruits in the old fertilised flowers of the Marjoram is seen to be held back against the calyx by the corollatube in the flowers just opened. The object of the covering is of course to hide the ripening seeds from graminivorous birds.

These sweet herbs used to have a much more important place in the garden than at present. It is now rare for those responsible for the care of gardens to plant herbs and bushes for their fragrance only; yet the pleasure obtainable is full as much as, though more delicate than, that yielded by beautiful flowers devoid of scent. In Elizabethan gardens, however, fragrance was counted as important as beauty, and Bacon directs the planter to grow numerous flowers and herbs that "doe best perfume the aire," and also "those which perfume the aire most delightfully, not passed by as the rest, but being troden upon and crushed."—"That is Burnet, Wilde-Time, and Water-mint. Therefore, you are to set whole allies of them, to have the pleasure when you walke or tread."

Of all the herbs, Rosemary seems to have been most esteemed, and was, as of course everyone knows, a symbol "for remembrance;" even as early as the fourteenth century it was considered an embodiment of all the virtues:—

"This herbe is callit Rosemaryn,
Of vertu that is gode and fyne;
But alle the vertues tell I ne can,
Ne I trawe no erthely man."

I suppose we shall never take such an extreme view of the benefits of growing Rosemary as that of this writer, still the pleasures to be obtained from Mignonette and Sweet Briar, Sweet Peas, Thyme, Lavender and Rosemary, are so great that one cannot understand how it is that so few plants are grown for their perfumes alone. *Harry Roberts.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM NEBULOSUM PARDINUM.

The blossoms of *Odontoglossum nebulosum* are generally white, spotted with red-brown on the inner halves of all the segments, but occasionally an unspotted form is observed. On the other hand, the variety *O. n. var. pardina* is white, densely spotted with reddish-brown over the greater part of its surface, the large fleshy callus and base of the lip being of a bright yellow, as in all the other forms of the species. A very fine variety of it, densely spotted except the tops of the segments, and having a faint olive-green tint to the basal spots, is sent by H. Cary Batten, Esq., Abbots Leigh, near Bristol.

CATLEYA DOLOSA.

A flower and a clever sketch of a plant which is doubtless of this rare species, which is usually represented in gardens by the better form of *Catleya Walkeriana*, is sent by Messrs. Charlesworth & Co., Heaton, Bradford, who imported the plant as *C. Schroderiana*. The pseudo-bulbs, most of which bear two leaves, are from 3 to 5 inches in length, and slenderer than those of *C. Walkeriana*. The flower measures 4 inches across; the sepals and petals are of a bright deep-rose tint, and the lip has not the distinct separation of the front and the side lobes of *C. Walkeriana*, and in that and other respects it more nearly approaches *C. × O'Brieniana*, is white at the base, and tinged with rose towards the upturned edges of the side lobes. The slightly-connected median area of the lip is of a primrose-yellow tint, and the border of the front lobe a bright rose-purple. The upper surface of the fleshy column is rose-pink, and the whole flower strikes one as belonging to a plant that is probably of hybrid origin, rather than a distinct species.

CATLEYA WARSCEWICZII VAR. SATURATA.

This handsome variety has a lip of a rich amethyst-purple tint, with the patches of a cream-white colour,

usually seen on the sides of the lip in the typical *C. Warscewiczii* suppressed. In the variety *Rothschildiana* the base and sides of the lip are traversed by reddish-purple lines, and in a very handsome form, which D. B. Rappart, Esq., Mere Bank Promenade, Liscard, has sent for inspection, the colour is brighter than in the original, which flowered with Messrs. Backhouse & Sons, of York, in 1892. This form likewise possesses the reddish lines observed in *C. W. Rothschildiana*, and on each side of the lip there appears a very small spot, clearly defined, and of a primrose colour, that heightens the dark and other tints of the rest of the flower. *J. O'B.*

SHORT NOTES ON BULBOUS PLANTS.

BESSERA ELEGANS.—A pretty little bulbous plant, not usually seen. It has a Rush-like leaf, 1 to 2 feet long, and from four to six pedicellate drooping flowers, borne on a long slender stem, 2 feet long. The segments are vermilion in colour, three-quarters of an inch long. The projecting filaments and style are purple, and the anthers contain iridescent green pollen. It would make a fine addition to the conservatory, on account of its light, airy, and graceful contour, and a combination of colours rarely seen. The bulbs should be kept moderately dry in the winter.

Herbertia pulchella.—An extremely pretty and somewhat rare Irid, of small growth, from South America. It has a branched stem a foot long, and produces from eight to twelve flowers, from 2 to 3 inches broad, of a deep satiny-blue, the outer segments having a narrow white band from the middle to the base; one to three flowers are open at a time, which only last for a single day. From four to six bulbs should be put into a 5-inch pot, plunging outside during the summer, and storing in the Cape-house when the foliage dies down, and keeping it dry till the spring.

Cypella plumbea.—A remarkable Irid, of singular lead colour, with the base of the segments mottled yellow on a brown ground. The inner segments have a blotch of blue on either side; best grown in pots, keeping dry in winter, and storing in Cape-house.

Zephyranthes (Hippeastrum) brachyandrum.—As a pot plant for the conservatory in June or for summer plunging in the rock-garden, this species cannot fail to attract attention. The flowers are solitary, and are borne on a spathe about 1 foot high. The colour varies somewhat from a light blush to rose; a fully-expanded flower measures from 2 to 2½ inches across, and remains in perfection three or four days. I usually grow them six to eight in a 5-inch pot, in a compost of loam, with about one-tenth of its bulk of basic slag graded to about the size of Peas. This keeps the soil sweet for several years, and affords just sufficient stimulant for these small bulbs. It produces seeds readily, which should be sown as soon as gathered, germinating in a temperature of 60°, removing the seedlings to the Cape-house when well advanced; seedlings with me flower under two years. The bulbs are somewhat prolific in offsets, so that they can be increased readily by this means also. Dry off the flowering bulbs in the winter, and store in the Cape-house.

Z. candida.—A very pretty white-flowered species, of a somewhat cupped form, like a *Crocus*. It flowers in June and July; the spathe is 1 foot high, and the leaves are dark glabrous green, somewhat thick for a *Zephyranthes*, and nearly cylindrical, and measure 1½ foot long. It is more robust than *Z. brachyandra*, and I find 4 to 5 bulbs to a 5-inch pot sufficient. Like the preceding species, it should be dried off in the winter.

Z. gracilifolia bears a pretty flower, somewhat smaller than the two preceding species, of a rich rose-pink colour; it measures about an inch across. The leaves, 1½ foot long, terete and slender, dry off in winter. This species will be found quite hardy if

planted under an overhanging boulder in the rock-garden, where it would be kept in a fairly dry state in the winter.

Z. carinata resembles *Z. brachyandra*, and possesses a deep rose-coloured band on the inside of each segment. It is a somewhat difficult subject, the bulbs becoming smaller from no apparent cause. Some fine flowers of this species were produced in the succulent-house at Kew a few weeks back from plants in a border alongside of the walk, where I should think the soil would be somewhat moist; the fact seems to point out that it does not want so much "toasting" as is usually given it.

Z. rosea.—The small species usually seen has flowers not more than 4 inches high, deep rose in colour, about 1 to 1½ inch across. It is useful for a small border in the greenhouse, or for cultivation in flower-pots. *Geo. B. Mallett.*

(To be continued.)

VICTORIA PARK, TIPTON.

(SEE FIG. 25, P. 99.)

A NEW public park of 33 acres extent is about to be laid out at Tipton, Staffordshire. A competition has just taken place for prizes offered for the best adjudged plans for laying-out the area, and the first prize, of £25, has been awarded to Messrs. W. Barron & Son, of the Elvaston Nurseries. Mr. J. Perry, an architect of Tipton, was 2nd; and there were eight others. Messrs. Barron's plan provides for a lake of about 3 acres, also cricket-stand, recreation-grounds, bowling-green, band-stand, shelters, &c. They also furnished plans for lodge, entrance-gates, &c. Unfortunately, the colliery district of Tipton is by no means a favourable one for gardening, and considerable care, we suspect, will be necessary in the selection of trees and shrubs for planting.

SEED TRADE.

PEAS AT MESSRS. HURST & SONS.—I have recently enjoyed the advantage of looking through some 700 growing samples of Peas at Messrs. Hurst & Sons' seed-trial grounds at Kelvedon, in Essex. A more reliable trial can scarcely be imagined, because the soil, like that of the greater part of the Kelvedon district, is well fitted for the growth of vegetable crops, and particularly for Peas and Beans. The spot is an open and breezy one, with no trees near to draw goodness from the soil, or cast shadows across the trial rows. The season, if a little retarding, has been on the whole favourable to the development of the plants, and though there was a dryness in the soil, the good holding qualities and careful cultivation of the land had fully developed the character of the samples under proof.

I must not be understood as being desirous of suggesting there were 700 sorts. In a firm of such large business connections as Messrs. Hurst & Sons, the same variety of a Pea will come into the warehouse from different sources, and in varying quantities. A sample of each bulk is taken, recorded in a book, and sown—a certain length of line of each. It may thus happen there are twenty rows of a popular variety like *William 1st*, all side by side for complete comparison. The time of sowing, the colour of the seed, the particular bulk from which the sample is taken, the time of flowering, the height, the time of podding, and the general characteristics necessary to be noted, are all recorded. The carrying out of such a trial is a work of immense labour; constant attention and examination are necessary; comparisons are made, and results duly noted. This is all done by Mr. A. Newby, the superintendent of the seed trial grounds, whose knowledge of Peas must be very great. The quality of every bulk is thus ascertained. The seeds of all the best and truest samples are carefully saved for stock purposes, and in this way our leading wholesale seed houses, who have many hundreds of quarters of Peas passing through their hands, are thus enabled to keep their stocks true and pure. The seeds of one of these rows is sown again next year; it is subjected to rigid selection, and enough is thereby obtained to sow a

new acres. This rigid selection is all the more necessary, as some sorts of Peas are prone to revert to inferior types. William 1st and Stratagem may be mentioned as cases in point.

Of the early white round Peas, of which enormous quantities are grown for garden and market purposes, Improved Sangster's No. 1 is clearly the best. It is known by several names—First-and-Best, Caracacus, Dandy, Rural New Yorker, &c.; it was even in character, early, cropping well, and excellent as a first early sort, hardy in character, and moderate in price. In height it is about 2½ feet, but near it were samples of Sangster's No. 1, 4 feet in height, small podded, and generally poor.

William 1st is a round blue indented Pea, an elementary form of the wrinkled, but with a fatal tendency to deterioration. It appears to be in the nature of the variety, as if it possessed an angular

but it is grown largely in France. Blue Peter may be regarded as the blue round form of Beck's Gem, but is a little later in podding. First Crop Blue is yet a little later than Blue Peter, a trifle taller, and produces larger pods. Pride of the Market, also a blue round Pea, is the twin of Stratagem, the latter being its wrinkled form. It is a very hardy variety, and can thus be sown in autumn; it is very largely grown for market in this country. Bishop's Longpod, an old variety, which has been in cultivation for some half century. It is about 2 feet in height, a second early, very hardy, and cheap in price; it is also in great demand in France, where small Peas find greater favour than large ones. Harrison's Glory, another old variety, is a second early round blue, and a good succession to Eclipse, being a free bearer; it is grown very largely in the east of England for selling in a dry state for boiling.

duces large, well-filled pods. There is a great future before this variety as a market Pea. Ameer is in the same way, but has green round seed; it is an early type of Supreme, bearing large broad handsome pods—it is also of fine table quality.

Prizetaker, an old variety, is now superseded by Telegraph, and the former is very apt to run back to an inferior form. The latter, which is a round form of the popular Telephone, is a fine market Pea, superior to Prizetaker in all respects, and produces long, handsome, well-filled green pods. A very fine and true stock of Telegraph could be seen at Kelvedon, but it is also very apt to run back.

A very useful second early blue round is found in Lye's Favourite; it grows to the height of 4½ feet, and is an excellent cropper, producing long, white, slightly-curved pods, with ten and eleven Peas in a pod.

FIG. 25.—VICTORIA PARK, TIPTON. (SEE P. 98.)

moral nature. The finest stock, known as William 1st Extra Selected, is 3 feet in height, and very uniform. It is quite early, and is better flavoured when cooked than the ordinary white round varieties. William the Conqueror has also blue round slightly indented seed; it is from 3½ to 4 feet in height, with long, full, green pods, in which as many as ten Peas can be counted—an excellent market variety. Harrison's Eclipse may be taken as the best representative of the early round blue Peas, and it includes several synonyms, Earliest of All being the best known. Universal experience attests to the fact that blue round Peas are better flavoured than white ones, and Eclipse has well filled green pods. It is a variety in large demand for market purposes.

Beck's Gem is one of the oldest of the early dwarf white round Peas, almost as early as Improved Sangster's No. 1, and about a foot in height, though not in great demand in this country, being superseded by William Hurst, Chelsea Gem, and others;

Gladiator (Laxton) is a Pea grown very largely in this country and in France for market purposes; it is generally recognised as a great improvement upon Fillbasket, having larger pods, while it is a good cropper. Bedman's Imperial is another green round, the seed larger than that of Glory, it has rather shorter pods, but they are broader. It also is largely grown as a boiler in a dry state; it is tenderer and better flavoured.

Princess Royal, a rather large, white, round Pea, and which is regarded as a dwarf form of the Victoria Marrow, as well as being earlier in bearing, was one of the first fruits of Dr. Maclean's efforts at cross-fertilisation, sent out by Mr. Turner, and has been in cultivation over forty years. It is largely grown by the French, who appear to regard it as a large-seeded Bishop's Longpod.

Of the newer Early White Round Peas, Sutton's Bountiful takes high rank; at Kelvedon it was three days earlier than Improved Sangster's, and pro-

What a singular-looking Pea is the Reverse Podded Sabre! It is an inversion of things natural in Peas; instead of the point of the pod curving to its under side, it bends back the other way. It is a curiosity in this country, but it is in demand in France; it grows to height of 4½ feet. The old Victoria Marrow, known also as Thurstan's Reliance, is rapidly going out of cultivation in this country, but it is in demand in France.

Of the dwarf-wrinkled Peas, William Hurst needs no recommendation; it is dwarf, and a free cropper. Another variety is Sutton's Seedling Marrowfat, about the same height, but perhaps three days later in being fit to gather. Chelsea Gem is simply a white wrinkled selection from William Hurst, and a little stronger grower. William Hurst is rapidly taking the place of American Wonder, which is going out of cultivation. English Wonder is a small, short, tight-podded dwarf Pea, not quite so early as William Hurst. Sutton's Harbinger is both very dwarf in

growth and early to crop; it is about the same height as William Hurst, producing remarkably large Peas in short pods; it appears to be a model variety for growing in pots for an early crop. Improved English Wonder has pods double the size of those of the type, and it is a very free bearer; a capital sort for small gardens where space is limited.

Gradus is perhaps one of the very finest of the early wrinkled Marrows, as early as William 1st, 3 feet in height, and bears freely very handsome dark-green pods; it can be classed as a distinct variety. Sutton's May Queen, Early Giant, and A1, are all early wrinkled varieties: May Queen is the dwarfest and earliest, being four days before the Giant; A1 has rather the largest-sized pods—they are excellent garden varieties, but the pale pods, of May Queen especially, discounts somewhat their value for market purposes. Dr. Hogg, also 3 feet in height, can be classed with the early Marrowfats, it is a great cropper, and produces large well-filled pods; it is an excellent garden Pea, but does not appear to be so much grown as its merits deserve. Webb's Senator is in the same way, 2½ feet, crops well, with light curved pods.

Daisy Pea (I think one of Carter's introductions) may be regarded as a pale-podded Stratagem, bears well, pods large and well filled, an excellent garden variety. Like its relative, Stratagem, it needs to be closely selected. Yorkshire Hero is probably the best of the Maincrop wrinkled Peas for market purposes, and more of it is sold to market gardeners than any other wrinkled variety.

An original stock of Veitch's Perfection was very fine. The old and favourite variety is known under a whole host of synonyms, and when in its best form holds its own against many new introductions. The stock of it at Kelvedon was remarkably good. Triumph, which appeared to be identical with John Bull, is very largely grown by market gardeners in the London district; it bears handsome, pointed pods. Dr. Maclean bears fine pods, but it is a variety apt to take the mildew. Webb's Pioneer greatly resembles Gradus. Sharpe's Queen is of the Stratagem type, but taller and later; it also is subject to mildew. Omega is one of the most useful of the late wrinkled Peas.

Duke of York is of the character of Duke of Albany, dwarfed, producing very fine green pods. Autocrat is, perhaps, the finest late Pea, distinct, valuable, producing fine pods of the Ne Plus Ultra type; but Cuttle, which is the result of a distinct cross, is an improved Autocrat, with a bigger pod, very fine, and having strength of constitution, resists blight well. The Gladstone, like the preceding—a new variety, and growing to the same height, 3½ feet—is remarkable for the number of Peas it produces in a pod, averaging eleven; it is a very fine late variety, and may be regarded as an improved St. Duthus. Prince of Wales, 3 feet in height, and by no means new, is a general favourite all over the country, both for produce and quality; the stock of this is very fine. Walkers' Perpetual is a white-seeded Veitch's Perfection. Empress of India is like a green form of Bountiful.

Between Eckford's Essential and the new Pea Thomas Laxton, which recently received an Award of Merit at Chiswick, we could not detect any difference. They were growing side by side at Kelvedon under the same conditions, and the difference difficult to detect.

Two new varieties shortly to be offered by Messrs. Hurst & Son appear destined to make their mark. One is Hurst's Conquest, 4½ feet, which produces large, pale, blunt pods in pairs; they are long and well filled. It is a blue, wrinkled Pea, and likely to become a very popular garden variety. The other is Hurst's Incomparable, 4 feet, a white wrinkled marrow, with large, well-filled pale pods, rather more pointed than the preceding. It also promises to be a very fine garden variety.

Hurst's Reliance, which has only recently been distributed, is of the early Ne Plus Ultra type, but not so tall in growth; it produces well-filled, large-sized blunt pods. That popular variety, Telephone, was seen here in its finest character; it is grown

very largely in the Channel Islands for an early crop. Duke of Albany was also remarkably good. It must be said of the once favourite Champion of England that it is fast dying out. Forty-fold is a blunt-podded type of it.

Of the very tall Peas, Tall Green Mammoth, with its large pods, is still a popular tall variety much in demand. British Queen is still much called for; large quantities go to France. Very fine stocks of Ne Plus Ultra were also here, still a grand, tall, late Pea, though probably less grown in gardens than formerly. Old varieties are still required in various parts of the country, and a supply has to be provided.

Growing by itself was a breadth of Pierremont Gem, which was distributed by Messrs. Kent & Brydon, of Darlington. It is a dwarf-growing variety, and for its height—not more than 1½ foot—produces very large pods, while it is a rare cropper.

It may be asked, "Is it necessary to retain so many varieties, to say nothing about names?" I have just counted 112 names in the catalogue of a leading wholesale seed-house. Some of these are merely synonyms, but as the same variety is asked for under different names in various parts of the country, they must be published in a list. No persons would welcome a reduction of the varieties of Peas so eagerly at the wholesale seed-men; but they are practically powerless. So long as varieties are asked for, they must, in the interest of business, be supplied. New varieties which are improvements upon old ones find their way very slowly into some parts of the country. That some weeding-out is highly necessary, but who will take the initiative? If the task is ever undertaken by the Royal Horticultural Society, it should be by means of a comprehensive trial made right in the open breezy country, and in suitable soil; but any committee competent to deal fully with the matter should be largely recruited from the wholesale seed trade. *R. Dean.*

SYRINGA, OR LILAC.

Much advance has been made in recent years in the case of this genus of hardy shrubs, owing, in a great measure, to the industry and skill of MM. Lemoine, of Nancy, and some few other French nurserymen; and not only in colour of the flower are improvements noticeable, but in fragrance. In double-flowered Lilacs, the doubling is greater and the clusters larger than those of the older varieties. Among single-flowered varieties, the following are excellent, viz., Souvenir de Louis Späth, the finest of the single-flowered, dark-bluish lilac, large handsome trusses, and the darkest in colour yet raised. Madame Kreuter is another fine variety, with bright reddish-lilac flowers, a distinct colour, and the rip a very handsome one. Duchess of Orleans is a fine pale blue flower, and valuable for its lateness. Philémon has a fine truss of very dark bluish-lilac flowers, and it is distinct in habit, and very free to flower. Alba grandiflora and Madame Legraye are both good pure white varieties of dwarf habit, and equally adapted for forcing. Among double-flowered varieties, with good fragrance, there are of the newest and best:—Alphonse Lavallée, a grand variety, with blue flowers, shaded violet, perfectly double, and the truss very fine; Charles Baltet, very free-flowering variety, with lilac-coloured flowers, shading to rosy-mauve; Le Gaulois, deep scarlet flowers in large trusses, perfectly double—distinct and handsome in appearance; Léon Simon, a beautiful variety, having bluish-crimson flowers, the buds being coral-red before expanding; Madame Abel Chateau is a new variety, with pure milk-white flowers, perfectly double, and borne on immense trusses; Madame Casimir Perrier, which in my opinion is the prettiest of all the doubles, of a creamy-white; Madame Fernande Viger has immense trusses, often 1 foot in length, of white flowers, delicately scented; Madame Lemcine, a grand white-flowered variety, perfectly double and fragrant, resembling in miniature a double-flowered Bouvardia; President Grey, a pretty variety, bearing good sized trusses of cobalt-blue flowers, with a distinct rosy edge; President Carnot is in colour pale lilac, shading to white, and

it is both pretty and distinct; Senator Volland exhibits large trusses of rosy-red flowers, and is one of the most brilliant of all the double-flowered forms. Lilacs grow well in almost any garden soil, and are readily increased by means of root-suckers; while in the case of select varieties, they are easily increased by grafting on the common Lilac in March, and also by cuttings in the autumn. *E. S., Woking.*

COLONIAL NOTES.

TRINIDAD.

THE annual report for the year 1897 is a very satisfactory document, showing evidence of energy and judgment on almost every page. The subjects treated of are very numerous and varied; some have reference merely to ornamental plants, others to those of economic importance. In the case of Sugar, the object of the experiments in progress is to secure canes which will produce a larger proportion of saccharine matter, so that with no increased expenditure of labour or machinery, a more profitable product may be obtained. The raising of seedlings, a comparatively new process, gives hopes that some such variety may be found. A lithographic illustration of some of these seedlings is issued with the Report. Cacao also receives much attention at the hands of the Director. It appears that the manufacturer is specially desirous of obtaining produce of uniform quality, and that to secure that, he mixes or blends the produce of one island with that of another.

The *Coffea stenophylla* grows freely, but it is not so robust as the Liberian Coffee. Its produce, reports the Director, is of a quality to take its place at once upon the markets as a first-class Coffee of the Mocha type.

As in other tropical gardens, much attention is paid to rubber-producing plants. India-rubber is the produce of *Ficus elastica*; Para-rubber of *Hevea brasiliensis*; Ceara-rubber of *Manihot Glaziovii*; Demara-rubber of *Hevea Sprucei* and *H. pauciflora*; African-rubber of *Kicksia africana* and *Tabernaemontana crassa*; West African rubber of a species of *Landolphia*; Central American rubber of *Castilleja elastica*, trees and climbers of different natural orders, but all furnishing latex. *Castilleja elastica*, a tree, is the one most suitable for culture in Trinidad, and great hopes are entertained from it.

In future it appears the decorative gardens will be separated from the economic department. Government-house will be the centre of the ornamental gardens; whilst the trial grounds, experiment, and botanical stations will be gradually established at St. Clair.

The average rainfall at the present garden is put down at 65.9 inches, of which the larger portion falls in August. The driest month is February. The mean annual temperature is 79.1.

HATFIELD.

On the occasion of the Garden party given by the Marquis of Salisbury on Saturday, July 23, Hatfield looked its best this year. The trees wore their greenest livery; the turf was just of that tint which pleases the gardener best, but is rarely seen at the end of the month of July, unless the skies have been more than ordinarily propitious, or a system of water-mains exists to supplement or take the place of a natural supply; and, lastly, the two herbaceous perennial gardens, the present glories of the place, were in the finest condition. We do not remember to have observed anywhere else such an abundance of strong masses of *Delphinium*, *Lychnis coronaria*, *Mona-da didyma*, *Chrysanthemum maximum*, of the white-flowered *Lavatera*, *Oenothera Lamarckiana*, Sweet Peas, and of Roses, especially *Crimson Rambler*, and old-fashioned Roses, such as the *Ayrshire Rambler*, *Ruga*, *Souvenir de la Malmaison*, *Baron Prevost*, *Félicité-Perpétue*, *Devoniensis*, &c.

Everything herbaceous was in large quantity, and much repetition in the matter of varieties had evidently not disturbed the mind of the planter, Mr.

Norman, his Lordship's gardener, is a believer in good spademan'ship and the virtues of manure, and it is to deep trenching and heavy manuring that his successes with the foregoing are mainly due. There is that about Hatfield which reminds one of the stiff primness of other days: the rectangularity of the enclosures about the mansion, the covered promenades of clipped Limes at least 250 years old, the terra-cotta balustrades and steps and pillars to the several terraces, the maze (newly planted, and not yet grown up to be a maze in actuality), the avenues of old trees and arboreal survivals (as, for instance, the two Mulberry trees, said to have been planted by James I.); and all these things charm one more than the finest and newest production of to-day. The old style of bedding-out is quite given up, and "mixed" bedding has taken its place, and generally to the advantage of the latter. We may here instance a few types of the latter, arranged as are all the beds on turf. *Crocus aurea* and *Francoa ramosa*, with *Viola Bullion* as the groundwork; *Crocus* mixed with a white flowered *Antirrhinum*, and the same *Viola* as an edging. In the garden to the south of

Hamburgh. Mr. Norman avoids having split berries in Madresfield Court by following out rigidly the methods he advises in his Calendar—viz., ventilation at all times, and the use of artificial heat at the critical period. We were shown a Royal George Peach-tree in a forcing-house, which annually carries from 300 to 400 fruits. This part of Hatfield gardens is mainly devoted to supplying the needs of the large establishments here, in London, and elsewhere; and everything is made to subserve this end, for there are no nicely-kept gravel walks or edgings of any kind in the dozen acres of kitchen garden, no labour wasted on mere appearances, but everything seems to be well cultivated, as it needs must where so much good produce of every kind is required.

Capital fruit-trees cover the walls, and even in this not over-abundant fruit year these trees generally are well cropped. In the plant-houses the same wholesale market-garden methods hold good, and great stocks of plants of *Adiantum Farleyense*, *Calanthe Veitchii*, *Roses*, *Souvenir de la Malmaison* and *Uriah Pike* Carnations, and Palms of large and small sizes for house decoration, were noted.

wrote that if I could find time to run down I could see nearly all his hybrids in flower, I lost no time in responding, and soon after midday I was in the saddle, and speeding along the cyclist's favourite Bath Road, en route for Woodside, Farnham Royal. On arrival I was soon introduced to the objects of my visit, and a most interesting lot they were.

First must be mentioned plants of the true wild *Senecio cruentus*, with small, light purple flowers, and of the shrubby *S. Heritieri*, with much larger white flowers, tipped with rosy-purple on the ray florets, small leaves, and densely tomentose white stems. Mr. James's first experiment was to cross *S. cruentus* with the pollen of *S. Heritieri*, and the result was five seedling plants, which flowered a year ago. Two of these had been kept, and were then flowering well. They are unmistakable hybrids, presenting the usual intermediate character. They are more shrubby than *cruentus*, and are plentifully covered with tomentum on the stems and undersides of the leaves. The first is much like *Heritieri* in the size and details of the leaves and stems, and the flowers are white, and most like *cruentus* in shape, but twice as large. The second has much larger leaves, tinged with purple underneath, purple stems, and slightly larger brilliant crimson-purple flowers, thus showing more of the *cruentus* character. The other three plants are now lost, but Mr. James remembers that one had pale-pink flowers, another white flowers tipped with pink, and the third, white flowers tipped with blue, and that they were true hybrids, like the preceding in general character.

These five primary hybrids on flowering were intercrossed together, by transferring the pollen in various ways, and the result was the large batch of plants now in flower, which almost fill one house, and show the most bewildering range of variation, though in general character they agree with the original hybrids from which they sprang. In fact, they may be termed hybrids perpetuated from seed, for the intercrossing was only between themselves, not with any other kind.

As this large batch of seedlings began to show their character they were divided into groups, those most resembling *cruentus* in habit and foliage being placed at one end of the house, and those most like *Heritieri* at the other end, the former group being slightly the larger of the two. And this grouping by habit afterwards proved to agree pretty well with the character of the flowers, for those with the *cruentus* habit had generally more numerous smaller flowers than the other, though as regards colour many variations in one group could be matched in the other, or nearly so. The tipped forms, however, were rather more numerous in the *Heritieri*-like group, and the selfs in the other. It was most interesting to see this wide range of variation, and the following were noted as the more typical forms, though they were more or less connected by various intermediates.

In the "cruentus-like" group were pure white, light blush, rose-pink, rose-purple, deep purple, and bright carmine-crimson selfs, and forms tipped with pink and slate-blue of different shades and widths, but all had a compact inflorescence of numerous rather small flowers. The "Heritieri-like" group contained pure white and bright rose-purple selfs, and a large series of tipped flowers, the colours ranging through lavender, slate-blue, pale pink, rose-pink, to bright rose-purple, and the breadth of the ring of colour varied from the merest touch at the apex of the ray florets to those in which the white was reduced to a narrow ring at the base. Most of these had a less compact inflorescence of larger, more stellate flowers, than those of the other group. Two or three of the seedlings very closely resembled *S. Heritieri* in habit, and one could scarcely be distinguished by vegetative characters, yet the just opening flowers showed strongly their hybrid origin.

And now one may ask, what light this interesting experiment throws on the vexed question of the origin of the garden Cineraria, in which connection we may recall the plant described by Willdenow in 1809 as *Cineraria hybrida* (*Enum. Pl. Hort. Berol.*, p. 893), which he said was cultivated in gardens under the name of *C. cruenta*, but was abundantly different,

FIG. 26.—AZALEA INDICA, IN THE GARDEN AT CLYNE CASTLE, S. WALES.

the mansion Fuchsias as standards are used—viz., *Defiance*, *Madame Cornellissen*, *Lye's Own*, and *Mrs. Rundle*, *Swainsonia galegifolia* being dotted between, and dwarf Fuchsias with yellow leaves form the groundwork. Scarlet-flowered *Nasturtiums*, both climbing and bush, are dotted here and there, the climbers being attached to the bare stems of the Fuchsias. It will doubtless work out satisfactorily, but it struck us that the plants were not sufficiently forwarded, and the season would be past before the best effect was obtained. This style, with many variations in the plants employed, obtains generally in the gardens; and it is interesting, but not at a distance effective, owing to the lack of colour—that very essential material in every picture that is not black on white.

The keeping of the gardens and pleasure-grounds about the mansion is admirable, and shrubs and trees appear to receive great attention, although rare species are not often met with. The vineries, plant-house, and kitchen gardens are remote from the house. The vineries number seven, and the Vines of all kinds seemed to be in capital health; and they certainly carried very fair crops of bunches, either well finished or finishing up. The varieties grown include *Gros Colman*, *Madresfield Court*, *Lady Downe's seedling*, *Alexandrian Muscat*, *Foster's seedling*, and *Black*

AZALEA INDICA AT CLYNE CASTLE.

MR. MILNER, in his notice of the *Azalea indica* growing out-of-doors at this place made a mistake which was evidently the result of a misunderstanding on his part. It is that the Azaleas are never protected in the winter. Some of them are not protected, and last year not any of them were covered, and I am sure that they are the better for it. But our usual mode of procedure is this:—About the middle of November we place a light framework of rods over them, held up by short forked props. If the weather becomes very severe, we scatter a quantity of Bracken over the rods. The illustration (fig. 26) shows our largest plant of *Azalea indica alba*, which is 12 feet in diameter, and nearly 6 feet in height, and is one of the plants not protected. *T. Foote, Clyne Castle Gardens.*

HYBRID CINERARIAS.

IF we cannot at the present day trace the successive steps by which the florist's Cineraria has been evolved—at all events during the early stages of its history—the circumstance gives an additional interest to the attempts now being made to demonstrate it experimentally, and when the other day Mr. James

having flowers nearly as in *C. lanata* (another name for *Heritieri*). The only suggestion as to its origin is contained in the name, but it is evident that Willdenow thought the plant to be a hybrid between the two species in question, and I believe that he was right, and that Mr. James has now raised the same plant. Both species were in cultivation at this time, and the pollen would readily be carried about by bees, who are fond of these plants—in fact, about a dozen were busily at work in Mr. James's house when I was there. And the hybrids once raised would certainly be preserved, for they are such a great improvement horticulturally on the wild *cruentus*, that one can easily imagine how the improved race would sooner or later displace the other.

In the case of Mr. James's hybrids, a possible objection may be urged, namely, that all possibility of crossing with the garden *Cineraria* was not eliminated, especially as bees are so fond of the flowers; but for several reasons I think it has no practical force, and in any case it cannot apply to Willdenow's plant, when the improved garden *Cineraria* was not in existence. In the first place, the reversed hybrid has been raised at Kew, a plant of *S. Heritieri* having been placed under a fine gauze net, and carefully crossed with pollen from the wild *cruentus*, and the result was a hybrid having the essential characters of those raised by Mr. James, in fact, less different than many of those were from each other. Indeed, it might have been almost, if not quite, matched among those with tipped flowers. Again, both *Heritieri* and *cruentus* were crossed at Kew with the garden *Cineraria*, and, as would be expected, the hybrids in each case have far larger flowers than those raised by Mr. James. This evidence is sufficiently conclusive, and it should further be mentioned that Mr. James had this batch of hybrids in a house a considerable distance away from those in which his strain of the garden *Cinerarias* are grown. In fact, all the evidence goes to show that these hybrids were derived solely from the two species in question.

It is interesting to have reproduced the long-lost *Cineraria hybrida*, or *Senecio hybridus*, as I believe that Mr. James has done, and while, from a decorative standpoint, it marks a great advance on the wild *cruentus*, there is yet an enormous gap between it and the garden *Cineraria* of to-day, and this gap, or the rather wider one which separates the latter from the wild *cruentus*, has been filled by a long process of selection, and the successive steps illustrate the great principle of evolution in actual progress.

How far these facts throw light on the origin of the garden *Cineraria* may be left for individual opinion, and it is admitted that the latter shows no trace of the shrubby habit of *S. Heritieri*. This point, however, may be misleading, for in practice the garden *Cineraria* has been made an annual, and that would tend to eliminate the shrubby character; and in this again the principle of evolution is seen at work. It is in the flowers that the resemblance to *Heritieri* is chiefly found, and this is precisely what might have been expected. It seems to me highly probable that a race of plants with shrubby habit and improved flowers might be derived from these hybrids if selection were carried out in that direction, and this process would tend to eliminate the *cruentus*-like character from the vegetative organs. I believe it is this object, rather than that of reconstructing the garden *Cineraria*, that Mr. James has in view. Lastly, it may be remarked that Mr. James has the true *Senecio populifolius* in cultivation, and some hybrid seedlings between it and *S. cruentus*, which were not yet in flower. There were also the true *Senecio tussilaginis* with brilliant rose-purple flowers, and the yellow *Cineraria lobata*, the latter being the only true *Cineraria* in the group, as the rest technically belong to *Senecio*. R. A. R.

STRAWBERRY CULTURE IN FRANCE.

THE Strawberry ranks amongst the most highly-prized fruits in France. It has attained its present pre-eminence, thanks to the ease with which crossing varieties can be done by an intelligent horticulturist, and although the varieties are legion, they are only modifications of half-a-dozen specific types. Cultivation has not only singularly prolonged the duration of the period of its flowering, but also the size and the quality of the fruit. The Strawberry in France is divided into two well-recognised classes—the small or the *quatre-saisons*, and the large or the *grosses fraises*. These differ, not only in appearances and qualities, but in mode

of raising and of culture. The small Strawberry is produced from seed, the large varieties from the stolons or runners of varieties raised from *F. virginiana* and from *F. chiloensis*. Strange, that although the wild plant is indigenous to Greece, the classical authors make no notice of it. Pliny and Virgil only allude to it nominally. The *quatre-saisons* Strawberry keeps growers on the alert to produce a fruit at once large, of a tapering shape, and of a deep red colour. To obtain the seed from which it is invariably raised, fruits are selected when perfectly ripe that present the required points of excellence, are crushed with care, and the seeds separated from the pulp; these are washed, and the pulp strained through a cloth. The seed is then collected and dried in an airy and shady spot. This seed can be sown in the open air in May and June on a specially prepared plot of ground, but the plants are not so good as those resulting from seed sown at the end of the month of March or early in April on a hot-bed. The seed should be covered thinly with leaf-mould, and when the plants come through, air should be admitted gradually. When the plants possess a few leaves, they should be dibbled-out in September in tufts of two together, 6 inches apart, and from 12 to 20 inches asunder, on the permanent bed, for which the soil ought to be sandy and fresh, and the spaces between the plants covered with a mulch of short manure. Some cultivators make a new bed in another place, but do not afford fresh soil. Following the period of planting, the Strawberry plants will commence bearing in the second spring or autumn. It is well to dibble out the plants from the main stools at a distance of 2 feet apart every two or three years, or the plants will quickly degenerate. Avoid employing mould from an old Mushroom-bed, as it tends to redden the leaves, and in the end kills the plants. The subsequent culture is very light and easy; water is frequently and moderately afforded during the fruiting period, and the beds freed from weeds, removing useless runners and decayed leaves.

Strawberries are procurable so early in the spring, that forcing the plants is regarded as rather an ornamental than a commercial matter. The plants for forcing are those of the large-fruited varieties, and these are grown in pots filled with good loam. A rich, friable soil, consisting of silicious sand, clay, oxide of iron, and carbonate of lime, is most favourable to the cultivation of the Strawberry. The pots should be brought under cover in October and in December; forcing commences at 55° Fahr., gradually rising to 75°. In most respects the methods employed resemble those pursued here. The varieties of Strawberries to grow are as numerous as the gardeners please to make them. The varieties which have no runners, such as the *Gaillon*, is naturally good for out-of-doors culture. As a rule, in France at least, the white Strawberries are not prized. The English types have exercised a great influence upon those of France, such as the *British Queen*, *Keen's Seedling*, and *Deptford Pine*. For forcing, *Docteur Morère* is in great request, its fruit is large, rose-coloured, perfumed, and sugary; *May Queen* is precocious and prolific, the colour is deep red, and the quality good; the *Margaret Lebreton* suits all lands, is of a remarkable precocity and fertile; *Victoria* is a good variety that suits poor soils, is perfumed, juicy, yields well, and exacts no special care. All the large-fruited varieties are descendants from *F. virginiana*, a native of the United States, and *F. chiloensis*, from the Chilean Archipelago.

The earliest open-air crop of Strawberries comes from Carpentras, in the département of the *Vaucluse*, about the last week of April, the supply continuing till the middle of June; the commencing price is 3 to 5 francs the kilogramme; then 60 to 80 francs the double hundredweight, ultimately falling in price as the season advances to 20 francs. An acre of beds can produce 1½ ton to 5 tons of fruit; the profit per acre, after deducting all expenses, varies from 400 to 1,200 francs. In some districts Strawberries are raised in rows between the Vines.

In the *Vaucluse* mineral manures have been tried on Strawberries, on the proposition of the Minister of Agriculture. The result has not realised expectations so far. Nitrate of potash, in small doses, stimulated the plant too much, and destroyed the beauty of the fruit. In the valley of the *Durance*, and the region traversed by the *Carpentras Canal*—once a waste and arid region—the finest Strawberries for the Paris market are now produced. The average price of Strawberries at the central wholesale markets of the city, is from 1 franc 65 centimes to 4 francs per basket of 6½ lbs. It is Carpentras that supplies the

large, and *Hyères* the smaller and more esteemed varieties. During the full tide of the season the costermongers sell the fruit at 2 sous, or one penny per lb. *Fresenius*, in 1857, and *Buignet* in 1859, analysed the Strawberry. The latter chemist dealt with fourteen varieties, and chiefly those appertaining to the wood or Alpine family; they were found all rich in malic acid and sugar. In France the fruit is eaten with red or white wine, sugar, rum, *kirschwasser*, orange-juice, or sugared water. Strawberries smothered in cream are not patronised, being viewed as indigestible. The same objection is made against the white Strawberry, unless it be mixed with the small "*quatre-saisons*" variety.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Peaches.—Trees on which late crops of fruit are swelling require an abundant supply of water at the roots. The fruit is largely composed of water, the accumulation of which is very rapid between the stoning and the ripening period, so that the size and quality of the fruit depends on the supply of water and nourishment at the roots. Add manure to the water at alternate waterings. When the weather is bright, syringe thoroughly twice a day, so as to have the trees as free from red spider as possible when the fruit begins to ripen, at which time syringing must be discontinued. Tie to the trellis shoots that require so doing, and stop those that have grown to their allotted distance. To give colour, expose swelling fruit to the sun as much as possible, by putting the leaves on one side, and taking one or two off where they shade the fruit. Pinch laterals to two leaves. Should Thrips be present, fumigate with XL compound. When the fruit begins to ripen, fix a net under the trees at such a distance that when the fruits fall into it they may not get bruised. Fruits that are at the extreme parts of the tree, and which would not fall into the net, should be prevented from falling to the ground by having pieces of net placed round them loosely, so as not to bruise them. The temperature for the late Peach-house while the fruits are swelling may be regulated according to the time the fruits are required to be ripe. If they are to be brought on quickly, heat may be employed in the hot-water pipes in dull weather and at night. Otherwise they should be treated in the same manner as crops earlier in the season. Free ventilation is essential to good colouring; they may be retarded by free ventilation by night and day. The most should be made of the top ventilation, not opening the sides when the weather is cold, and thus avoiding a draught. When the fruit is gathered from a tree it should be gone over without delay, in order to remove all weak and surplus wood that is not required for next season. This will permit the wood left in the tree to be ripened better, and will add to the facility for syringing the foliage, so as to keep it clean and healthy to the end of the season. Healthy leaves on well ripened wood in the autumn furnish a good augury for strong, healthy blooms in the following season. In the afternoon of fine days give a thorough washing with the syringe or garden engine, using sufficient force to dislodge red spider without tearing the leaves. Now the fruit is gathered, if the trees have become infested with scale, it may be kept in check by syringing with water that has had soft soap or Gishurst compound dissolved in it at the rate of two ounces to the gallon. Keep the ventilators of the house open, only shutting the top ones against hail. Examine the soil of the border in which they are growing, and when it is approaching a state of dryness give a thorough watering. Peach trees that are growing in pots require strict daily attention in the matter of watering—do not let them suffer for the want of it; their other requirements are the same as for trees growing in borders.

Cherry and Plum Trees.—After the fruits are gathered attend to all their requirements, frequently going over them to pinch back laterals. Give thorough waterings whenever the soil shows sign of dryness; syringe in the afternoon of fine days. Should black-fly appear fumigate, and keep the house cool with free ventilation. Plums that are not ripe, but which are required to be hurried on, may be treated in the same way as Peaches, bearing in mind to force as much as possible with sun heat by shutting early in the afternoon; after syringing if the temperature rises to 90° no harm will occur.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

The Rose Garden.—In localities where little or no rain has fallen for some time, a good soaking of water should be given to the Rose-plants, to maintain them in a healthy condition, and to assist in the development of late flowers. All dead blooms should be removed regularly, to keep a tidy appearance; the soil should be frequently hoed, for the double purpose of destroying weeds and of preventing rapid evaporation. In places where green-fly has reappeared, the plants should be syringed with carbolic soap, as advised in a previous Calendar. Climbing Roses will now be rapidly making long vigorous growths, which should be nailed or tied as the case necessitates.

Violets.—Pay every attention to these at the present time, and onwards throughout their season of growth if satisfactory results are expected during their flowering season. Continued waterings will be needed to keep the plants in a healthy condition, and the syringe should be used freely among the foliage to prevent red-spider. If this pest has already appeared on the plants, they should be syringed with a weak mixture of soft soap and tobacco-water. The under surface of the leaves is the place where the spider will chiefly be found. The surface must be thoroughly wetted with the solution for the destruction of this pest. Keep the plants free from weeds, and stir the surface-soil frequently with the hoe.

General remarks.—Keep the lawns frequently mown and the hedges constantly edged. Pay especial attention to the turf forming croquet and tennis grounds, as these places will be frequently in use at this season of the year. Mow these with the machines twice a week, and roll with a heavy roller after each mowing. Frequent rolling of gravel walks will be necessary to allow of walking in comfort, and where weeds appear they should be hand pulled or destroyed by weed-killers. Remove all weeds by hoeing from shrubberies planted last season. Afford water to any trees or shrubs which are suffering from drought. Creepers on walls, such as Honeysuckles, Clematis, Wistarias, Kerria japonica, and others should have the leading shoots nailed in, and the superfluous ones removed; these will also be greatly benefited by a good soaking of water. Sweet Peas going out of flower should have the dead flowers removed. The best way to prolong the flowering period of Sweet Peas is to constantly cut the flowers, thereby stimulating the growth of the plants and enabling them to produce fresh growths, and consequent prolonging of the flowering period. A good soaking of water and a mulching of half-rotten manure will go a long way towards keeping the plants in a good state of growth, and flowers in abundance may be expected for some time to come. The leaves of the Lime have already begun to fall, and a continued use of the broom will be needed to maintain a neat and tidy appearance, which the garden should present at this period of the year.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Endive.—Early transplanted Endive will at this season require frequent watering. Young Endive plants in seed-beds should also have plenty of water to prevent them becoming stunted or hard in growth before being planted out. Early Endive is best grown on a shady border, and later batches should be grown in a south sheltered position.

Late Carrots.—Sow some seeds now of the early Horn Carrots, choosing a light, free soil. Sow again about the middle of the month. A cold pit, or frame, in which some seeds may be sown at the end of this month, will be found useful in producing tender young Carrots during the winter with but little trouble. Keep the soil free from weeds around the spring-sown crops, and remove any flower-stalks that have been thrown up. During a showery day thin out late sowings.

Turnips.—Run along the rows of late-sown Turnips with a Hawe's watering-pot fitted with a fine rose, in the evening, in order to keep them clean and strengthen them. It will suffice to use clean water.

Parsley.—Thin and weed the late-sown Parsley, and make another sowing on a warm border.

Large Onions.—It will not be necessary to give much more plant-food to this crop, one good soaking of clear water should be given and the bed be left for a time. Remove from the base and around the bulbs any soil that may prevent the bulbs developing. Heavy autumn rains often burst many of the finest bulbs, and also destroy their keeping

qualities. Anything that can be done to encourage early maturity of the bulbs is a gain.

Vegetable-Marrows.—Remove the fruit as soon as fit to cut, and cut off any fruits that may be too old for kitchen use. Give the plants a good watering at the root once every week should the weather be dry.

French Beans and Scarlet Runners.—Pick the pods of French Beans daily, and give water to plants that are coming into bloom. Should the plants flag for want of water, they will not set a good crop. This rule applies also to Scarlet Runner Beans.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

The Fruit-room.—Everything about a fruit-room should be made clean and sweet before the earliest of the fruits have to be placed therein. Thatch makes the best roof, straw and reeds being non-conductors, thus preserving those conditions of equality without which fruit cannot be kept in fine condition, although thick or double wall, or walls lined with hollow bricks, and a tiled roof, with a good loft over the fruit-room, ensures almost the same conditions. The worst of thatch is that it harbours vermin, but a piece of small-meshed wire netting run along the edges of the thatch and turned up for a foot on either side will do much to prevent their ingress; and for stopping holes near doorways and similar places, nothing is so good as sheet zinc, if it can be properly fastened. Strong-smelling substances, such as tar, paint, &c., should not be used inside a fruit-room, or the flavour of the fruits may be affected thereby; and for the same reason, the shelves and drawers should not be made of coniferous wood. All shelves in fruit-rooms ought to be perfectly smooth, and formed of boards, ribbed bottoms or those formed of slats causing indentations in the rind of the fruit, and ultimately decay. It is a good plan to have portable frames made to fit windows and doorways, and to cover these with $\frac{1}{2}$ -inch mesh wire netting, birds and other vermin are thus easily kept out when the doors and windows are thrown open, which is very necessary after storing has commenced. When all is made thoroughly clean and sound, leave the ventilators open, in order to keep the room cool.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Woolverstone Park, Ipswich.

Tree Carnations.—The earliest plants rooted, which are now fast filling the flower-pots with roots, should be fed with manure-water if they are to be flowered in them; otherwise it will be advisable to afford them a shift into pots of a larger size, as plants root-bound at this date are almost certain to come into flower long before they are wanted. Affording water must be very carefully performed for several weeks after re-potting. Later plants may be placed in 6-inch pots. Carnation Souvenir de la Malmaison, Gloire de Nancy, and others of that strain intended for early flowering in 6-inch pots, should be layered or struck from cuttings, the latter being inserted singly in small pots, placing them under a hand-light in a cool shady position. Layering is the best and surest method of raising a large stock of plants, and in the case of plants growing in pots, they may be planted out in beds to enable the layering to be better carried out. Plants of these varieties in 8-inch pots which are well advanced in growth may be transferred into others 2 inches larger in diameter.

French and Fancy Pelargoniums.—Prune back all the plants that have been well ripened, and stand them in a frame or on their sides against a west wall till buds burst forth; they will need no water till this has occurred. When broken, the soil may be shaken from the roots, the latter cut back a little, and then the plants should be carefully and firmly repotted in a mixture of two-thirds loam, one-third leaf-mould, with a rather free use of silver-sand, affording good drainage, and pots as small as the roots can be got into without undue forcing. Keep these newly-potted plants close till it is seen root-action has taken place, then afford air by degrees, till almost free exposure is allowed. Other plants of these types, or of the decorative and show varieties going out of flower, may be stood in a warm spot out of doors to ripen, and afterwards similarly treated. Plants raised from cuttings struck early, which have had their points pinched out and that are hardened off, may be shifted into 6-inch pots, using a compost of good fibrous loam, a fair portion of rotten manure or leaf mould, with sand in quantity sufficient to keep the soil porous. Let the potting be done firmly, and, as before, keep the plants close for a week or two, and

pinch the shoots when they have made two or three leaves, in order to insure bushy, dwarf plants.

Chrysanthemums.—Plants being cultivated for the production of extra large blooms, will need regular and constant attention from this time onwards till they are housed; and as the earwig has begun to be troublesome, traps must now be set, and these examined nightly twice—just at dusk and again about ten o'clock. Bamboo canes and bean-stalks make good traps if the ends are closed with a bit of cotton wool to prevent the earwigs getting into them during the day. Shoots must be tied in, and manure-water liberally afforded, and occasionally clear soot water. Bushes that are growing freely will stand in need of staking and tying, and in doing this open out the plants in the centre. Keep a sharp outlook for aphids, dusting the points of the shoots with Tobacco-powder immediately the insects are noticed.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Dendrobium infundibulum, and its variety, Jame-sianum, are plants that sometimes fare badly under cultivation owing to the practice of growing them in too high a temperature, whereas the Odontoglossum-house is the proper place for them at this season at any rate; but towards the end of September the cool end of the intermediate-house is more suitable, the plants then completing and ripening their flowering stems. At all times the plants should be kept moist, and especially when in full growth. These two Dendrobiums have made some progress, and the growths are beginning to push forth roots from the base, and if any plant requires repotting or resurfacing with fresh material this is the best season for the operation. Owing to the need of large quantities of water, only small pots should be used, which must be well drained, only a very thin layer of peat and sphagnum-moss being employed in the proportion of two parts of the former to one of the latter, mixing all well together and potting moderately firm.

Epidendrum (Diacrium) bicornutum requires a high temperature, a moist atmosphere, and copious applications of water at the roots whilst growing; and as numerous roots soon push out from the new growths, fresh material should forthwith be afforded to those plants in need of any. Place newly-imported pieces in shallow baskets, in the usual mixture of peat and sphagnum-moss, and large pieces of charcoal, raising the plant well above the rim, and pressing the compost moderately firm about the roots and base. A pseudo-bulb here and there should be tied to the wire of the basket in order to steady the plant. E. nemorale should receive the same treatment. The needs of the majority of the Epidendrams are best afforded in the Cattle or intermediate-houses, choosing a light airy position for them. Owing to the great number of Epidendrams I cannot name more than the following species:—E. prismatocarpum, E. Randii, E. atropurpureum, E. xanthinum, E. radicans, E. crassifolium, E. Schomburgkii, E. O'Brienianum \times , E. arachnoglossum, E. Stamfordianum, E. evectum, E. sceptrum, E. Wallisii, E. hastatum atratum, and E. elegantulum \times , which may all be repotted as soon as growth begins. The material used should consist chiefly of sphagnum-moss, with a few pieces of rough fibry peat, and good drainage must always be provided. Epidendrum radicans is the most brilliant of coloured species, and when it is strongly grown the large paucies of flowers open in succession for a space of three or four months. The plant being of semi-scandent habit, should be trained to some kind of support. The plant throws out aerial roots from the stems, and frequent syringing will conduce to their abundant production, and promote healthy growth. The dwarf-growing E. Endresii—a lovely species—has small pure white flowers, with violet blotches on the lip. It dislikes being suspended near to the roof, and is best suited in a rather damp, shady, position upon the stage. The plant should be well supplied with water at all seasons. As red-spider frequently attacks the undersides of the foliage, it is advisable to take the plants down twice or thrice every week, and hold them head downwards in a pailful of tepid rainwater, carefully wiping the leaves and stems with a soft brush or sponge; for should this pest obtain a strong footing on the plant the leaves soon change colour and fall off, and the plant loses vigour. E. Endresio-Wallisii should be afforded the same kind of treatment. E. myrianthum, E. Cooperianum, E. syringothyrus, E. Frederici Guilielmi, and E. vitellinum majus all do best when subjected to cool-house treatment, a light airy position being beneficial to them at all times.

EDITORIAL NOTICE.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	AUG. 9	Royal Horticultural Society's Committee.
WEDNESDAY,	AUG. 10	Bishop's Stortford Horticultural Society's Show, at The Grange. Wiltshire Horticultural Society's Show, at Salisbury. Hastings and St. Leonard's Horticultural Society's Show.
THURSDAY,	AUG. 11	Taunton Deane Horticultural Society's Show.
FRIDAY,	AUG. 12	Alderley Edge and Wilmslow Horticultural Society's Show, at Alderley Edge (2 days).
SATURDAY,	AUG. 13	Royal Botanic Society, General Meeting.

SALES.

WEDNESDAY,	AUG. 10	Sale of the Osborn Nursery, Sunbury, Middlesex, at the Mart, Tokenhouse Yard, E.C., by Protheroe & Morris.
FRIDAY,	AUG. 12	Imported and Established Orchids at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—62° 8'.

ACTUAL TEMPERATURES:—

LONDON.—August 3 (6 P.M.): Max., 74°; Min., 58°.

PROVINCES.—August 3 (6 P.M.): Max., 84°; Bath; Min., 53°; York.

library and museum, and the Cleghorn Memorial Library followed. Some £197 was collected for the latter, expended in books, and will be found in the *Museum Catalogue*, p. 185.

No notices of motion were put by the members. A hearty vote of thanks to the president concluded the business proper of the general meeting for 1898. Colonel BAILY, however, spoke on the Forest of Dean and the working plan Report of the High Meadow Wood before him, giving a brief address on the importance of time in the growth of timber, and careful skill and culture to secure quantity and quality. We must spread results over periods of twenty-five, forty, or more years. One great merit of timber-growing is "that it also develops other industries, as brush, shoe, clog-making, &c." The smallest bits are turned to profitable use. Supplies should also be regular and constant, or these secondary interests would soon be starved out.

Reviewing the past history of some of the plantations in the Forest of Dean, they had obviously suffered from over-nursing, succeeded by its opposite of extreme thinning. The Larch as a nurse for Oaks was a mistake. The Beech is far better for preserving the strength and moisture of the soil. In fact, some doubt if the best Oak can be grown without the help of Beech. For the future some 3000 acres are to be divided into four working circles. Part under a thirty-five years' rotation, to be succeeded by a twenty-five years' rotation. We have now got beyond the period of crooked Oak for ship-building only, as some sixty years ago, and now need good, solid, straight timber for profit, such as they would, no doubt, see in the Forest of Dean.

Amid the natural disappointment at the silence of the Board of Agriculture, we need not forget that there are already numerous classes and good lecturers on forestry in the Royal Botanic Gardens, and Heriot Watt College, Edinburgh, at which sound practical and theoretical instruction is given. What is now most needed is space and fixity of tenure, to afford object-lessons for proving, testing, and finishing the results of the education given. It is thought that 1500 to 2000 acres might be acquired within easy reach of Edinburgh, partly under wood, to start with, for some £40,000, and thus convert the students into practical foresters, by enabling them to take part in all the processes of timber-growing, from the cultivation of the soil, the sowing and planting of the trees, to the thinning, pruning, felling, and selling of the timber. Considerable areas might also be devoted to the afforesting of waste, or semi-waste land, in the Highlands or elsewhere, of sufficient size to contrast forcibly with the surrounding bareness.

Several points in the controversy are now pretty well established by official and other testimony, as well as by the authority of the press. The first is the unprofitable and wasteful character of our present silvicultural methods. True, most of our adverse critics are foreigners—Frenchmen, Germans, and Danes. But Englishmen and Scotchmen, who have perfected their education in forestry in India or the Colonies, mostly agree with our foreign critics. In fact, the *Daily Scotsman*, an able critic on such matters, with a natural leaning to Scotia's side, in an able article on this subject, allows the adverse judgment to go against us by default. It could hardly do otherwise, as the facts are mostly opposed to any other conclusion; though the *Scotsman* adds, "Yet there is no doubt that if we consent to follow the silvicultural methods which have successfully stood the

test of generations of tree-crops grown across the Channel, and if we make up our minds to keep a portion, at any rate, of our woods stocked with the largest quantity of the most valuable quality of timber they are capable of producing, they will pay just as well as woods pay in France and Germany." The German professors were struck with the remarkable timber-producing qualities of our soil and climate. They attribute it to bad management that our yield of timber is so much less than what it should be, and that the quality is so inferior. So seriously inferior is home-grown timber said to be to foreign, that the use of the former is forbidden under the Land Improvement Acts. The Postmaster-General also has his Red Fir for telegraph-posts from Norway; while miners consume enormous quantities of pit-wood grown in Norway, France, and other countries, in preference to using wood produced almost at the pit's mouth, which they could obtain at half the price.

Having seen some Rannach timber, and a good deal of superb Scotch Fir and other excellent timber grown on such estates as Scone, Dupplin, &c., it is not very easy to allow such sweeping charges of inferiority to go unchallenged. Neither are such fine forests as Fontainebleau, &c., by any means of this same uniform high quality right through. Home timber has lost its market at home as much, probably, for lack of skilful sorting, cutting, and carving for builder's purposes, as for lack of quality. Our foreign trade falls into the builders' hands as a key fits the lock. The saving of labour and time on this side is enormous, and hence nearly all tradesmen prefer foreign timber. A school for the more skilful lumbering of home-grown timber might soon be established, and of course would form an important branch of any national school of forestry.

Two or three more startling facts should quicken improvements on these and other lines. Our foreign timber bill amounts to some eighteen millions a year. For the last eight years it has been rising by leaps and bounds of about two millions sterling per annum. The supplies are visibly shrinking, and cannot be sustained at their present price or volume. Running abreast of this state of things, we have in round numbers four millions of acres of waste land, and some nine million acres more yielding a mere grazing rent; while the existing woodlands are less than a million acres.

The *Scotsman* holds out little hope that any extensive acquisition of waste lands will shortly be effected by the State. Nor is this needful for the object in view. But the State might purchase and maintain a model forest as an object-lesson in economic forestry and experimental research, and a practical training-ground for students. Time, permanency, and security or continuity of tenure, are needed to command success, and these are incompatible with private ownership. Such a forest would not pay its way at first; it would or might certainly do so when in full working order. For it is well known that lands of very poor quality, quite incapable of producing a paying agricultural crop can grow coniferous timber of excellent quality, and there is no doubt that large extensions of wooded areas might be made a very safe and valuable form of investment for their owners. Such extensions would be chiefly in the Highlands, where the planting and culture of new woods would confer great benefit on the rural and resident population. The owners need showing the

State Forestry
for Scotland.

THE letter to the Right Hon. W. H. LONG, President to the Board of Agriculture, that was reprinted

in the *Gardeners' Chronicle*, July 16, is likely to prove an important step towards the establishment of a Scottish School of Forestry. Hence the general meeting of the Society announced for August 2 was looked forward to with a keener interest than usual. There were, however, several reasons for this.

Singularly enough, the very growth of the Society compelled the abandonment of the President's address, when the meeting was held at the Society's Rooms, 5, St. Andrew Square, on August 2. The meeting opened at 10 o'clock, A.M., and as some 80 members had to start early for the Forest of Dean, the business of the meeting had to be curtailed to allow them to get away in time. They would doubtless have gone south all the sooner, and with all the more pleasure, had a favourable answer to the proposed scheme for a school of forestry been forthcoming.

The award of the judges and medals were made to prize essayists: the Spring-growth of Forest-trees, by Mercury; the Planting and Propagation of Trees, by Fir-cones; the Thinning of High Forest Trees for Profit, &c. When the question of State Model Forests for Scotland arose, there was a flutter of expectation for a moment, as if a new departure in State Forestry was about to be made, but it speedily died away as the chairman, Colonel BAILY, made no sign, and the answer was ready from Mr. LONG that he had received the society's application, but added never a word as to the policy or possibility of establishing a Scottish school for forestry in Scotland at a cost of £40,000, and a working cost of £500 a year.

A few words followed on the excursion to the Forest of Dean, to which some eighty members started about twelve o'clock. It was recommended that the excursion in 1899 should assume the character of some five or six day excursions in the neighbourhood of Edinburgh, thus reserving the full strength of the society for the great Paris Exhibition, and the Woods and Forests of France in 1900. A report on the

FIG. 27.—ROSE "EDITH TURNER": PALE FLESH COLOUR. (SEE P. 105.)

way to do it by our foresters, and scientists perhaps by the State, before renewing their ancient privilege and duty of clothing their lands with profitable crops of timber. One of the most disheartening prospects of modern afforestation is the shrinkage of ancient forests, rather than rapid extension and enlargement. On many hill sides and tops traces of ancient forests may be seen, receding into sheer barrenness and sterility. Nor are the causes of such decadence of timber-growing far to seek. Foreign competition or superiority of foreign timber do not fully explain it. Two equally or more potent factors are the over-preservation of game, and the management of woods for profit on æsthetic principles. Both may be more or less desirable on most estates. But either in excess is fatal to the growth of timber for profit. Higher rents for shootings and solid returns for timber are seldom reaped together on the same property.

The West Indies.

IN a former issue we commented on the proposals made by a Commission, which visited the West India Islands with a view to ascertain their financial position, and to determine what steps should be taken to relieve the very serious difficulties under which the islands are labouring. The Commissioners had the advantage of being accompanied by Dr. MORRIS, the Assistant-Director of Kew, who has had great experience in Ceylon, Jamaica, British Honduras, and other British Colonies, and who by his counsel and experience is largely responsible for the improved condition of affairs in Jamaica. Subsequently, as Assistant-Director at Kew, he has had ample opportunity of keeping in touch with the Colonies, and with the important economic departments founded and maintained by Sir WILLIAM and Sir JOSEPH HOOKER, and their successor, Mr. THISTELTON DYER. It is therefore no matter for surprise to read in the debate on the subject in the House of Commons on Tuesday last that the Government has adopted the recommendations of the Commissioners, and proposes to appoint Dr. MORRIS with the title of Imperial Commissioner of Agriculture for the West Indies, as head of a special public department, dealing with all questions of economic botany. Dr. MORRIS' headquarters will be at Barbados.

We extract from the speech of Mr. JOSEPH CHAMBERLAIN, the Secretary of the Colonies, the following remarks, as reported in the *Times* :—

"The obstacles in the way are, in the first place, the ignorance of the population—their technical ignorance of cultivation of this special character—and the lack of communication. The fact is, that the West Indies are separated, one island from the other, and all from the great markets of the world, only being related to them by communications which at the present time are very slow, imperfect, and unsatisfactory. Where tropical produce is concerned, speedy communication is of the first importance. The recommendations of the Commission in this regard were twofold. In the first instance they suggested that a special public department should be established, dealing with all questions of economic plants and botanic stations in all the islands—we propose to adopt that suggestion—and that this establishment should be placed under the direction of Dr. MORRIS, assistant-director at Kew, who is marked out, as I think anyone who knows anything of Kew will admit, by special qualification for an important position of this kind. Not only has he all the scientific and other knowledge in the possession of the authorities at Kew, but also special acquaintance with the West Indies, and if those other industries are to be successful there is no one more

capable of doing it than Dr. MORRIS. Let me express in passing what I think is only due—my deep sense of obligation to the authorities at Kew for the assistance they have given me in regard to the West Indies and other colonies. I believe my predecessors would heartily join me in this recognition of the services at Kew. I do not think it is too much to say that at the present time there are several of our important colonies which owe whatever prosperity they possess to the knowledge and experience and assistance given by the authorities at Kew Gardens. Thousands of letters pass every year between the authorities at Kew and the colonies, and they are able to place at the services of those colonies not only the best advice and experience, but seeds and samples of economic plants capable of cultivation in the colonies."

This tribute to the value of the work at Kew and of the labours of Dr. MORRIS is, as our readers know, amply merited. Still, we cannot read it without a feeling of complacency that the labours of the great botanical department of the country have received this public recognition. It is all the more valuable, because the general public is, for the most part, profoundly ignorant of the work done, and looks on Kew as a mere pleasure-ground.

NEW ROSE "EDITH TURNER" (supplementary illustration).—At the meeting of the Royal Horticultural Society at the Drill Hall, James Street, on July 12 last, a fine new hybrid perpetual Rose under the name of Edith Turner was exhibited by Mr. CHARLES TURNER, of the Royal Nurseries, Slough. It is a pretty flower of a pale flesh colour, the outer petals changing to white as the bloom ages. The petals are rather short and round, and the general form is good (fig. 27).

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Society will be held in the Drill Hall, on Tuesday, August 9. The committees will meet at noon, and at 3 P.M. a paper on "Water Lilies" will be given by Mons. LATOUR MARLIAC.

ROYAL BOTANIC SOCIETY.—At the annual meeting to be held on August 10, 1898, motions will be moved by Mr. J. S. RUBINSTEIN :—1. That this meeting is of opinion that the management of the Society would be attended with far greater success if the following recommendations were adopted :—(a) That the present system of electing the Members of the Council, whereby they are practically elected and re-elected year after year by the Council itself be brought to an end, and that the necessary alterations be made in the bye-laws to give the Fellows a real voice in the nomination and election of the members. (b) That the scientific and administrative branches of the Society's work be divided, and that a qualified and competent manager be appointed to supervise the work of each of the branches respectively. 2. That this meeting regrets that the Council has not thought fit to carry out the recommendation made at the last annual meeting in favour of the establishment of classes for the study of botany, to be open to all students, and again urges upon the Council the expediency of establishing such classes forthwith. 3. That this meeting recommends the Council to reorganise the refreshment department, and to take the necessary steps to apply to the magistrates at their next annual meeting for a full excise-license, to be used in connection with the restaurant newly erected in the gardens. 4. That this meeting, recognising the extent to which the success of the Society is dependent on the weather, believes that prosperity can best be assured by the erection of a floral-hall of adequate size, to serve as a winter-garden, and wherein exhibitions, flower-shows, receptions, and musical promenades, can be held in all seasons, and in any weather. This meeting therefore recommends the Council to invite architects to send in plans in competition for the erection, as soon as possible, of a suitable building, the necessary outlay being met by an issue of debentures.

THE STRAWBERRY-RASPBERRY.—Sir JOSEPH HOOKER, and Mr. WORTHINGTON SMITH, the artist, both agree that the appearances presented by the Strawberry figured (fig. 23, on p. 88 of our last issue), are due to excrecence from the receptacle rather than to a fleshy development of the achene. To the opinion of such authorities we respectfully defer, the more willingly as we did not see the specimen.

NURSERY EMPLOYÉS OUTING.—Messrs. KENT & BRYDON, seedsmen, of Darlington, in order to celebrate a quarter of a century's trading, generously provided an excursion on Saturday, July 30, for their employés, numbering about fifty. The party journeyed by road to Barningham, and the weather being fine the drive was most enjoyable. A dinner was provided at the Milbank Arms, and at the close of a short toast list a move was made to the moors, returning through the grounds of Barningham Park, by kind permission of Lady Milbank. After tea the whole of the party was photographed, and the younger members indulged in various games on the cricket field.

THE LOST ORCHIDS.—In the *Chronique Orchidéenne*, n. 15, dated March, is given an account of the annoying disappearance of Mr. JULES HYE'S Orchids from the Temple Show. What the future chronicler will think of this strange proceeding we can only imperfectly appreciate, for the Temple Show was held from 25 to 27 May inclusive, two months after the (alleged) date of publication of the *Chronique*!

"FLORA CAPENSIS."—The second part of the seventh volume has just been issued by LOVELL REEVE & Co. It contains the remainder of the Cyperaceæ, by Mr. C. B. CLARKE, and the commencement of the Gramineæ, by Dr. STAFF. Of this order about a hundred genera are enumerated, the arrangement being, as explained by the editor, Mr. W. T. THISTELTON DYER, different from that in the *Genera Plantarum*, and the other colonial *Floras* published since that work. These changes have been necessitated by further accretions of knowledge.

PETER BARR is a guest of Superintendent WILLIAM FALCONER, of the Bureau of Parks. Mr. BARR has visited nearly every country on the globe. He has been twice in Spain, and his opinion of the Spanish soldiery is not a very high one. He believes that the end of the present war is near, and that it cannot be other than a great victory for the United States. He says that the disposition of the Philippine Islands will be a grave question, because of the complications which may arise. Mr. BARR is enthusiastic over the Pittsburg parks, and the Phipps conservatory. So says one of our American contemporaries.

TRADE MARK.—A recent case, decided in the Court of Appeal, raised the question whether a dealer has the right to register a trade-mark for goods which he does not sell. Messrs. JAMES CARTER & Co. applied to register a butterfly with folded wings as a trade-mark for Oats. The application was refused on the ground that the butterfly was adopted as a badge by another firm who did not deal in Oats. The Master of the Rolls gave a negative reply to the question, "Can a man properly register a trade-mark for goods in which he does not deal nor intend to deal?" The consequence is, that Messrs. CARTER & Co. are entitled to register the butterfly as a trade-mark, in spite of the fact that another firm had made prior application, but had really made no effective use of the trade-mark, because they did not deal in the particular class of article covered by the mark.

OUTING OF EXETER GARDENERS.—Recently a party numbering over fifty persons made an excursion to Bicton, by kind permission of the Hon. MARK ROLLE. The weather was fine, and the scenery of the surrounding country, with its wooded slopes, luxuriant vegetation, and ripening corn, and an occasional peep of the sea, was much admired. The park was entered by the famous Araucaria avenue, one of the finest of its kind in England. In length it

measures 500 yards, and contains fifty trees, from 30 to 40 feet in height. This avenue was planted in 1843 by the late Mr. JAMES VEITCH, the founder of the nurseries on the Topsham Road, Exeter. Some of the more interesting trees noticed by the way were the evergreen Beech, the Tulip-tree, Liriodendron, the Nettle-tree, Celtis, and several of the Japanese Conifers. Among other particularly striking objects was a tree of *Magnolia grandiflora*, which was flowering profusely.

THE SOCIETY OF AMERICAN FLORISTS has hardly acted in consonance with the rules of grammar by adding to its title "and Ornamental Horticulturists." Does this account for the numerous portraits we see in the American trade journals?

WOODLICE IN MUSHROOM BED.—We copy from the *Journal of the Pharmaceutical Society* the following method for trapping woodlice:—Your best way will probably be to trap them with long strips of brown paper bent over like a conduplicate leaf, and smeared on one side with a mixture of treacle, footsugar, and beer. They will crowd to this, when the papers can be lifted up and shaken over boiling water. Small flower-pots coated on the inside with the same mixture are also good traps.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of the Floral Committee on July 13, 1898, First-class Certificates were awarded to Mr. C. Kwint, of Bloemendaal, for *Begonia tuberosa* fl.-pl. cristata; to Messrs. E. H. Krelage & Son, of Haarlem, for *Begonia tuberosa* fl.-pl. Orange Ball, B. t. fl.-pl. Souvenir de Pierre Notting; *Calochortus Gunnisoni*, and *Petunia "Sneeuwbal"*; to Mr. C. G. van Dijk, of Zeist, for *Schubertia grandiflora*. Certificates of Merit were granted to Messrs. E. H. Krelage & Son, of Haarlem, for *Ageratum Blue Perfection* and *Helenium Bigelowi*. Botanical Certificates were awarded to Messrs. E. H. Krelage & Son, of Haarlem, for *Calochortus obispoensis* and *Lilium elegans* Alice Wilson. H. C. Zwart, Secretary, Amsterdam.

WINCHESTER GARDENERS' ASSOCIATION.—On Tuesday last, Mr. J. C. NEWSHAM, F.R.H.S., Staff Instructor on Horticulture to the Hants County Council, delivered an able and instructive lecture on the "Cultivation of Ferns, Tropical and Temperate," the lecturer drawing special attention to the raising of Ferns from spores; and he urged his hearers to cultivate a taste for these plants. The meeting was largely attended, and a lengthy discussion followed the reading of the paper.

LADY SUFFIELD STRAWBERRY.—We have received from Mr. ALLAN, Lord SUFFIELD's gardener at Gunton Park, Norwich, a box of fruits of his new seedling sent out under the above name. It is a dark crimson, conical or wedge-shaped fruit, of an agreeably sub-acid, not particularly rich, flavour. The flesh is firm, and the seeds being prominent as well, it is a good packing variety. The season of this variety is now about over in the Norwich district, it is therefore a late mid-season fruit, and if it crops well is likely to find many admirers. We omitted to mention the fact that this variety received an Award of Merit at the last Royal Horticultural Society's meeting.

PUBLICATIONS RECEIVED.—*Annual Report on the Botanical and Afforestation Department, Hong Kong*, for 1897. The Report of Mr. Ch. Ford, the Superintendent, is encouraging, but contains no special items of news.—*Tropical Agriculturist*, July, 1898, containing various articles, notes, and extracts.—*Guides to Growers* (issued by the Department of Agriculture, Victoria), No. 36. The San José Scale; No. 40. Fruit Flies.—*Proceedings of the American Academy of Arts and Sciences*, June, 1898. Contributions from the Gray Herbarium of Harvard University, by J. M. Greenman. I. Revision of the Mexican and Central American Species of *Galium* and *Relbunium*; II. Diagnoses of New and Critical Mexican Phanerogams.—U. S. Department of Agriculture: *Preliminary Report on the Soils of Florida*,

by Milton Whitney; and *Bibliography of the more important Contributions to American Economic Entomology*, by Nathan Banks.—*Industria Agricola*, Caracas, E. E. U. U. de Venezuela. Mayo.—*Moniteur d'Horticulture*, July 25.—*Le Chrysantheme*, June.—*Bulletino della Società Botanica Italiana*, Nos. 5 and 6.—*Nuovo Giornale Botanico Italiano*, Vol. V., No. 3.

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 79 to 85.)

0, SCOTLAND, N.

CAITHNESS.—Last year being favourable for ripening the wood, such an amount of blossom in spring was rarely seen, but it got a severe check by the continued east winds. Gooseberries are an extraordinarily large crop, but every other kind of fruit is a fortnight late as compared with last year. Wm. Mackie, Dunbeath Castle Gardens, Caithness.

ELGINSHIRE.—This season is ten days later than an average season, but considering the very changeable weather, there is a fair promise of good fruit. Strawberries, Raspberries, and Black and Red Currants being very good quality. Standard Pears and Apples often deceive one at this period of the year, as it is in the later months that one can properly judge. Wm. Ogg, Duffus House Gardens.

MORAYSHIRE.—Fruit trees of all sorts showed a most abundant bloom, but the prevalent cold winds and frosty nights in the month of May, a great number failed to set a crop of fruit. The Codlins had the best crop among Apples; while Victoria, Mitchelson's and Coe's Golden Drop are best amongst Plums. Apricots and Peaches are as heavy a crop as we have had for some years, but all sorts of fruit-trees are much in need of rain, and a few sorts are casting the fruits for lack of moisture in the soil. Chas. Webster, Gordon Castle Gardens, Fochabers.

ROSS-SHIRE.—The Apple-crop in this district is an excellent one, though quite a fortnight later than usual, owing to the cold and backward season. Pears very poor in most cases, owing to precocious flowering on account of an open winter and spring. My remarks on Peaches and Nectarines apply to inside trees; very few are grown outside, even in favourable localities. Apricots are a thin crop. Insect pests have been very troublesome on fruit-trees, notably green-fly on Plums, grub on Apples, and the moth on Pears. The Gooseberry-caterpillars have not been numerous this season. W. Minty, Ardross Castle Gardens, Atness.

SUTHERLANDSHIRE.—Fruit trees generally had a fine show of bloom. The earlier flowering varieties of Apples, Pears, and Plums got spoiled with inclement weather and frosty nights about the middle of the month of May; but the later blooms set well, and there is a fair average crop of Apples, though some trees have but few fruits, and others are well laden. Aphides have been very prevalent. D. Melville, Dunrobin Castle Gardens, Golspie.

1, SCOTLAND, E.

ABERDEENSHIRE.—Apple and Pear-trees had an unusually abundant blossom, but owing to a continued east wind and cold rain when in flower, they did not set well, and are a very poor crop, excepting a few trees on the walls. Plums have done better, and are a fair crop. Cherries are also poor, except Morellos, which have a fair crop. John Forrest, Haddo House Gardens, Aberdeen.

—The Apple crop on the whole, considering the backward, cold spring, is a good average one. The prevailing spring weather had a disastrous effect on all kinds of fruit-trees and bushes, and rendered growth slow and weak, and this was made worse by the prevalence of insects. J. Brown, Delgaty Castle Gardens, Turriff.

BANFFSHIRE.—The outside fruit-trees had a very trying season, for from the first week in February the weather was cold, with biting winds. Blossom of all kinds was most abundant, and promised well, but the frosts in May, and the cold winds, proved very

destructive to the Plums, Pears, and Apples, both on standard trees and on walls, and aphides are very troublesome. The foliage of earlier-flowering wall-trees, even where protected, has suffered very badly, the Peaches especially. Strange to say, my Fig-trees trained on the open wall are better than usual. Strawberry Royal Sovereign is proving a great success. J. Fraser Smith, Cullen Gardens.

BERWICKSHIRE.—The weather during the time the fruit-trees were in blossom and setting was cold and sunless, hence the fruit did not swell, though there was a great promise. Trees bearing Apples, such as Manx Codlin, Ecklinville Seedling, Stirling Castle, &c., have set very thickly; the fruits are swelling capitally. The best new Apple that we have here is Newton Wonder, which is a good all-round culinary variety. Among Pears, Doyenné du Comice is still our best as regards cropping and quality. The Czar Plum I find a useful early one; it sets freely, and is otherwise desirable. The Gooseberry crop is enormous, as likewise red Currants. Rain is very much required in this part to develop the various fruits. J. Cairns, The Hirsell Gardens, Coldstream.

EAST LOTHIAN.—With the exception of Pears, all kinds of fruit blossomed abundantly. The weather during most of the flowering period was sunless and cold; I think one genial day was all the good-setting weather we experienced here. Late frosts were also harmful, but, as usual, their effects were not generally bad; Gooseberries and Strawberries, however, were badly damaged in some places. Early fruit has come on with great rapidity, and I cannot say I have ever seen Apricots and Plums larger and finer at this date. Aphids and fungus on the foliage has been troublesome. R. P. Brotherston, Tynninghame House Gardens, Prestonkirk.

FIFESHIRE.—The small-fruit crop in this district, as well as that on bush Plums and Pears, suffered very much from frosty nights in the middle of the month of May. The Apple-trees, excepting partially the earliest varieties, were not in bloom, consequently they escaped much damage, and promise a good crop. Red and Black Currants, as well as Gooseberries, were severely thinned by a frost of 6° in the middle of May. The frost experienced was very irregular, in some places there being scarcely any, while in places not far distant 10° were registered, doing, of course, all the more damage. At one time the season promised to be an early one, but owing to the cold nights in May and June the ripening of the various fruits will be normal. W. Williamson, Tarvit Gardens, Cupar.

FORFARSHIRE.—The fruit crop in the gardens here is quite up to the average, with the exception of Pears, which are almost a failure. There was a splendid appearance of blossom, and apparently the weather at the time was favourable, still very few fruits have set. The Apple crop is generally over the average, and a good many trees require to be thinned in order to secure fruits of a useful size. Strawberry Royal Sovereign has done well on young plants; but plants fruiting for the second time are not good. Growth has been very slow this season, and everything is later than usual. The summer has been very dry so far. W. McDowall, Brechin Castle Gardens.

MIDLOTHIAN.—Since the end of August, 1897, the weather has been, on the whole, comparatively mild, and unusually dry; the rainfall here for the ten months ending June 30, being only 7.45 inches, and for the whole year, ending on the same date, 11.98 inches, or about half an inch over the average annual rainfall. The result was well-ripened wood and buds, and the display of blossom on the fruit-trees in spring was profuse and extra fine. The spring months were generally dull and cool, with nips of frost at night, bright sunny days being rare, so that the "set" of fruit, especially on damp soils and in cold places, was not at all commensurate with the abundance of the blossom. Wall-fruit, as might be expected, set well, and Apricots, Peaches, Nectarines, and Cherries, are extra fine crops, requiring to be severely thinned. Cherries are the finest crop seen around here for many years, but the Morello is the

ception, bearing only a moderate crop. Among Dessert Cherries, Rivers' Early and Frogmore Early are very fine; but almost all the popular varieties are loaded with fruit. It is the same with Apricots, Hemskirk, and others of the Moorpark type, Early Oullin's and others of the Peach-picot type, and Pineapple being the best. Only early varieties of Peaches are, as a rule, worth their room on a wall in Scotland, but all varieties have fine crops, and mid-season ones—Bellegarde, Stirling Castle, Condor, Noblesse, and the like—will probably open well, although only early varieties can be trusted to ripen every season, among which Alexander, Early York, Early Rivers, Hale's, and Waterloo, are the most certain, and the two last are probably the best. Among Nectarines Pineapple seldom fails, and Lord Napier is a close second, but not so free-bearing or so rich in flavour. Elruge, Violette Hative, and Humoldt, are good; and the newer varieties, Early Rivers, Goldoni, and Cardinal, are promising additions to the Nectarines. Apples, Pears, and Plums, are a good all-round average crop; but some of the most regular bearers of each, for instance—the Codons among Apples, Hesse among Pears, and Victoria among Plums, are a thin crop, or none on many trees, while varieties with a bad reputation for bearing qualities are laden with fruit. With the exceptions referred to, it is still, however, the well-known popular varieties that are bearing the best crops of fine, clean, useful fruits. Small fruits are abundant, Currants and Raspberries being extra fine, Gooseberries and Strawberries a good average, the drought being against the swelling of the Strawberry crop, where artificial watering cannot be applied. Trees generally are free from insect pests, and have made a fine growth. Plums and Gooseberries are the exception, as they suffered badly in June from aphids. Crops are ten days late at present, and will require a warm autumn to bring the later varieties to full maturity. *M. Dunn, The Palace Gardens, Dalkeith.*

— The Apple is the crop of the year, whilst Pears, on the whole, are a thin crop, alike on walls, standard trees, bushes, and pyramids; a few very old common varieties, however, seldom fail to set a crop of fruit. Plums dropped many of the flower-buds, and trees that did not suffer in this way carry a fair crop. Golden Drop is the best Plum of this district on walls. The Morello Cherry is mostly a good crop. Strawberries are ripening three weeks later than last year. *D. T. Fish, Edinburgh.*

PERTSHIRE.—The fruit crops here are fairly satisfactory. Apples are abundant, and the quality promises to be good. There is a fair sprinkling of Plums on the open wall, but standard trees have failed. Peaches carry an average crop, and the trees are clean and in good health. All fruits are much later than usual. *A. Mackinnon, Dunblane Palace Gardens.*

WEST LOTHIAN.—After the very abundant supply of fine healthy blossoms on nearly all varieties of the Apple, the prospect of a good fruit year in this neighbourhood has been blasted. Among Apples the best-cropped varieties are Lord Grosvenor, Lord Suffield, Stirling Castle, and Cox's Pomona. The Pear crop on walls is a very good one. Damsons have a poor crop. *James Smith, Hopetoun Gardens, South Queensferry.*

6. SCOTLAND, W.

ARGYLLSHIRE.—There was a great abundance of bloom on fruit trees, particularly on Apples and Sweet Cherries. Of Apples Cox's Orange Pippin, King Pippin, Worcester Pearmain, Ecklinville, Lord Grosvenor, and Bramley's Seedling are heavily cropped. Amongst Pears the best are Madame Treyve, Beurré d'Amanlis, Louise Bonne of Jersey, and Marie Louise; others are thinner, but mostly they have a fair sprinkling. Plums on walls are a good crop. Damsons in orchards are a complete failure, partly owing to bullfinches. Morello and sweet Cherries are abundant. Black Currants are better this year than I have ever seen them here. *D. S. Milville, Poltalloch Gardens, Lochgilphead.*

DUMFRIESSHIRE.—Apples and Pears are a very short crop. We had a prospect of a full crop well

into the month of May, but after a few successive nights of frost, the embryo-fruits dropped wholesale. Early Strawberry blossoms were much crippled by frost; and the drought we have experienced of late in the Nith Valley has proved sufficiently trying to cause a considerable deficiency in the crop. The Currant crop is a grand one, and Superlative Raspberry is our best cropper by far. *David Inglis, Drumlanrig Castle Gardens, Thornhill.*

— The fruit crops in this district are, on the whole, fairly satisfactory this year. The varieties of culinary Apples that are bearing the best crops are Duchess of Oldenburgh, Lord Suffield, Keswick Codlin, Pott's Seedling, Ecklinville, Cellini, Hawthornden, Stirling Castle, Warner's King, Golden Noble, Blenheim Orange Pippin, Tower of Glamis, Peasgood's Nonsuch, Golden Spire, Lane's Prince Albert, Alfriston, and Northern Greening. Dessert Apples are rather under the average, but the trees, and what fruits there are, look in a healthy condition. The varieties with anything like a crop on the trees are Irish Peach, W. E. Gladstone, Devonshire Quarrenden, Worcester Pearmain, Oslin, Kerry, Cox's Orange, Sturmer, King, and Ribston Pippins, Scarlet Nonpareil, and James Grieve, an Apple of Scotch origin worthy to be recommended. Pears generally are an average crop, although some of the more tender dessert varieties are not up to their usual yield in this district. Plums are decidedly the best crop we have had for years, and are likely to afford very remunerative returns; but Peaches, Nectarines, and Apricots are not up to their usual standard out-of-doors. Small fruits, including Strawberries, are in great quantity, and the weather here for the past two weeks has been for ripening them in fine condition. In this immediate vicinity we did not suffer so much from sharp late spring frosts, but early crops and fruits generally were retarded in their early stages of growth, and were considerably damaged by lack of sunshine, excessive rains, and a low, damp, fluctuating temperature. *John Mackinnon, Terregles Gardens, Dumfries.*

STIRLINGSHIRE.—The various fruit crops are good generally. The promise of a crop at flowering-time was better than usual, but the cold nights throughout the month of May, and the frosts that occurred in June, thinned all crops—but not too severely—excepting Pears, Black Currants, and Sweet Cherries, which are scarce, while Morellos are plentiful. Strawberries suffered in June somewhat, but the crop is a fair one, and of good quality. Apples are plentiful, especially those which never fall, viz., Stirling Castle, Golden Spire, King of Pippins, Seaton House, Codlins of sorts, Sandringham, and Lord Grosvenor. *M. Temple, Carron House Gardens, Falkirk.*

WIGTONSHIRE.—The fruit crops in this district vary considerably this season. Strawberries are probably the lightest crop experienced for some years, and midseason and late varieties are less satisfactory in this respect than the early ones. The crops of Apples and Pears will require to be very little thinned. The Plum crop, whilst below the average, is pretty evenly distributed over the several varieties grown. Peaches and Nectarines are almost a failure, the trees having suffered very much from the cold weather in the spring. *J. Day, Galloway House Gardens, Garliestown.*

2. ENGLAND, N.E.

DURHAM.—Owing to the east wind and sea-fogs in the month of June, Apple, Pear, Plum, and Cherry trees were blighted to a degree that I have never seen exceeded during the last forty-five years, and to increase the seriousness of the matter, the foliage is in part eaten by caterpillars. Owing to the dry weather that has occurred for the last few years at this date, Raspberry-canes do not grow, and do not promise well for next year's crop. *R. Draper, Seaham Hall Gardens.*

NORTHUMBERLAND.—The Apple crop in this district will be light, but in this garden we have a promise of a good crop on many varieties. Only Pear-trees on the walls have fairly good crops, namely, the varieties Jargonelle, Louise Bonne of Jersey,

Doyenné du Comice, Emile d'Heyst, Hacon's Incomparable. That fine Pear Marie Louise failed to set any fruits. Victoria, Jefferson, Golden Gage have good crops. Aphides infested the trees severely. Apricots are a very good crop. The lack of rain is being severely felt in this district. Strawberry Royal Sovereign is extra fine this year, and Queen of Denmark promises to be very fine. *G. Harris, The Castle Gardens, Alnwick.*

— Hereabouts, after a very good promise in the early spring, the results are somewhat disappointing, the Apple-crop in particular being non-existent on many of the older trees. Pears on the walls are a good crop, but on pyramids there are none. Strawberries are a light crop; but the season will be short, the weather being dry. *George H. Ackroyd, Howick Hall Gardens, Lesbury.*

(To be continued.)

HOME CORRESPONDENCE.

THE ROUNCIVAL PEA.—Your remarks in the issue of July 23 respecting Rouncival Pea, do not carry the history of this Pea very far back. I enclose you a list of Peas and Beans from an old seed catalogue published in 1688—the oldest I have seen—and you will notice it contains five sorts of Rouncival Peas. I also enclose you an extract from an old gardening book of the same date. This maintains that Hotspur Pea, sown early, is ready for gathering in May (old style). This is as early as any of our first early Peas now, showing how little advance in the matter of earliness we have made. Our improvements in this respect merely maintain ground already taken up. Were not Rouncival Peas similar to our tall, wrinkled marrows? *Jno. C. Gould (Messrs. Sharpe and Co. Limited), Sleaford.*

A C A T A L O G U E OF SEEDS, PLANTS, &c.,

Sold by Edward Fuller, at the Three Crowns and Naked Boy, at Strandbridge near the May Pole, Theophilus Stacey, at the Rose and Crown without Bishop gate, and Charles Blackwell, at the King's Head near Fetter-Lane-end in Holborn, London, 1688.

SORTS OF PEASE, BEANS, &c.

Barns' Hotspur Pease	White Rose Pease
Short Hotspur Pease	Grey Rose Pease
Sandwich Pease	Egg Pease
Grey Rouncival Pease	Wing Pease
White Rouncival Pease	Sickle Pease
Blew Rouncival Pease	Windrow Beans
Green Rouncival Pease	Sandwich Beans
Maple Rouncival Pease	White Kidney Beans
Large White Sugar Pease	Speckled Kidney Beans
Small White Sugar Pease	Canterbury Kidney Beans
Grey Sugar Pease	Lentils

"SYSTEMA HORTICULTURÆ, OR THE ART OF GARDENING, 1688.
Of Pease.

Pease are of divers kinds, and some of them the sweetest and most pleasant of all Pulses; the meaner sort of them have been long acquainted with our English air and soil; but the sweet and delicate sorts of them have been introduced into our gardens only in this latter age.

There are divers sorts of Pease now propagated in England, as three several sorts of Hotspurs, the long, the short, and Barns' Hotspur, Sandwich, five sorts of Rouncivals, the Grey, White, Blew, Green, and Maple Rouncival. Three sorts of Sugar Pease, the large white, small White, and Grey Sugar Pease. The Egg-Pease, Wing-Pease, and Sickle Pease; whereof the Hotspurs are the most early, pleasant and profitable of all others. The Sugar Pease with crooked Cods, the sweetest of all. The large white and green Rouncival and the great Egg Pease we shall more particularly advise to be propagated in our Gardens.

The Hot-spurs are the speediest of growth of any, that being sown about the middle of May will in six weeks' time return ripe again into your hands, no vegetable besides being so quick in its growth and maturity; therefore let these be the first that you sow; if sown in February or March they will come earlier than any other sort sown before winter; but if you sow them in September, and can by Fences of Reed, or otherwise, defend them from extremity Frosts, you may have ripe Peascods in May following.

The large Sugar Pease (which many take to be a fair white sweet Pease succeeding the Hot-spur, but erroneously) is a tender Pease planted in April, and ripe after midsummer, the cods are very crooked and ill shaped, which being boy'd with the unripe Pease in them, are extraordinary sweet. The greatest discouragement in raising these, is that their sweetness attracts the small birds unto them, to their total destruction, unless carefully prevented; which is a sufficient argument of their pre-excellency.

The large white and green Rouncivals, or Hastings, are tender, and not to be set till the cold is over, and then not very thick, for they spread much and mount high, and therefore require the aid of tall sticks, every one knows the worth of them.

There is another very large grey but extraordinary sweet Pease, that is largely propagated, it is tender but very fruitful, and deserves a large bed in your kitchen garden.

They delight in a warm light soil; if it be rich the Pease are the fairer, if lean the Pease are the more early and spend better, especially when dry.

They are set with a Dibble to more advantage than sown in Rills or Furrows, but either way should be by a line, and the rows eighteen inches or two foot apart, as the ground is in goodness, that you may go between them to hoe, weed or gather them.

If you keep the ground between them bare, they will ripen the sooner, for the heat of the ground will contribute much thereto.

If you raise the Earth about them when they are a hand-breadth high, they will flourish the better.

If you set or sow them in the beginning of or before Winter you must inter twice as many Pease as you need to do in case you stay till February or March, because the Cold and the Mice will destroy a part.

Ground laid in deep Furrows from East to West and Pease sown or set on the South declining side of each furrow, will defend your Peas better in the winter than if they were sown or set on a level. For on the Wiltshire Plains the husbandmen leave their land after it is sown with Wheat as rough and clotty as they can, to shelter their Corn in grass from the severity of the cold winds in the winter.

Peas on sticks will bear more, but on the ground will ripen sooner."

STRAWBERRY MONARCH.—I would ask if the blindness of this variety is characteristic, or if it is due to the vagaries of the present season? Last year a bed of this variety was almost a failure in this garden, although blooms were an abundance. The bed consisted of young plants, and I felt considerable disappointment. I thought the plants grew too strongly; however, I planted a few runners out of pots last autumn, and both these and the plants which were blind last season have cropped heavily this year. It is a fruit with a firm pulp and good flavour, but our fruits were not quite so large as they are said to come in some soils. The best variety to fruit with me the first season is Laxton's Leader, which grows of an enormous size, and is of good flavour. The shape of the fruit varies somewhat, but the shape is generally good, and I know of no other Strawberry that is its equal for cropping the first year after planting. It is admirable as a forcer to follow Royal Sovereign, and makes but little leaf-growth. I find the best crops are obtained by planting the forced plants out, and letting them stand for two years. We force Royal Sovereign, Leader, Monarch, and Anguste Nicaise. I shall discard Monarch for forcing, and increase the number of Leader. Royal Sovereign, from runners planted outside, makes much leaf and little fruit the first season, but forced plants planted outside bear marvellous crops of fruit. The soil at Poltimore is heavy, and the subsoil moist. *J. H. Slade, Poltimore Gardens, Exeter.*

— In reference to remarks on page 73, the inference that the kind is dæcious will not hold good, as ours are surrounded on all sides by other varieties; but in our case they did not throw any flower stems, while, on the other hand, cutting out the blossom in the first year can scarcely cause them to go blind, as it distinctly strengthens the crowns for the following season. I should be more inclined to attribute it to the extreme dry seasons of 1896 and 1897. I learn from one grower he had some acres that on light land were a sheet of blossom, and on heavier land a portion only went blind. At Chiswick the flowers were not taken off the first year, and yet 80 per cent. were blind and threw no flower stalks. It evidently varies considerably in various soils, and in this respect is not alone. For instance, nothing could be finer than the Gunton Park shown by Mr. Divers, from Belvoir Castle garden, but with us it is a failure. One year we never picked a berry from it. *Geo. Bunyard.*

BLINDNESS IN STRAWBERRY PLANTS.—Not having had an opportunity to read my *Gardeners' Chronicle* of the 23rd ult. until some days after date, I had not seen the editorial note upon the blindness of my Strawberry plants Monarch. I find I am misunderstood, probably from not stating my meaning of the word more clearly. What I meant by "blindness" in my plants was, every plant failed to produce flowers. It is a term I have heard used all my life in reference to Strawberries, and particularly to plants grown in pots that do not produce flowers in the forcing season. *H. Fisher, Flixton Hall Gardens, Bungay.*

LOW TEMPERATURE.—During the night, July 28th, the temperature here fell to 33°; by the sides of a stream the grass was coated with hoar-frost. On July 29th the thermometer registered 34°. *Thos. Coomber, The Hendre Gardens, Monmouth.*

GROWTH OF ACACIA MOLLISSIMA IN CALIFORNIA.—A spontaneous seedling of this tree sprang up in our botanic garden in the summer of 1895, from scattered leaf-mould. Not being in the way of

other plants at the time, it was allowed to remain till June 29, 1898, when it was taken down for analysis of the bark for tannin. It had received no special care or cultivation, and no manure or irrigation, yet in the space of three years it had attained a height of 31 feet, with a spread of 24 feet at 6 feet from the ground. The trunk was 6 inches in diameter at 8 inches from the ground, and showed three clear annual growth rings. It flowered sparingly for the first time in the spring of this year. *J. Burt Davy, University of California, Berkeley, California U.S.A.*

THE BUNCH PEA.—I saw this growing in a Surrey garden recently. It was in a clump, and sown to produce a decorative effect, because the white and red hues of the flowers, and their clustered form, made them so pretty. It is generally assumed that the stems are fasciated. That is not so. They are round, hollow, and of quite natural form; the plant doubtless being a distinct variety from *arvense*. Of course, as a decorative plant it is a long way below even an inferior Sweet Pea; but were the flowers intercrossed with pollen from a Sweet Pea, possibly some hybrids of very interesting form might be obtained. No doubt it is the *Lathyrus umbellatus* referred to by Mr. Sherwood the other day, and there can be no doubt, as he showed, that it is exceedingly ancient. How it became associated with the mummy legend is a subject that should have attraction for leisured scientists. *D.*

A MISQUOTATION OF BUTLER'S "HUDIBRAS."—Allow me to correct "Experience's" curious misquotation of Butler in his notes upon "Market Gardening" in the last issue of the *Gardener's Chronicle*. If he will turn to Butler's "Hudibras," page 310, Part III., Canto III., he will find a jingle containing sense. It is as follows:—

"He that complies against his will,
Is of the same opinion still;
Which he may adhere to, yet disown,
For reasons to himself best known."

J. McDonald, Mongewell Park Gardens, Wallingford.

CAMPANULA MIRABILIS.—I am sending by separate post a photograph of *Campanula mirabilis*. The plant is the same from which your illustration of July 9 was made, but in a more developed condition. At the present time it has 120 flowers fully out, and as they last at least a fortnight in good condition, I think a great future is in store for this species. Its freedom of flowering is so profuse that I notice new buds are forming in the axils of the old flower-stems, which will make it almost perpetual flowering. *E. Scaplehorn, Woking.*

EARLY DWARF CAULIFLOWERS.—Having had very much to do with the introduction into commerce of that beautiful early Cauliflower Snowball, more than twenty years ago, I respectfully ask to be informed in what respect the variety named Snowflake, mentioned at p. 70, differs from it. I have seen numerous dwarf early Cauliflowers under diverse names during intervening years, but all are Snowball, and the very best and earliest, whitest and dwarfest, are still Snowball. I had so wide an experience of it because I used always to grow it for seed, and sowed my own seed only. I invariably sowed in a cold house in the middle of January, and had beautiful solid white heads ready to cut the first week in June, on an outside border, the heads being from 6 to 8 inches across, and snow-white. That is relatively as early as sowing in February in warmth. I cannot at all understand why every seedsman should want a new name. Gardeners who know no better, of course think the variety is new. *A. D.*

POTENTILLA THURBERI.—A plant has flowered in my garden for at least ten years, though I have no idea where it came to me from. It has been returned to me more than once by hasty namers of plants as *P. atrosanguinea*. I cannot be surprised that those who make it part of their duty to name plants for nothing, have not leisure to give them more than a passing glance, and if I send them anything rare, I am seldom surprised if I get a name which I know to be wrong, even if I do not know what is right. I formerly paid a fee of 1s. a plant, and sent the fee and the plant together to someone who would verify the name from an authenticated specimen in a first-class herbarium. I shall be glad to renew that practice if I knew where to send the plants, but after I had made several fruitless attempts to identify this *Potentilla*, the Director of Kew kindly got it named for me as *P. Thurberi* (*A. Gray*), native of North Mexico. I send these particulars

because the plant ripens seed freely. The seed comes up abundantly, and I have distributed it to many gardens as a good hardy plant without a name. It is from 1 foot to 18 inches high, making many self-supporting stalks. The leaves have five to seven pinnae, very silvery beneath; it flowers freely in July and August, the flowers being of a very deep brown-red, without any suspicion of purple taint, which cannot be said of those of *P. atrosanguinea*. A sowing two springs ago produced at least 500 seedlings, the residue of which I presented to Mr. J. Wood, of Kirkstall, for distribution. *C. Wolley Dod, Edge Hall, Malpas.*

NURSERY NOTES.

EDENSIDE, GREAT BOOKHAM.

LOVERS of Carnations will, if they journey to Bookham, Surrey, find in the several long span-houses at Edenside that Mr. Jas. Douglas has provided a floral feast indeed for their delectation. Mr. Douglas is, as all the world knows, a true florist. He does not grow his myriad varieties of Carnations in borders outdoors, because his object is not garden decoration, but rather the presenting of the flowers in the finest and most perfect condition on the exhibition table, at the same time illustrating the remarkable value of these plants for pot-culture under glass. It is probably true that there is not a finer collection of all sections of the Carnation in the kingdom. Probably in all the houses there are not less than 10,000 pots, and as each pot, 8 or 9 inch, contains two or three plants, the number is greatly increased. The new show-house, 100 feet by 21½ feet, is crammed full of plants, all in the finest possible condition, with a carefully-estimated 3000 pots, and other houses are just as full. A large number of seedlings are blooming out in the open ground, and of these only anything that is very fine is selected. Fine, indeed, must be the seedling that can excel the best-named varieties, yet new ones are constantly coming to the front.

Those who may think they have something in the way of seedlings of special excellence should see the Edenside collection ere they assume that they possess superior novelties. Very material strength to Mr. Douglas's collection is furnished by the possession of the stocks of all that famous raiser, Mr. Martin Smith, has produced. That distinguished amateur has done much to revolutionise the Carnation, and Mr. Douglas has also done a great deal in the same direction. It looks now as if the newer and finer flowers, though of far less precise flaked or bizarre, would overthrow in public estimation the old show varieties, although these have numerous admirers. The great development in Carnations has been chiefly amongst the huge-flowered Malmaisons, beloved by millionaires, the lovely yellow-ground Picotees, and the very beautiful and varied selfs. All these, but the two latter sections especially, have the particular merit of giving marked distinctness—points not so observable with many of the flakes and bizarres of the florist, and for this reason the former find more favour with the pure flower-lovers. However, Mr. Douglas grows varieties for everybody; and any intending grower should first see what is in bloom, and make a selection under the most favourable conditions, rather than from mere description. Carnations generally are late this year. At the time of our visit (July 19), the plants wanted on the whole fully ten days to get them into perfect bloom. That fact shows how desirable it was that the National Carnation Society's Exhibition should be held at a later date than was originally fixed upon. A marked feature of many of the new varieties—and it is one Mr. Douglas points out with great satisfaction—is the rarity of pod or calyx-splitting, which has marred the beauty of so many fine flowers in the past. Some day we hope no variety will be put into commerce that splits its pods; nay, we even hope the time will come when the National Society will rigidly exclude from its exhibitions all burst flowers. The rage for huge Cabbage-rose-like Carnations has done much to make pod-bursting common. The

true florist should rise up in arms against this evil, and fight it to the death.

Special enquiry into the Edenside Carnation compost reveals two interesting facts—the first is, that the much-distrusted moss-litter manure is largely employed; the second is, that no description of artificial manure is used. There are, therefore, no booms for all sorts of questionable compounds to be got out of the Carnation in the same way that they are obtained through the Chrysanthemum. Growers who are but amateurs, will please note that the compost which produces at Edenside such splendid results, consists exclusively of a stiff turfy loam two-thirds, and one-third of moss-litter manure. This compost is made by building up a stack in the autumn, and another in the spring of thick layers of turf, and thinner ones of the manure to about 5 feet in height then the whole well heats and quite destroys all insect or fungoid life. When chopped down and put on the stage, a proportion of one-sixth or so of old mortar run through a sieve is mixed with it. Sometimes, but not regularly, a little soot is added. It will thus be seen that no quack composts are favoured. In the matter of propagation, all the numerous fine Malmaisons have sometime been layered, and the earlier ones of other sections are being proceeded with. Probably some 60,000 layers have to be put down, possibly many more. This work will go on during August, even into September. Some varieties make their shoots rather high up, and these have to be propagated by cuttings, or by turning the plants out into the open ground, planting them obliquely, and then layering the shoots. In respect of propagation, varieties differ materially, some giving plenty of grass, others little, each one therefore has to be treated according to its habit.

Generally, Carnations here may be divided into three sections: the Malmaisons, with their broad fleshy foliage, and huge but rich high-class flowers; the tree, that are more generally adopted for winter use, but are here induced to bloom in the summer for seed-production; and the ordinary section, which includes everything else pretty well.

Malmaison Carnations.—Besides the blue, pink, and scarlet forms so widely grown, there are that superb Scarlet Churchwarden, a brilliant scarlet; Prime Minister, richly perfumed, an even richer scarlet; Trumpeter, very fine; Lady Grimston, ground flesh white, then heavily flaked and speckled bright red, very free-flowered and sweet-scented. A very pure white one is Nell Gwynne, which everybody will want to have, as it is the first pure white Malmaison raised. Mrs. Everard Hambro and Lord Rosebery are other fine varieties.

Tree Carnations.—Entirely of his own raising, Mr. Douglas has a fine batch of novelties in this section that will be valuable additions to our present winter bloomers. The flowers are of the best form and good substance, but rather larger than has usually been found amongst trees; Alfred Grey, primrose, flaked pale rose, is a lovely flower; Cornus is pure white, wonderfully free, a charming button-hole flower; Julian, rich crimson-scarlet, wonderfully free; Sylvanus, bright purple, one of the first of that colour in the section; Regalia, a lovely soft rosy-carmine, also very free; Patrocles, rich scarlet; and some others. These varieties, so far as they have been fertilised, are seeding well.

Yellow-ground Picotees are taking very high rank both as pot and exhibition flowers; they have exceeding beauty, as well as good size and substance. The yellow ground, with the informal Picotee edging, presents attractive features that all Carnation lovers appreciate. Of this section, a few we saw in fine bloom were Mohican, rosy-red margin, very fine; Dr. Vish, edged rosy-lilac, very distinct; Wanderer, edged fine rosy-red; Mr. Nigel, having a heavy crimson edge; Mrs. Tremayne, heavily edged and flushed fiery red, a very striking flower; His Excellency, primrose, thin rose-edge; Voltaire, Miss Violet, Harlequin, and Badminton also are each very beautiful.

General Collection.—Of this, the rich and beautiful selfs seem to have the most attractive forms. Many are large, full, indeed superb flowers, Frances

Wellesley, red, shaded rose; Mrs. Jas. Douglas, rich rosy-carmine; Sir Henry Irving, velvety crimson; Hampden, salmon-buff, greatly superior to Mrs. Reynolds Hole; Diana, lemon-yellow; The Druid, bluish-mauve, a quaint colour; Nautch Girl is a lovely blush-white, with fine shell petals; B. ndigo is distinct blue, shaded purple, a very novel and striking colour; The Cadi is a lovely scarlet, of fine form; Elfin, a fine pure white; Zoe, a charming rosy-lilac; and Artemis is bluish, heavily flaked scarlet, a striking fancy. These are, however, but a few out of the many in this superb collection. Seeing what Carnations now are, we may well wonder what they will be like some ten years hence, for the progress made during the past decade has been surprising. The Carnation fancier can now have his fill of this beautiful summer flower.

FIG. 28.—SANDER'S ORCHID-PAN: SHOWING PAN IN HANGING POSITION.

FIG. 29.—SANDER'S ORCHID-PAN: SECTION.

NEW INVENTION.

SANDER'S PERFECT ORCHID-PAN.

It might be supposed that to make anything new in Orchid-pots and pans was an impossibility; but Messrs. Sander & Co., nurserymen, of St. Albans, Herts, have introduced to our notice a novelty which seems to possess improvements in a variety of directions. As will be seen by the illustrations (figs. 28, 29), stagnation of water is not possible, and the raised interior with the numerous openings, secures air for the roots of the plants, besides rendering the pan lighter by the lesser number of crocks required. The roots have a safe place in the dome in which to develop, and they ramify freely from the fact of exterior and interior surfaces being well adapted for their growth and protection. The pan is convenient, durable and simple, and it is nearly as cheap as the ordinary ware, and much cheaper than wooden baskets.

FLORISTS' FLOWERS.

CARNATIONS IN THE OPEN BORDER.

ONCE again are the grateful border Carnations in blossom, and the beautiful tints of colour, and the characteristic habit of each is not the less interesting than attractive. But this season these Carnations are not quite so satisfactory as they have usually been, and this I attribute chiefly to the exceptionally mild winter of 1897-98, and in a lesser degree to the very cold ungenial weather during spring and early summer. Our system of cultivation is that of potting up the plants in layers in autumn, and planting them into their flowering quarters in spring. I never planted out finer, better rooted, plants than this year, but the results as compared with those of past seasons, are disappointing.

This is more apparent in the "grass" than in the quality of the flowers, it being weak and lacking that glaucous tint that accompanies rude health, and is so desired by the cultivator. This defect is noticeable, too, in the weaker growing varieties, and in these older types, the same stock of which has been propagated for several years in these gardens. This suggests that it may be advisable to grow some of the weaker varieties in pots, and with glass protection, but such a practice is not likely to become general in private establishments, and is a system which I am afraid would never receive general support from private growers; unless the flowers are desired for exhibition purposes, owing to the necessary glass accommodation being required in other ways. It must not be inferred that I object to such a system, but I would prefer to see a selection of the stronger habited varieties grouped together in a garden border, than have to go under glass in July to inspect varieties which, owing to their delicate constitution, are unsatisfactory out-of-doors, and consequently less valuable.

I will now add a list of those varieties which have grown well under adverse circumstances, and may therefore be recommended as strong-growing border Carnations that will really succeed under border treatment. Raby Castle, Countess, Duke of Orleans, Duchess of York, James Douglas, Evelyn, Corunna, Brigadier, Miss Audrey Campbell, Sarah Payne, Pride of the Garden, Lady Nina Balfour, Mrs. Sutton, Gloire De Lavey, Amy Herbert, Zephyr, Miss Jane Douglas, Cassandra, Belladonna, Sadek, Don Juan, Miss M. Sullivan, Silver Strand, The Czar, Mrs S. Bouverie, Endymion, Mrs. Calby Sharpin, Lady Ridley, Pandelli Ralli, and Dick Donovan; these are in every way satisfactory.

The following varieties have shown signs of weakness, Lord Lyons, Gordine, Cardinal Wolsey, Sir B. Seymour, Zoe, Braw Lass, Annie Newman, Niphetos, Abigail, William of Wykeham, Mrs. F. Watts, Duchess of Portland, Joe Willet, Flora, Masterpiece, and Ellen Terry. J. H. McLeod, Roehampton.

LAW NOTES.

BANKRUPTCY OF W. CHAMBERS, FLORIST, HOUNSLOW.

THE Official Receiver for the Brentford district has now issued particulars under the failure of William Chambers, Florist, 147, High Street, Hounslow, and The Westlake Nursery, London Road, Hounslow, from which it appears that the debtor has filed a statement of affairs showing gross liabilities amounting to £671 13s. 1d., of which £593 14s. 1d. is due to unsecured creditors. The assets are estimated to produce £520 3s. 9d., from which £67 19s. has to be deducted for the claims of preferential creditors, payable in full, leaving net assets at £452 4s. 9d., and showing a deficiency of £141 9s. 4d. The debtor alleges his failure to have been caused through "Want of capital, bad debts, and bad seasons," and admits that he became aware two years ago that he had not sufficient property to pay his debts in full.

A preliminary meeting of the principal creditors was held at the offices of the Official Receiver, when it was decided that the business should not be carried

on, and that the Official Receiver should realise the effects belonging to the estate.

CLAIM FOR WORK PERFORMED.

MOORE v. GREENFIELD.—The plaintiff in this action, a builder, of Southfields, sued the defendant, who is connected with the Metropolitan Floral Association, Limited, to recover the sum of £18, at the last sitting of the Wandsworth County Court, before his honour Judge Lushington. The plaintiff stated that he received the order from the defendant, and rendered him the account in due course. The defendant never repudiated his liability, neither did he say that the work was for the firm. The work included certain hot-water fittings to a hot-house at Earlsfield. The defendant alleged that the work was done for the company, on whose behalf he gave the orders. His honour found for the plaintiff, the exact amount to be settled by an arbitrator, and the question of costs was reserved.

CARRIAGE OF ORCHIDS.—ACTION AGAINST THE GREAT EASTERN RAILWAY COMPANY.

On Friday, July 29, before Mr. Justice Day and a common jury, John Wm. Moore, nurseryman and Orchid importer, of Bradford and Rawdon, for whom Mr. Shepherd appeared, sued the Great Eastern Railway Company, who were represented by Mr. E. Tindal Atkinson, Q.C., and Mr. Kemp, for £123 13s., the value of 2473 Orchid plants, at 1s. each, which, it was alleged, were destroyed through the negligence of the defendant company.

The case for the plaintiff was that the Orchids were collected in Burmah, and shipped from Rangoon to Tilbury Docks, London, whence they were forwarded to Bradford by the Great Eastern Railway Company, who were, it was said, instructed to convey them in a "box truck," so as to protect them from the weather. The defendant company being unable, as they stated, to find a box truck at the short notice given, carried the plants in an open truck covered by straw and tarpaulin. The consequence was, the plaintiff alleged, that many of the plants were destroyed by rain, which penetrated the tarpaulin.

The defendant company denied that the condition of the Orchids was due to the rain, and in support of this contention, Mr. Atkinson put in the witness-box Mr. J. O'Brien, of Harrow-on-the-Hill, and a Fellow of the Royal Horticultural Society.

In the end the jury found for the plaintiff, and his Lordship gave judgment for the amount claimed. Stay of execution, however, was granted for ten days.

BOOK NOTICE.

VEGETATION AND SCENERY.

A LITTLE book, illustrated with plans and engravings, by Messrs. Olmsted, of Boston, U.S., under the above title, is intended more especially for the citizens of Boston. The general principles enunciated are, however, applicable everywhere else, according to local conditions. The report, it appears, was written by the late Charles Eliot, whose visit to this country some years since is not forgotten. The book deals with the "metropolitan reservations" secured by the city of Boston, and with the method of securing for the enjoyment of present and future generations such interesting and beautiful scenery as the lands acquired can supply. A detailed survey of the ground and of its vegetation is made. The latter is divided into—1, that of the summit; 2, of the swamp; 3, the coppice; 4, the field and pasture; 5, the bushy pasture; 6, the seedling forest.

It is a book from which the conservators of Epping Forest and similar areas, devoted to the public use, might derive many useful hints. We cannot particularise, but we may append the conclusions at which Mr. Eliot arrives from a consideration of the whole subject:—

"With regard to the relation of the vegetation of the reservations to the present and future scenery, perhaps the most important conclusions to be drawn from this investigation are the following: It is found that the vegetation of the reservations is an exceed-

ingly important component part of the scenery. It is found, moreover, that the present vegetation—its variety and beauty, as well as its monotony and ugliness—have resulted from repeated and continuous interference with natural processes by men, fire, and browsing animals.

"It follows that the notion that it would be wrong, and even sacrilegious, to suggest that this vegetation ought to be controlled and modified, must be mistaken. The very opposite is found to be the truth, namely, that as the beauty or ugliness, and scenic appropriateness or inappropriateness of the present vegetation is due to the work of men, so also will the vegetation of the future be beautiful in itself, and helpful or hurtful to the general scenery, according as it may or may not be skilfully restrained, encouraged, or modified during the next few years.

"Simply to preserve the beauty of so much of this vegetation as is now beautiful, or the suitability of so much as is now suitable—for example, the tree-fringed vales of grass, the open groves of great trees, the intricate shrubberies of old pastures, and the dwarf ground-cover of the hill-tops—will necessarily require continual painstaking care. To restore variety and beauty in the now more or less degenerate or ruined woods will similarly demand intelligent attention. So to control, guide, and modify the vegetation generally, that the reservations may be slowly but surely induced to present the greatest possible variety, interest and beauty of landscape will particularly require skilled direction.

"That such preservation, restoration, and enhancement of the beauty of vegetation and of scenery are only to be accomplished by the rightly-directed labour of men, is the principal lesson taught by this study of the present condition and the past history of the vegetation of the reservations. To preserve existing beauty, grass-lands must continue to be mowed or pastured annually, trees must be removed from shrubberies, competing trees must be kept away from veteran Oaks and Chestnuts, and so on. To restore beauty in such woods as are now dull and crop-like, large areas must be gradually cleared of sprout-growth by selling the standing crop, subsequently killing the stumps, and then encouraging seedling trees to take possession. To prepare for increasing the interest and beauty of the scenery, work must be directed to removing screens of foliage, to opening vistas through "notches," to substituting low ground-cover for high woods in many places, and to other like operations which are, in some measure, illustrated by the accompanying diagrammatic sketches. The sooner all these kinds of work are entered upon systematically, the finer will be the scenery of twenty and fifty years hence, and the more economically will that scenery have been obtained."

SOCIETIES.

CHESTERFIELD HORTICULTURAL.

JULY 27.—In delightful weather the annual exhibition of the above Society was held in The Queen's Park on the above date. Heavy rain early in the morning had helped to freshen up the flowering plants, and the park was looking at its best, and certainly the Chesterfield Corporation have just cause for feeling proud of their public park, and it is very pleasant to notice how the park increases in beauty year by year under the management of Mr. Wood, the Superintendent.

For a group of plants arranged for effect, to cover 150 square feet, Mr. Nelson, gr. to A. BARNES, Esq., Ashgate Lodge, maintained his well-earned reputation by gaining the 1st prize; followed closely by Messrs. ARTINDALE & SONS, Sheffield; Mr. HASLAM, Hardstoft; and PARKS, Whittington, in the order named. While for smaller groups (80 square feet), the 1st prize went to Mr. Mottershaw, gr. to A. G. BARNES, Esq., Tipton Hall; and 2nd, Mr. Polkinghorne, gr. to Mrs. BARNES, Ashgate House. For specimen Ferns, Mr. NELSON was followed by Messrs. POLKINGHORNE and HASLAM; while for stove or greenhouse plants, black and white Grapes, and collection of vegetables, Mr. NELSON also took 1st prizes.

With a group of tuberous rooted Begonias of very good quality, Messrs. PROCTOR & SONS, Chesterfield, were easily first, the same firm also occupying first place for thirty-six blooms of H. P. Roses and for twelve of Tea's, followed in each case by Mr. HASLAM.

Cut flowers, stove or greenhouse, twelve bunches, was an attractive class, and equal firsts were awarded to Messrs.

PROCTOR and Mr. NELSON; while for hardy or half-hardy flowers, eighteen bunches, a splendid lot of flowers were staged, and the prizes awarded, 1st, PROCTOR & SONS; and 2nd, ARTINDALE & SONS.

Mr. HORSMALL gained the premier position for Peaches; A. J. WESTBY for Nectarines and Melon, as well as for both red and yellow fruited Tomatoes.

Messrs. PROCTOR & SONS also showed in their best form for ball-room bouquet, bridal bouquet, and bouquet of Roses, in each case securing 1st honours. A very attractive feature of the show was a large collection of Caladiums from Messrs. ARTINDALE & SONS, Sheffield; and from Messrs. W. B. & SONS also came a fine collection of Sweet Peas.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 28.—At the meeting held at the Coal Exchange, Manchester, on the above date, there were present Messrs. G. Shorland Ball (in the chair), Law Schofield, Greenwood, Backhouse, Robson, and Mills (Hon. Sec.).

SAMUEL GRATRIX, Esq., Whalley Range (gr., Mr. McLeod) showed *Laelio-Cattleya Canhamiana alba* (First-class Certificate), and *Cypripedium excelsior* var. *Mars* (Award of Merit). G. W. LAW SCHOFIELD, Esq., Rawtenstall (gr., Mr. Schill), showed *Cattleya gigas Schofieldiana*, a small flower with an exceptionally dark coloured lip (First-class Certificate); *Cypripedium ciliolare* × *Philippense* (Award of Merit); and *C. Clinka berryanum*, *C. Philippense* × *C. Curtisii*. H. SHAW, Esq., J.P., Birch Vale (gr., Mr. Cliffe), showed *Cattleya Forbesii*. Messrs. J. VEITCH & SONS (Limited), Chelsea, showed *Laelio-Cattleya callistoglossa ignescens*, a very fine cross between *Cattleya gigas Sanderiana* and *Laelia alba purpurata* (First-class Certificate); *Laelio-Cattleya Amesiana*, a flower very good in form and substance, but lacking in colour, and being a cross between *Laelia crispata* and *Cattleya maxima* (Award of Merit); *Cattleya Eldorado alba*, *C. Enid*, *Laelio-Cattleya Zephyra*, and *Phaius Humbloti*. Messrs. CHARLESWORTH & Co., Bradford, showed a magnificent form of *Cattleya Gaskelliana alba* (First-class Certificate), and *Laelio-Cattleya Adolphus*, a cross between *L. cinnabarina* and *C. Acklandiae*. Mr. JOHN ROBSON, Altrincham, showed a good dark form of *Cattleya Schofieldiana* (Award of Merit), and *Brassia Lawrenceana longissima*.

NEWPORT AND COUNTY HORTICULTURAL.

JULY 23.—This Society held its annual show in King's High Field, Newport, on the above given date.

The exhibits generally were of much merit, and more particularly the flowering, stove, and greenhouse-plants, from Messrs. CYPHER & SONS, Cheltenham, and Mr. LOCKYER, of The Gardens, Pontypool Park. Amongst cut flowers, the Roses, Carnations, Picotees, and Dahlias, were remarkably good. Vegetables were also well shown in the open and in the cottager's classes. Amongst fruits, however, there was nothing excepting Gooseberries of particular merit. With few exceptions Grapes lacked colour, Peaches and Melons were but second rate, and the date was too early for Apples and Plums to be shown. Pieces of Silver Plate were offered as 1st, 2nd, and 3rd prizes for table-decorations, open to ladies only, each table to seat eight persons. There were fourteen entries in this class, a tent being devoted to them, where they made a very attractive display.

Six Stove and Greenhouse Plants in bloom.—1st, Messrs. CYPHER & SONS, Cheltenham, with grand plants of *Phenacoma prolifera Barnesii*, *Statice profusa*, *Ixora Williamsii*, *I. Prince of Orange*, *Stephanotis floribunda*, and a *Kalosanthes*. Mr. LOCKYER, gr., Pontypool Park, who was a very good 2nd, had good, fresh, well-flowered plants, a size smaller than the 1st prize lot, of *Erica depressa*, *Bougainvillea tanderiana*, *Clorodendron Balfourianum*, *Anthurium Scherzerianum*, *Allamanda grandiflora*, and *Ixora Williamsii*.

Four Stove and Greenhouse Plants.—1st, Mr. ROBINSON, Cardiff, with good plants of *Allamanda Hendersonii*, *Bougainvillea glabra*, *Ixora Williamsii*, &c. Col. WALLACE, Newport, followed closely with *Eucharis amazonica*, *Clorodendron Balfourianum*, *Rondeletia speciosa*, &c.

Six Ornamental Foliage Plants.—With these Messrs. CYPHER & SONS, were again 1st, having large plants of *Kentia Belmoreana*, *K. Fosteriana*, *K. australis*, *Latania borbonica*, *Croton Cheloni*, and *C. angustifolius*; 2nd, W. J. BUCKLEY (gr., Mr. Carpenter), who had good specimens of *Croton Warreni*, *C. Weismanni*, *Thrinax elegans*, &c.

A Specimen Stove-plant.—Mr. LOCKYER was 1st with a grand *Clorodendron Balfourianum*; 2nd, Mr. ROBINSON, with *Allamanda Hendersonii*.

Group (Open) of Plants arranged in a space 11 feet in diameter.—1st, Mr. ROBINSON, with a light arrangement of plants, those most prominent being *Lilium speciosum*, *Gloxinias*, *Ixoras*, *Dracenas*, *Palms*, and *Ferns*; Colonel WALLACE was a close 2nd with a group similar to the above. The pots were too visible in both the winning groups. The unsuccessful groups lacked bright colours, and were too heavy in the arrangement of the plants.

Group arranged in 50 square feet.—Here W. J. BUCKLEY, Esq., was placed 1st with good plants, well arranged, consisting of *Cattleyas*, *Cypripediums*, *Lilium auratum*, *Begonias*, *Palms*, *Ferns*, &c., edged with *Panicum variegatum*; 2nd, R. D. BROWNING, Esq. (gr., Mr. H. A. Joy), who likewise had a beautiful group, somewhat more heavily arranged, than the 1st prize group.

CUT FLOWERS.

Roses, twenty-four Hybrid Perpetual, distinct.—1st, Mr. STEPHEN TRESEDER, Cardiff, with beautiful blooms, his best being Duchesse de Morny, Duchess of Bedford, Mons. Etienne Levet, Kaiserin Aug. Victoria, Fisher Holmes, Alf. Colomb, and Madame Victor Verdier; 2nd, Mr. CROSSLING, Ennarth, his best being Ulrich Brunner, Countess of Rosebery, Chas. Lefebvre, Marchioness of Dufferin, Dupuy main, &c.

Roses, twelve Tea-scented.—1st, Mr. S. TRESEDER, with fine blooms of Innocente Pirola, Hon. E. Gifford, The Bride, Furiel Grahame, Comtesse de Nadaillac, &c.; 2nd, Mr. CROSSLING.

Carnations, twelve distinct.—1st, A. W. PIKE, Esq., Cardiff, with large, well-coloured blooms of Horace Trelawney, Miss L. Terry, Germania, Nisbet Hall, Rifleman, Cardinal Wolsey, &c.; Mr. W. TRESEDER, Cardiff, was a good 2nd, with well-formed blooms, smaller than the 1st lot.

Twelve Picotees.—1st, Mr. W. TRESEDER, with Amelia, Mr. Sharp, Mr. Rudd, Mr. Wilson, Mr. Kingston, &c.; 2nd, A. W. PIKE, Esq.

Dahlias, twenty-four, double.—1st, Mr. W. TRESEDER, who had William Keith, Warrior, Buffalo Bill, Kathleen, Flora Wyatt, Harry Heath, Mr. Glascock, &c.

Twelve bunches, Dahlias, Cactus.—1st, Mr. W. TRESEDER, with Starfish, Miss A. Jones, Fusilier, J. T. Barber, Matchless, Standard Bearer, J. E. Trewer, &c.; 2nd, Mr. BASHAM, Bassaleys.

Mr. W. TRESEDER was 1st in the classes for wreaths, crosses, and bouquets; W. JONES & SON, Maindee, being 2nd in each class.

FRUIT.

Collection of Fruit, six varieties.—1st, Mr. PITT, Abergarrenny, with a Queen Pineapple, Muscat and Black Hamburg Grapes, Countess Melon, Barrington Peaches, and a fine dish of Pineapple Nectarines; 2nd, Mrs. PARKINSON.

Grapes, white, three bunches.—1st, S. DEAN, Esq., with good bunches of Buckland Sweetwater; 2nd, Mr. PITT.

Black Grapes, three bunches.—1st, H. A. BROWNING, Esq., with Black Hamburg; 2nd, Mr. PITT.

Peaches, dish of five fruits.—1st, E. LEWIS, Esq. (gr., Mr. Green), with Barrington; 2nd, Mr. PITT, with Royal George.

For table decorations.—Mrs. GRATTE was deservedly placed 1st, with an exquisite light arrangement; Mrs. COULMAN being a good 2nd; Mrs. THEODORE VACHELL, 3rd; and Mrs. CHAS. FIRBANK, 4th.

HORNSEY HORTICULTURAL AND ALLOTMENTS ASSOCIATION.

AUGUST 1.—The third annual exhibition of the above association was held on Bank Holiday, and attracted several thousands of local residents. The entries numbered 568, an advance of 260 on the figures of the previous year.

The quality of the exhibits was held by the judges, Mr. Burt, The Gardens, Caenwood Towers, Highgate; Mr. J. Brooks, of Highgate; and Mr. E. Rowbottom, Bishopsdown Estate, Tunbridge Wells, also to have considerably improved, though the dry weather has been severely felt. The vegetables were particularly good, and there was keen competition, except in the case of Scarlet Runners and French Beans, which were poorly represented. One exhibitor took eight 1st prizes, six 2nd, and seven 3rd. Mr. W. Wood, Middlesex County Council, opened the show, in the absence of Mr. H. C. Stephens, M.P. for the division, and he was supported by Mr. Lowles, M.P., of Haggerstone, and several members of the District Council. A programme of sports was carried out in the afternoon, and in the evening the prizes were distributed by Mrs. W. P. Wood. A good band was in attendance all day.

CASTLEFORD FLORAL AND HORTICULTURAL.

AUGUST 1, 2.—The eleventh annual show was opened on the Football Field, and, like its predecessors, it was a great success. The committee offer liberal prizes, and the result is that they attract good exhibits from the North of England.

The following were the most interesting among many exhibits of great merit. For the group of plants arranged for effect (175 square feet), Mr. JOE SHARP, of Almondbury, was 1st, with a light and graceful arrangement, the group including some grand Crotons. The 2nd prize went to T. BLACKER, of Selby, who showed good-coloured Crotons, but lacked taste in arrangement.

For twelve stove or greenhouse plants, there was a strong fight, the Marquis of ZETLAND (gr., Mr. Nicholas), being 1st, showing some grand specimens of Crotons Warreni and angustifolius, Dipladenia Boliviensis and Williamsii, Anturium Scherzerianum and Wardi, also a very fine piece of Stevensia grandiflora, and Cycas circinalis. The 2nd prize was won by Mr. JOE SHARP, who had a good exhibit. For six stove or greenhouse plants, Mr. JOE SHARP was 1st, showing, among others, a fine piece of Anthurium Scherzerianum of a good variety. For six Ferns, stove or greenhouse varieties, the Marquis of ZETLAND got 1st with good plants of Cyathea debata, Gleichenia flabellata, G. rupestris glaucescens, Adiantum Farleyense, &c. For four Crotons, 1st, Mr. JOE SHARP, with nicely coloured plants. Four Dracenas, the Earl of ZETLAND, whose collection included a nice plant

of Dracaena Doucetti variegata. Six zonal Pelargoniums, 1st, Mr. J. BLACKER, with a nicely grown lot of good varieties.

In the cut bloom classes the exhibits were not so numerous, but those shown were of fine quality. For thirty-six Rose blooms, distinct, Messrs. J. & R. CALEM, of Wakefield, were 1st, with clean fresh blooms. For twelve Roses, Messrs. J. & R. CALEM were again 1st.

In the fruit classes, the premier awards were taken by Lady BEAUMONT, Carleton Towers (Mr. Nicholls, gr.), who staged some excellent examples of Buckland Sweetwater. In the class for black Grapes, some splendid bunches of Madresfield Court were shown by the Marquis of ZETLAND.

One of the great objects of this Society is to encourage the love of gardening among the miners and glass-blowers who compose the major part of the population of the district, and the committee certainly may congratulate themselves on this point, as the cottagers' and amateurs' exhibits, while being numerous, were also of high quality when the smoky district and other difficulties are taken into account. Surely these are the localities in which flower shows and cottage gardening should be encouraged. J. C.

LEICESTER FLOWER SHOW.

AUGUST 1, 2.—Hitherto this popular midland show has been held on the first Tuesday in August, but this season the committee changed the opening day to Monday, as Bank Holiday is largely observed in the Midlands. The result was a falling off in some leading features, consequent upon the difficulties attendant on Sunday travelling, and especially in the Rose classes.

The Leicester committee, no doubt, had good reasons for the change of day, but as they are so largely dependent upon exhibitors from a distance, it is a moot question whether it would not be better to revert to the old arrangement of a Tuesday show.

Six spacious tents were required to accommodate the exhibits; the day was brilliantly fine, and there was a large attendance, notwithstanding that there were many other attractions in the town. Rain is badly wanted at Leicester, and especially in the Abbey Park. The heavy soil can be seen cracking in many directions, still the beds and borders are delightfully gay, and Mr. J. Burns' masterpiece of sub-tropical gardening can now be seen at its best.

Specimen plants are not a strong feature at Leicester. What is wanted there is an object lesson in plant exhibiting, but such finished specimens as are met with from Cheltenham can be got to Leicester only through the medium of attractive prizes. There was a class for six specimen plants, of which three were foliage plants. Mr. Blake, the gr. to P. H. MUNTZ, Esq., Dunsmore, Rugby, was 1st, and Mr. H. ROGERS, a local nurseryman, 2nd. Some good Palms were staged; the best specimen plants were Bougainvillea Sandariana, Allamanda Schottii, Statice profusa, and Plumbago capensis alba.

Fuchsias were represented by nice bush specimens, well grown and bloomed. Mr. H. ROGERS was 1st, and Mr. J. WRIGHT, nurseryman, Leicester, 2nd.

Good specimens of zonal Pelargoniums, single and double, formed striking patches of colour. With six single flowered Mr. WRIGHT was 1st, and Mr. G. PERKINS, another local nurseryman, second. The double varieties were better than the single. Here Mr. ROGERS took the 1st prize, while Mr. WRIGHT was 2nd.

Single tuberous rooted Begonias showed well-grown and bloomed plants, the best coming from Mr. WRIGHT, Mr. ROGERS falling behind in this case. No double-flowered varieties were staged. The best plant in bloom was a Stephanotis floribunda from Mr. J. G. HARRISON, Belgrave; Mr. ROGERS came 2nd with Allamanda Schottii; and Mr. G. PERKINS was 3rd with a pretty specimen of Begonia corallina.

Groups.—The class for a group of plants, filling a space of 150 square feet, brought two remarkably good ones, arranged on a square pattern, which now so much prevails, having a centre and side mounds, with a bed of dot plants. Mr. BLAKEWAY was 1st, being richer in all leading respects, his gaily-coloured Crotons being much more effective on the side mounds than the green Palms used by Mr. BLAKEWAY, who was placed 2nd; but both were excellent object-lessons in effective plant-grouping. There were other plant classes, but they contained nothing requiring special notice.

Roses are generally a leading feature among cut flowers at Leicester, but, for the reason already stated, there was a decided falling off; the best blooms came from the home counties; the best thirty-six blooms coming from the Hitchin nurseries of Messrs. HARKNESS & SONS, and included fine blooms of Her Majesty, Madame Eugène Verdier, Comte Raimbaud, Madame Hoste, Madame Delville, Ulrich Brunner, Helen Keller, Etienne Levet, A. K. Williams, Harrison Weir, Comtesse de Nadaillac, François Michelin, Souvenir d'Elise, &c. An extra prize was awarded to Mr. A. G. GREEN, Colchester, who had not complied with the requirements of the schedule.

Messrs. HARKNESS & SONS also had the best twenty-four, which contained the following, in fine character:—Mrs. J. Laing, Her Majesty, Etienne Levet, Fisher Holmes, Alfred Colomb, Madame Eug. Verdier, &c.; 2nd, Mr. A. G. GREEN.

The best twelve Teas and Noisettes also came from Messrs. HARKNESS & SONS, and included Maman Cochet, Souvenir d'Elise, Comtesse de Nadaillac, Innocente Pirola, Marie Van Houtte, and Niphetos; Messrs. J. COCKER & SONS, Aberdeen, were 2nd. The best twelve blooms of any other variety

were those of Mrs. J. Laing, from Messrs. HARKNESS & SON. Mr. A. G. GREEN was 2nd, with the same. The best twelve of any other variety of Tea was Maman Cochet, also from Messrs. HARKNESS & SONS; the Rev. M. JACKSON, Stagden Vicarage, was 2nd, with Catherine Mermet.

There were classes also for amateurs, the leading prizes being taken by the Rev. J. H. PEMBERTON, Haveing, Romford, who showed remarkably good flowers for so late in the season. The best Rose in the show was Her Majesty, in Messrs. HARKNESS & SONS' stand of thirty-six blooms, run close by a brilliant Victor Hugo from the Rev. J. H. PEMBERTON.

Carnations and Picotees were good for the season, Messrs. THOMSON & CO., Sparkhill, Birmingham, taking the 1st prize, for twelve Carnations, twelve yellow grounds, selfs or fancies, and twelve Picotees. These were also shown in classes for single blooms, and in bunches. One collection of twelve bunches of hardy annuals from Mr. W. F. GUNN, Olton, illustrated some of the prettiest for garden decoration.

Banks of Hardy Flowers, filling a space each of 15 feet by 5 feet, were a very striking feature; large and bold bunches were produced in the best condition. It led to a very spirited contest between Messrs. COCKER & SONS, W. F. GUNN, and HARKNESS & SONS, the prizes being awarded in the order named. Delphiniums, Lilies, Lathyrus, Gladiolus, Coreopsis, Scabious, and other leading subjects were seen to the best advantage.

Fruit was not largely staged, but what there was of it was remarkably good. Mr. H. GOODACRE, Elvaston Castle Gardens, Derby, was 1st, with eight dishes, three varieties of Grapes being permitted. He had two bunches each of well-finished Black and Muscat Hamburgs, and Muscat of Alexandria; a good Queen Pine; Royal George Peaches; Pineapple Nectarine; large and beautifully-coloured Lady Sudeley Apples from an orchard-house, and a fine Melon. Mr. A. McCULLOCK, Newstead Abbey Gardens, was 2nd, having the same varieties of Grapes, but staging Madresfield Court in the place of Muscat Hamburg; Goshawk Peaches, Pitmaston Orange, and Lord Napier Nectarines, &c.

The Veitch Memorial Trustees offered their Medal and £5 sterling for a collection of fruits, in eight distinct kinds, two varieties of Grapes being allowed. Here the judges unfortunately interpreted kinds as being synonymous with varieties, and awarded Mr. McCULLOCK the prize, he having in his collection two dishes of Peaches and also of Nectarines. It will be observed that in the wording of the class, a distinction is drawn between the terms, "kinds" and "varieties," which was overlooked by the judges, and they were apparently unaware that the Abbey Park Flower Show is affiliated to the Royal Horticultural Society, and therefore bound by their published rules for judging. They should have disqualified Mr. McCULLOCK, and awarded the 1st prize to Mr. J. H. GOODACRE, who was placed 2nd, and who staged Muscat Hamburg and Muscat of Alexandria Grapes; Noblesse Peaches, Victoria Nectarines, Lady Sudeley Apples, Figs, Melons, and Strawberries.

The best four varieties of Grapes, two bunches of each, were staged by Mr. McCULLOCK, who had well-finished bunches of Madresfield Court, Gros Maroc, Muscat Hamburg, and Muscat of Alexandria; Mr. GOODACRE was 2nd, having Alwick Seedling in the place of Madresfield Court. Mr. GOODACRE was the only exhibitor of a Pine, staging a good Queen. He was also 1st with two bunches of Black Hamburg Grapes, very well finished; Mr. A. J. ELPHINSTONE, Woodthorpe Grange Gardens, Nottingham, was 2nd. With two bunches of White Muscat, Mr. GOODACRE was 1st, and Mr. KNOWLES, Buckminster Park, Grantham, was 2nd. Any other black was represented by Madresfield Court, from Mr. McCULLOCK; Mr. GOODACRE was 2nd with Muscat Hamburg. Any other white was Duke of Buccleuch, which gained the 1st prize for Mr. McCULLOCK; Mr. ELPHINSTONE coming 2nd with Buckland Sweetwater.

The best dish of Peaches was Royal George, from Mr. BLAKEWAY, Dunsmore Gardens, Rugby; Mr. GOODACRE coming 2nd with Grosse Mignonne. The latter had the best dish of Nectarines, staging Pitmaston Orange; Mr. McCULLOCK was 2nd with the same. The best Strawberry was Waterloo; Duke of Edinburgh was 2nd. There was but one exhibit of dessert Apples—a splendid dish of Lady Sudeley from Mr. GOODACRE, worthy a double 1st. The best dessert Plum was Jefferson's, from Mr. GOODACRE. Currants, red, white, and black, were numerous and fine, and there were very fine Tomatos, classed at Leicester among fruits. Bush-fruits in good character were also shown by cottagers.

Vegetables were shown in several divisions; in the class for twelve varieties, open to all, Mr. R. SHAW, Garrendon, took the 1st prize with a very fine collection, and he was also 1st with six dishes of finely-finished Potatos. The special prizes offered by Messrs. Sutton & Sons, Harrison & Sons, C. Warner, James Wright, and others brought good competitions.

Miscellaneous collections greatly helped the general effect. Messrs. W. CUTBUSH & SONS, Highgate Nurseries, set up a very tasteful group of plants and flowers. Mr. LAWSON, gr. to Mrs. ELLIS, Knighton, Leicester, had a charming group of foliated plants and Ferns; Mr. J. H. GOODACRE, a fine group of Malmaison Carnations and Sweet Peas; Mr. H. ECKFORD, Wem, delightful vases full of new and choice Sweet Peas; Mr. H. ROGERS, greenhouse plants and Pelargoniums; Mr. H. DEVERILL, Banbury, a very good collection of cut hardy flowers; Messrs. HARRISON & SON, choice vegetables and Sweet Peas; Messrs. J. R. PEARSON & SONS, Chilwell, had a collection of Gooseberries; Messrs. W. & J. BIRKENHEAD, one of their very interesting collections of Ferns; Mr. J. WRIGHT, hardy flowers; Mr. D. LESTON, the Gardens, Quacksick House, Leicester, some very pretty bunches of violas; Mr. HODGKINS, skeleton flowers and leaves, &c.

— per pot ...	3 0 —		

REMARKS.—The English Queen Pines were very well grown, and I should estimate their weight 8 lb. I have not seen anything like them for a long time. Strawberries will now soon be over. Scarlet Beans and Marrows will now come on fast and prices no doubt will be lower. Cabbage are a little better trade. Peas now come awkward for some buyers; that is, choice quality is not so plentiful; the same applies to Lettuce, they will run so quickly when they get the sun on them. Potatoes appear at present very good; the sieve and half bushel are the same basket, but under some circumstances called by the different names. Egyptian Onions are over.

POTATOS.

60s. to 90s. per ton, John Bath, 32 and 34, Wellington Street, Covent Garden.

SEEDS.

LONDON: August 3.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's seed market, as was to be expected, was thinly attended with scarcely any business passing. Good new English Trifolium is now selling at low rates. The new Dutch Rape seed shows good quality, and meets a steady sowing inquiry, as does white Mustard seed. The birdseed trade is very slow, and there is hardly anything doing in either Blue Peas or Haricot Beans. Other articles at this dull period call for no remark.

FRUIT AND VEGETABLES.

GLASGOW: August 3.—The following are the averages of the prices at this market during the past week:—Apples, Canadian Spy, 24s. to 26s. per barrel; ditto, Russets, 24s. ditto; ditto, Western States (Winesops), 20s. to 22s. do.; ditto, Russets, 18s. ditto; Tomatos, Guernsey, 6d. to 7d. per lb.; Grapes, home, 3s. 6d. to 4s. ditto; ditto, foreign, 6d. to 1s. ditto; Gooseberries, 3s. 6d. to 4s. per stone; Cabbages, spring, 7d. to 10d. per dozen; Cauliflowers, English, 1s. to 1s. 3d. per bunch; ditto, Dublin, 2s. 6d. per dozen; Herbs, 1d. to 2d. per bunch; Mint, green, 6d. to 9d. do.; Onions, 5s. 6d. per cwt.; do., Portugal, 14s. to 15s. per case; Parsley, 1s. to 1s. 6d. per stone; Potatos (best), 1s. do.; Peas, 1s. to 1s. 9d. do.; Cucumbers, 3d. to 5d. each; Lettuces, 6d. to 9d. per dozen; do., Cos, 6d. to 1s. do.; Radishes, 9d. to 1s. 6d. per doz. bunches; Horse-radish, 1s. 6d. per bundle; Mushrooms, 1s. to 1s. 2d. per lb.; Beetroots, 7d. to 8d. per dozen; Spinach, 1s. 6d. to 2s. per stone; Rhubarb, 2s. 6d. to 3s. per cwt.; Turnips, white, 2d. to 3d. per large bunch; Broccoli, 1s. 6d. to 2s. 6d. per dozen; Greens, 2s. per ten dozen; Asparagus, 1s. 6d. to 2s. per bundle; Syllies, 4 1/2d. to 6d. per bunch.

LIVERPOOL: August 3.—Average of the prices at undernoted markets:—St. John's: Potatos, 8d. to 1s. per peck; Peas 8d. to 1s. do.; Asparagus, 2s. 6d. to 3s. per 100; Cucumbers, 3d. to 6d. each; Gooseberries, 1 1/2d. to 3d. per lb.; Cherries, 4d. to 6d. do.; Apricots, 1s. per dozen; Currants, red, 4d. to 6d. per lb.; do., black, 6d. do.; Grapes, English, 5s. 6d. to 3s. do.; do., foreign 6d. to 8d. do.; Pines, English, 5s. to 7s. each. Birkenhead: Potatos, 16d. to 1s. per peck; Peas, 10d. to 1s. do.; Cucumbers, 2d. to 6d. each; Apricots, 9d. to 1s. per dozen; Gooseberries, 2d. to 3d. per lb.; Cherries, 6d. to 8d. do.; Strawberries, 4d. to 6d. do.; Currants, red, 6d. do.; do., black, 6d. do.; Grapes, English, 1s. 6d. to 2s. 6d. do.; do., foreign, 6d. to 8d. do.; Pines, English, 5s. 6d. to 8s. each; Mushrooms, 1s. to 1s. 6d. per lb. North Hay: Potatos, per cwt., Early Regents, 2s. 8d. to 3s. 9d.; Kidneys, 2s. 9d. to 3s. 6d.; Turnips, 6d. to 8d. per dozen bunches; do., Swedes, 2s. 3d. to 3s. 9d. per cwt.; Carrots, 6d. to 8d. per dozen bunches; Onions, foreign, 3s. 6d. to 4s. per cwt.; Parsley, 4d. to 6d. per dozen bunches; Lettuces, 6d. to 8d. per dozen; Cucumbers, 1s. to 1s. 6d. do.; Cauliflowers, 1s. 3d. to 2s. 6d. do.; Cabbages, 4d. to 5d. do.; Peas, 1s. 8d. to 2s. per bushel; Beans, 9d. to 1s. do.; do., Kidney, 1s. 4d. to 1s. 6d. per peck.

NOTICES TO CORRESPONDENTS.

ACARUS: Mrs. W. The Acari are Tyroglyphus longior, probably the commonest of all Acari; it is very destructive to dried and preserved vegetable and animal matter, such as hay, cheese, &c., when it is in large numbers, but it does not usually attack living animals or plants. If the material were baked the Acari would be destroyed. They swarm in most houses and warehouses, but it is only when the numbers become very large that the ravages are usually noticed. Albert D. Michail.

CENTRAL AFRICAN COTTON: W. B., Hamburg. We are unable to afford the information asked for. It is probable that the plant is not a Gossypium but a Bombax, and useless for manufactures.

CHERRIES: Japonica. Regret that we cannot name the Cherries with any degree of certainty.

CUCUMBER: A. Lea. Eel-worms at the root from the loam you have used. Next time, soak the soil in boiling water for an hour or two before using.

ERRATUM: In the notice by "R. D." of Grimstone's History of the Egyptian Pea, see Gardeners' Chronicle, p. 54, July 16, 1898, for Peter Law's & Sons, read Peter Lawson & Sons.

GROUP OF PLANTS, &c.: R. Basil. The decision of the judges, when read in the light of the schedule, should have been, as we think, to disqualify an exhibit that failed to fill the required space by 2 feet 8 inches. The group might have been allowed had the schedule stated that a space of 18 feet by 10 feet was not to be exceeded; whereas in the case stated the area to be covered was definitely stated. Officials may exhibit provided the judges are unaware of the name of the person upon whose exhibit they have to adjudicate.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—M. N. R. Alonsoa incisifolia.—F. E. M. Lycaste leucantha.—Tempus fugit. 1, Cotyledon umbilicus. The Geraniums we cannot name. Send them to some nurseryman who grows them largely, but take care to pack them properly!—F. J. 1, Symphoricarpos racemosus, Snowberry; 2, Acer monspessulanum; 3, Ginkgo biloba; 4, Ruscus aculeatus, Butcher's Broom; 5, Rhus Cotinus; 6, Eriobotrya japonica, Loquat.—J. R. Wotton. 1, We do not recognise it; 2, Koeleria paniculata.—G. T. R. 1, Adiantum capillus veneris; 2, Stenactis speciosa; 3, Polypodium vulgare; 4, Caragana arborea; 5, Cistus Ladanum; 6, Adiantum formosum.—J. L., Bickington. 1, Calycanthus occidentalis; 2, Lychnis chalcidonica; 3, Leycesteria formosa.—Tin Box, no name, no number. The flower Eccremocarpus scaber, Ampelopsis quinquefolia, Alyssum (Königa) maritima.—H. R. S. 1, Umbellifer, not recognised—no fruit; 2, Spiraea ulmaria; 3, Mentha arvensis; 4, Erythraea Centaurium; 5, Prunella vulgaris; 6, Anagallis arvensis; 7, Senecio Jacobaea.

PEACH LEAVES: R. A. Your trees are suffering from what, for want of a better name, we call silver-leaf disease. It affects Plums, Peaches, and Portugal Laurels, either indoors or outdoors, and is very fatal. We believe it is caused by a fungus, but the matter has never been cleared up. It is from no lack of attention on your part. Cut away all the diseased portions, and apply plenty of manure-water in the growing season, so as to strengthen the plant, and allow it possibly to out-grow the malady.

PEAR: Fruit Grower. Your leaves are attacked by the slug-worm of the Pear tree (Selandria atra). The "slugs" will eventually turn into a saw-fly. Dust the leaves with quicklime, or syringe with tobacco-water.

ROSE SHOOT WITH IMPERFECT LEAVES: T. T. The form of leaf sent is not uncommon on plants not favourably situated as regards abundant sunlight; and the fact that plants in more exposed parts of your garden having escaped disfigurement of this kind seems to point to this lack of sunlight being the contributory cause.

"THE BEST KEPT AND CROPPED GARDEN": F. C. In the absence of any stipulation to the contrary, we should certainly look for hardy fruit, as well as vegetables and flowers.

VINES AND VINE-BORDER SOIL: A. B. The samples of soils sent seem to be most unsuitable for the Vine, and that it is so is shown by the samples of roots and shoots. The former are entirely destitute of feeding roots, and are incapable of deriving nourishment from the soil. We do not suppose you can do anything with such soil, and should recommend a new border to be made and new Vines planted. Doubtless the border is a very old one, and it was certainly made of bad materials. The drainage being good, we cannot understand in what manner the wet autumn of 1896 could affect it.

VINE-LEAVES EATEN IN HOLES, AND GRAPES GNAWED: S. Smith. The caterpillar of some kind of Ermine-moth. You might render the leaves distasteful by quassia water; or, what is better, use Richards' XL-All, which kill the grubs and will not hurt the Grapes, and these will be fit for eating a few days later.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, MORE THAN DOUBLED, and that it continues to increase weekly. Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is reserved for reference in all the principal Libraries.

(For remainder of Markets and Weather, see p. vii.)

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 13, 1898.

THE ANXIETIES OF THE ROSE-GROWER.

IF it be true that "uneasy lies the head that wears a crown," I am sure that it is equally true that he who goes in largely for growing and exhibiting Roses, oftentimes finds it very hard to sleep easily under his accumulated cares. There is no period of the year when he may said to be absolutely free from them, whether it be in the depths of winter, in the opening days of spring, or in the scorching suns of summer, he has his worries and anxieties. I think probably his best time is in the early autumn: there are no exhibitions to woo him away from his garden; the show boxes have all been cleaned and put away, and he does not care whether that fine bloom of Marie Baumann or Mrs. John Laing, over whose development he would have watched with much anxiety a couple of months ago, is open next day or next week. But what a time he has had of it this year! we had, it is true, a mild winter, but that brought with it its worries. Day after day he saw the young shoots of his Roses lengthening, and the thought occurred to him, "If this goes on, how will my Roses be about May 20, when that cold wave, whose evil influence we have so often experienced of late years, comes over us?" Then comes the time when he must look out for Rose-maggot and aphides. He has spent many a weary time in hunting out the former, and though it is not a pleasant occupation to pick him out and squash him, he knows there is no other way of circumventing the little beast. And now, after a little time of dry, warm weather, he sees the latter swarming on his trees, he knows their power of reproduction, and therefore must try and get rid of them. At first he is satisfied with the unpleasant task of passing his finger and thumb up and down the shoots, and so destroying his enemies; however, he will soon find that this is not enough, and syringing with a solution of quassia-chips or Gishurst Compound has to be adopted. He does not like it, for it somewhat spoils the foliage of his plants, but he has no alternative. Then, again, what is that he sees on that fine plant of Her Majesty? Can it be mildew? This pest does not affect the permanent health of the plants, though when present in any amount, it certainly disfigures them. But perhaps a more injurious fungus attack is that of the orange-fungus; it is also more troublesome to deal with, as it appears on the under side of the leaves, where it is, of course, very difficult to apply any remedy. In a very short time, the leaves fall off, and the plant is left completely bare; these attacks vary in amount in different seasons and different localities. They are generally ascribed to atmospheric influence (a most delightfully com-

prehensive term, which may mean anything). They form a great source of anxiety to a Rose grower, and it would be a great boon to find out anything which would prevent them. I hear great complaints of them this year, but, strange to say, up till now, the end of July, I have seen but very little of either mildew or orange-fungus on my plants. Where dwarf plants are grown which have been budded on the Manetti or seedling Briar, or more especially on the former, the grower has the anxiety that shoots may start out from the stock, and by the inexperienced may be taken for the Rose itself, until at last the grower is favoured with a large bush of Manetti which has overpowered and killed the Rose.

In a droughty season like the present, there are two sources of anxiety at this time—one is the difficulty of getting the plants in a good condition for budding, for if the bark does not freely rise, successful budding is almost hopeless, so when week after week the drought continues, the anxiety of the grower increases; the other cause for anxiety which the drought occasions is, that the shoots which are thrown up from the underground part of the plants, and which really are the foundations of his hopes for the next season, are very slow in making their appearance. I worried a good deal about mine last year, but then came a thorough drenching rain, just in time to start them off; they came of course late, and had there been a severe winter, such as we experienced two years ago, the effect would have been very disastrous—but as it was, the wood, though not so ripe as one would have wished, was still hard enough to resist the influence of the frost which we did experience, so let us hope that it may be so for the present season.

As I think of the disappointment experienced by all the fruit-growers at the disproportion between the splendid show of blossom and the fruit produced, I am inclined to think a great deal of this is owing to the same cause, namely, the non-ripening of the wood; as I have said, the anxieties of the Rose grower are less in the early autumn than at any other time, for if he has been careful to cut out the weak spindly shoots, which will never bear good flowers, he has very little more to think of, and may look with pleasure on his Teas and Noisettes, which are sure to be in bloom in the autumn, while he may expect some of the high-coloured Hybrid perpetuals to give him flowers which will form a pleasing contrast to the more delicately-tinted Teas.

In all that I have thus written I have made no special reference to the exhibitors of Roses—and who can measure the amount of their anxieties? If the exhibitor be ambitious, and wants to go in for as many shows as possible, I do not think that even a country doctor, with a widely extended practice, has a harder time of it than he has; for during the month beginning from the end of June and ending at the end of July, he must be prepared to do without sleep, except such as he can snatch in a railway carriage or in a waiting-room. He must be on the watch for an early start, and has instructed one or two on whom he can rely to awaken him in time. He must keep guard over his boxes, lest the porters with that charming inattention to all directions, when they see painted in large letters on the box, "this side up," deliberately turn it over the other way. Then, when they come to stations in the dead of night, and can get no access to an hotel, and the waiting-room is closed, all that he can do is

to place his boxes on the platform, lie down on them, and putting his bag under his head for a pillow, snatch a short but troubled sleep, awakened occasionally by a passing train, and obliged to get off to the show-ground as soon as he possibly can. He may come to the station at a very late hour, and knock up the innkeeper, who after opening the door, and seeing a reverend brother with others standing, and seeking for admittance, tells them that they ought to know better, refuses to hear any explanation, and shuts the door in their faces. Nor are these troubles only to be met with in country stations. It is no little cause for anxiety when an amateur comes to the low level at the Crystal Palace, and has to get his box up that long ascent to the central transept. I do not think our excellent president, Dean Hole, is ever likely to forget how some of us helped him up with his boxes at the first show held at the Crystal Palace. And when the exhibitor gets his boxes into their places, his anxiety does not cease: where is the bloom from which he hoped much?—there it stands staring at him, and he must change it. He goes for his box of "spares," and takes out a promising bloom and substitutes it, but he is so excited that he does not see that within a few Roses he has another flower of the same kind, and consequently his box is disqualified. It has, indeed, been seriously questioned whether, owing to this undoubted excitement and worry, and the mistakes engendered thereby, some relaxation of the rule regarding duplicates should not be made. There are, of course, cases where the duplicate may be intentional, but I think generally they arise from the excitement to which I have alluded.

Dean Hole has described in his charming Rose-book the condition of the disappointed exhibitor; but I do not think in these days, when Rose-judging has been so much advanced, that incorrect judging often adds to the worries of the exhibitor. There are some people who never can see that they are beaten. This, which is said to be the characteristic of the British soldier and sailor, is often that of the Rose exhibitor also; but, as a rule, he quietly acquiesces in a decision which is an unfavourable one. He does not think that the judges are in league against him, or that they are "duffers who do not know a Rose from a Cabbage." And now, as I have said, he may for awhile "rest on his oars," and put his anxieties and worries aside for a time. He may go off to the moors, or to the Dolomites, or, if he be an angler, to some favourite river; although in the latter case I am afraid, from what I hear, owing to the lack of water, he will have much worry. However, wherever he goes, let him come back with renewed vigour to face the worries and enjoy the pleasures of another Rose season. *Wild Rose.*

MR. MARTIN SMITH'S CARNATIONS.

THE first thing that strikes one on a visit to "The Warren," Hayes, is the unique disposition of the gardens. The estate borders on Hayes Common, an extensive piece of ground, covered with Brackens, Brambles, Heather (now in bloom), Wood Hyacinths, and other wild flowers that delight to grow on dry soils. From this common there is no visible means of division, so that from the lawns one catches charming glimpses between little groups of shrubs and Conifers, which are brightened by a foreground of flowering plants, of Nature unadorned beyond.

The arrangement is simplicity itself—the art that doth mend Nature.

It moreover comes as a pleasing surprise to find that Carnations, though first, are not everything. The kitchen garden is well cropped with vegetables of high quality; and here grows a large batch of Chrysanthemums, which Mr. Blick considers less strong than usual, but which appears to an outsider to lack nothing. Grapes, especially Black Hamburgh, Gros Colman, and Muscat of Alexandria, are fine, and in the orchard-house, in addition to Peaches well fruited, is a batch of vigorous Apricot-trees ripening a crop of large fruit. All these are growing in pots, and also in pots is a good collection of Pears and Plums growing outside, under the protection of a wire cage—an efficient though expensive method of keeping the fruit from the ravages of birds.

Carnations, however, are the supreme feature; house after house is filled with them, and outside are several batches that have either been condemned to destruction or set apart for border decoration for another year. It must not be supposed the latter are wanting in good qualities. One's feeling is, indeed, that they are good enough for anything, but they are simply crushed out for want of space, which is to be occupied by flowers of a superior quality. The healthy appearance and the abundant foliage of the Hayes Carnations have often been commented on, but no one, without a personal inspection, can realise how healthy and how abundant it is. The blooms, again, are all grown to the largest possible size; this is secured by leaving only a few buds to expand on each stem. Three plants are in each pot, and allowing an average of three blooms to each plant, we have nine to each potful. The effect of a houseful of blooms of such high quality—because, though the blooms are large, the quality is high—is extremely good. Up to the present yellow sorts, perhaps, are the most popular of the self-coloured section, and the finest of these is undoubtedly Cecilia, in shade soft, with petal broad and smooth, and the largest of blooms. Margaret of Anjou, clear in hue, produces a fine flower. On the other hand, Goldfinch is light in shade, pure in colour, and attractive. The Naiad is still lighter, almost straw-coloured, the bloom large and of good quality. Nor must we pass over the Hon. Judith Harbord, a very rich yellow and extra fine; nor Falcon, which is buff yellow and most distinct. Next in popularity to the above are those of which Mrs. R. Hole was not so long ago the sole representative. By far the most brilliant of these is Midas, burnished copper, which, though deficient in one or two of the points so dear to florists, is decidedly the finest of the darker-coloured varieties. I thought it one of the finest flowers in the collection, particularly from the gardener's point of view, as an effective variety for massing and for cutting. Besides this, the only other variety I noted in this section was Benbow, clear fawn in colour, the bloom not large, but of perfect form.

Though it may be said of white-flowered varieties they are endless, there are yet a few superior sorts; such for instance as Helmsman, a large and boldly effective flower; Robert the Bruce, a very pure and full flower, and the habit of growth very dwarf; and Much the Miller, large, pure white, and possessed of a petal perfect in form. Red-coloured varieties are not so rapidly passed over. Here we have not only many fine sorts, but tints differ so much in degree, and the form of the blooms are so varied, that a much larger selection has to be made than in the white kinds. Grand Duke, for example, produces a deep bloom with a splendid petal; Sir Bevis is brilliant crimson, and Ethelbert a clear bright crimson. Comet reminds one very much of the deservedly popular Mephisto, only the blooms are larger, and the habit of the plant dwarfer than in that fine variety. Scarlet forms are represented by Commander, which has a broad and deep bloom; Etna is very bright scarlet; and Conqueror, with large and very full flowers, is bright rosy-scarlet. Rose shades, like reds, are also very numerous, and a selection of the best is not easy to make. Sadek, one of the most popular of the Hayes Seedlings, is surpassed by Joan

of Arc, which strikes one as a fine improvement. Asphodel and Endymion are also very fine, while Flora is lighter in shade; and Euterpe, of a colour somewhat more pronounced, is altogether a fine flower. Orpheus cannot be passed, the bloom being large and of a clear rosy tint. In Miss Sophy Graham we have a very pretty flower, pale pink, reminding one of Campbell's Valkyrie, but much larger. Queen of Scots, large and fine, rosy-pink in colour, is notable for its emission of a delicious clove scent. Note was also made of Dick Turpin, amaranth in colour, and with a large and fine bloom.

From among the many fancy varieties the following are selected as the best. Many of them will be found invaluable by gardeners and others as producers of flowers for cutting, while as summer decorative subjects the plants are difficult, if not impossible, to surpass.

The most attractive of all is Hidalgo, a variety that secured much attention at the Crystal Palace. The blooms are difficult to describe, the coloration, as well as the form, being very distinct. The ground colour is a yellow tint, and the markings maroon, white, and light scarlet, the centre of the bloom being very dark.

In Persimmon we have another flower of great effect, and which by some will be preferred to the last-named. The colours are scarlet, slatey-blue, maroon, and lilac, arranged somewhat like the old bizarres, though, of course, the white ground is absent, and the colours are different. Ossian, with buff-yellow ground, barred rose-mauve and crimson-maroon, is another attractive kind. So also is Perseus, a beautiful flower for cutting. In Queen Bess, a yellow ground, with mauve and purple markings, we find a very fine sort. Britomart, a lovely variety, is striped rose and carmine, while Pagan, buff, suffused with mauve, is distinct and really beautiful. Charles Martel, a dark fancy, with yellow ground, almost covered with scarlet, is very bright. Those who know Prodrick, with its large bold flower and its harmonious colouring, will be able to conceive the beauty of Elaine, the two bearing some resemblance to each other. Heroine, a yellow-ground fancy, with rose and carmine markings, is a most attractive sort, and perhaps more so is Maid of Honour, an extra fine Apricot, ground marked with rosy-mauve, the habit of growth dwarf, and Duke of Alva, yellow-carmine and purple, presents a very attractive combination.

Yellow-ground Picotees are also grown in large numbers. Not a few of them possess with a distinct wire edge pure grounds without marking, but these being under the Hayes standard of size, are being grown on for breeding purposes only. Of those that will in due course be distributed, the following were noted as extra fine:—Carloman, with scarlet edge, and marked with the same colour; Goldilocks, a very charming sort, the bloom tipped lightly mauve and maroon; The Sphinx, buff-yellow ground; Prætorian, yellow, with mauve; Aglaia, primrose, with mauve, the flower very large; Edith, dark yellow ground, full flower, bright rose edge, and extra fine; Lily Duchess, a fine variety, yellow, with rose edge; Lady Bristol, yellow, with dark rose; Mohican, deep yellow, with scarlet edge, is of fine habit, and very free; Mrs. Tremayne, and His Excellency, the latter a very clear-coloured, fine variety.

Malmaisons were practically past. Gog, a "semi-Mal," brilliant scarlet, and Mrs. Martin Smith, darker and larger than the pink Malmaison, being the only sorts in flower. A houseful of show Carnations are also well cultivated. B.

ALTHÆA PRIMROSE GEM.

[SEE FIG. 30, p. 115.]

This very pretty perennial was raised for Messrs. Veitch by Mr. Seden. It is a plant like the Hollyhock, with large clear primrose-yellow flowers, which are very attractive. It was raised from *Althæa ficifolia*, fertilised by the pollen of a garden Hollyhock. It was exhibited at the meeting of the Royal Horticultural Society on July 26.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM SCHLIEPERIANUM CITRINUM.

THIS is a very pretty colour variation of the showy typical form which has yellow flowers, barred with brown. In *O. S. citrinum* the ground colour is pale yellow, and the bars and blotches on the segments of a darker tint of yellow instead of brown. It grows well with its allies *O. grande* and *O. insigne* in a tolerably cool house, a few degrees warmer than that in which *O. crispum*, *O. Pescatorei*, &c., are grown. A good example of it is sent by H. Cary Batten, Esq., Leigh Lodge, Abbot's Leigh, Bristol, who also sends a very richly-coloured *Læla tenebrosa*, the rather rare *Lycaste (Colax) viridis*, with pale-green flowers, bearing purple spotting on the petals, and *Lycaste cruenta*. J. O'B.

ODONTOGLOSSUM HARRYANUM SUPERBUM.

THIS variety, like most of the other members of the genus, varies much, and while all the varieties are pretty enough to grow, there occasionally appears a form which far surpasses the ordinary varieties in every respect. Such a one has been forwarded by H. Cary Batten, Esq., Leigh Lodge, Abbot's Leigh, Bristol. It measures nearly 4 inches across the sepals, the upper one of which is over an inch in width, and the lateral ones rather under an inch wide. The sepals and petals are of a dark purplish-brown, with a few narrow wavy yellow lines. The large broad labellum is orange at the base, claret-crimson, veined with yellow on the middle area, and primrose-yellow at the apex. J. O'B.

The following Orchids are figured in the last number of *Lindenia*, which completes the third volume of the present series, or the thirteenth volume of the whole work, comprising within its limitations a most serviceable series of plates. In the next volume we trust the Editor will dispense with the Roman numerals, and adopt others that do not take so long to read:—

ACANTHEPHIPIUM CURTISI, *Rchb. f.*, var. *ALBIDA*, *Lind.*, t. DCXIX. See *Rchb. f.*, in *Gard. Chron.*, xv., p. 169.—Distinguished from the original by the white perianth segments, flushed with yellow; the lateral lobes of the lip are pure white.

CIRRHOPELAIUM PICTURATUM, *Loddiges*, t. DCXXII.—A beautiful species, which Orchidists will be glad to see is being re-introduced.

CYPRIPEDIUM ROTHSCILDIANUM, *Rchb. f.*, var. *PLATYTÆNIUM*, *L. Lind.*, t. DCXXIII.—A form with remarkably broad petals, and truly one of the most striking of its race.

CYPRIPEDIUM WINCQZIANUM × *Lind.*—A hybrid between *C. Harrisianum* superbum and *C. Haynaldianum*, in the establishment of the "Horticulture Internationale," and dedicated to M. Arnold Wincqz. It is a handsome variety, combining the characters of both its parents.

DENDROBIUM TAURINUM, *Lindl.*, t. DCXXI.—Flowers white, segments twisted, spreading, violet-tipped.

ODONTOGLOSSUM CRISPUM, *Lindl.*, var. *MOOREANUM*, t. DCXXIV.—A variety with segments, white, traversed by a central rose-coloured line, and yellow at the margin; lip white, with a purplish-brown spot.

ODONTOGLOSSUM × *WILCKEANUM* var. *LINDENI*, t. DCXVII.—A magnificent variety, with stellate flat flowers, segments relatively narrow, lacerate, white, with large brownish-purple blotches. The plant is supposed to be a natural hybrid between *O. crispum* and *O. luteo-purpureum*.

PHAIUS NORMANNI × *O'BRIEN*.—A hybrid between *P. Sanderianus* and *P. tuberosus*. See *Gard. Chron.*, 1897, i. 245.

The plants figured in the eighteenth number of the useful *Dictionnaire Iconographique des Orchidées*, dated March, 1898, but not issued for some months after, are:—

CYMBIDIUM GRANDIFLORUM, *Griffith*. *Cymbidium*, pl. 5.

CYPRIPEDIUM TESSELLATUM *PORPHYREUM*. *Cypripedium hybridum*, pl. 14.

DENDROBIUM AINSWORTHII *LEECHIANUM*, *Cogn.* *Dendrobium hybridum*, pl. 1 A.

LÆLIA ANCEPS *HILLIANA*, *Rchb. f.* *Lælia*, pl. 4 C.

LÆLIO-CATTLEYA MYRA, *Veitch*. *Lælio-Cattleya hybridum*, pl. 10.

MASDEVALLIA CHIMERA, *Rchb. f.* *Masdevallia*, pl. 5.

ODONTOGLOSSUM CRISPUM *FRANZ MASEREEL*. *Odontoglossum*, pl. 1 G.

ODONTOGLOSSUM *HARVINGTENSE*, *L. Lind.* *Odontoglossum hybridum*, pl. 4.

ODONTOGLOSSUM PESCATOREI *LEUCOXANTHUM*, *Rchb. f.* *Odontoglossum*, pl. 2 B.

ONCIDIUM CAYENDSIANUM, *Bat.* *Oncidium*, pl. 11.

ONCIDIUM SPILOPTERUM, *Ldl.* *Oncidium*, pl. 12.

SCUTICARIA STREELEI, *Ldl.* *Scuticaria*, pl. 1.

SELENIPEDIUM CAUDATUM, *Ldl.* *Selenipedium*, pl. 1.

ORCHIDS AT THE POPLARS, REGENT'S PARK.

Passers along the Avenue Road, near Regent's Park, noting the massive gates of the pretty and commodious residence of Ludwig Mond, Esq., would scarcely suppose that inside those gates one of the prettiest natural gardens in the suburbs of London

sonal friend, and as much time as he can spare is spent in their company. The lofty Cattleya-house contains a very fine collection of Cattleyas and Lælias, comprising some large specimens of Cattleya aurea, which luckily flowered here out of an importation of *C. Warscewiczii* (gigas). More often than

mens of *Lælia purpurata*, with fine flower-sheaths; *L. tenebrosa* in bloom, and so also varieties of *Cattleya Loddigesii*, &c. At one end of the house are some strong *Cypripediums*, of which some, *C. Charlesworthii*, *C. cœnanthum superbum*, and others, are in bloom. Here, too, is a fine batch of *C. Spicerianum*,

FIG. 30.—ALTHÆA PRIMROSE GEM: COLOUR OF THE FLOWER PRIMROSE-YELLOW. (SEE P. 114.)

was to be found, and that in the glasshouses were cultivated in perfection a fine selection of the rarer showy Orchids. Great interest is taken in the Orchids by Mr. John O. Clarke, the gardener at The Poplars; and in his management of them the fact that the collection has been gradually formed under his guidance, goes far to account for their good condition, for each of the plants he looks upon as a per-

otherwise, however, the experience is reversed, and plants bought as *C. aurea*, on flowering, turn out to be *C. gigas*. *C. Mendeli*, *C. Schroderæ*, *C. Mossiæ*, including that charming light variety, *C. M. Mondii*, are all well represented, their new growths being of great vigour. In flower are some handsome *C. Gaskeilliana*, one specimen, still in bloom, having had a dozen fine flowers. Here also are many grand speci-

fast growing into large specimens, although [when bought they were very small pieces. Mr. Clarke pots all this class of plants of *Cypripedium* in stiff loam, mixed with fine crocks, and the pots soon become a mass of roots. On a shelf overhead is a splendid lot of *Dendrobiums* of the *D. thyrsiflorum* and *D. Farmeri* class, and throughout the house are many examples of very fine culture, especially noteworthy

being the large specimens of *Odontoglossum citrosimum*, and the plants of autumn-flowering *C. labiata*, which promise a good late autumn show. The stages are edged with *Ficus repens* and *Oplismenus Burmanni*; and the lobby at the end, which contains some valuable statuary, is brightened with *Cattleya Gaskelliana*, some noble spikes of that fine old *Odontoglossum hastilabium*, *Miltonia Roezli*, and *M. Roezli alba*, and other flowers.

The *Odontoglossum*-house has a large number of very healthy specimens, a few being in flower; and in the other houses, especially good were a fine lot of *Cymbidiums*, including a sturdy plant of *C. Traceyanum*; a very fine batch of the orange-coloured *Epidendrum vitellinum majus*, the dark rose-purple *Sobralia macrantha*, "Woolley's variety;" *Oncidium Lanceanum*, and other pretty species in flower.

The foggy winters in the neighbourhood of London render it specially praiseworthy to have such a healthy lot of plants in one's care as those Mr. Clarke so well cultivates; and the good crop in the vineries, and the neat condition of every part of the gardens, show that, with skill and care, not forgetting money, gardening may be carried out, even in the suburbs of London. *J. O'B.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 79 to 85.)

(Continued from p. 107.)

2, ENGLAND, N.E.

YORKSHIRE.—Apples are only an average crop in this district. Pears are only a thin crop. Plums are very scarce, Denyer's Victoria being the only one that has a crop. Apricots are carrying heavy crops, and are looking well. *A. E. Sutton, Castle Howard Gardens, Welburn.*

— The great promise of abundant crops of Apples, Pears, and Plums has not been fulfilled; the continued cold and lack of sunshine during April and May were the causes of failure in many places in this district. At Birdsall some varieties of Apples, viz., Keswick Codlin, Blenheim Pippin, Tower of Glamis, King of the Pippins, have fine crops. Pears on east and west walls are a thin crop, whilst some of the trees on south walls have good crops. Plums on walls and standards alike are a very thin crop, and the trees are infested with aphids, and require the insecticide syringe very much. Dessert Cherries on untrained trees are a good crop. Strawberries are excellent; plantations that were made last August of the following varieties are very good, viz., Black Prince, Noble, President, Royal Sovereign, Sir J. Paxton, Gunton Park. *Bailey Wadds, Birdsall, York.*

— The fruit-crop hereabouts is a very disappointing one, inasmuch as the show of bloom all round was as good as it was possible to be, and there were no frosts during the flowering; but strong, cold winds, accompanied by hail and rain, which doubtless caused the lightness of the fruit crop. Of Apples, a tree (standard or bush) here and there is carrying average crops, while others have not any fruits. The same may be said of Pears and Plums on walls. Standard trees and bushes are a complete failure. Plums are very badly infested with aphids. *J. Hughes, Wentworth Woodhouse Gardens, Rotherham.*

— On the whole, the Apple crop is a very partial one, trees of some varieties carrying good crops, and others have none. Many of the Apple-trees are infested by insects and attacked by mildew, which give the trees a dried-up and rusty appearance. Pears are a very thin crop, but the trees are healthy. The Peach, Nectarine, and Apricot-trees have an average crop, but owing to the cold winds and frosts experienced in the spring and early summer months, gumming and loss of branches is much in evidence. *J. Allsop, Dalton Hall Gardens, Hull.*

— The crops of fruit on trained fruit-trees on walls are an average, and so far the fruit is healthy and promising, whilst on standard trees and bushes it is in general very poor. All hardy fruit promised well in the spring, trees, bushes, and plants being covered with blooms, and I believe the constant

light rains, and cold experienced at night, prevented the bloom from setting, and killed the embryo fruits. *Chas. Shaw, Asket Hall Gardens, Roundhay, Leeds.*

— Fruit-trees blossomed abundantly, and during the early spring promised well. Not so much the frost but the continued cold winds just as the blossom was setting, were, I believe, the cause of the fruit-blossom failing to set. Many fruit-trees suffered from blight. *J. P. Leadbetter, Tranby Croft Gardens, Hull.*

— Judging from the quantity of bloom, and the absence of spring frosts hereabouts, we looked forward to a good fruit year; but as far as Apples, Pears, and Plums are concerned, the crops will be very light. The varieties of Apples which have set the best are Devonshire Quarrenden, Lord Grosvenor, Peasgood's Nonsuch, Cox's Pomona, Stirling Castle, New Hawthornden, Tower of Glamis, and Burr-Knot—the latter a never-failing cropper. The crop of small fruits is a heavy one generally, but late in ripening. *S. Upex, Wigganathorpe Gardens, York.*

3, ENGLAND, E.

CAMBRIDGESHIRE.—In the flowering season the fruit crop looked most promising all round with us, the standard Plums, Greengages, and Damsons being a beautiful picture when in bloom, and it was the same on the walls with Peaches, Nectarines, and Pears; but at the setting period the nights were frosty, with cutting east winds, which blackened all the blossoms, as it did those of the Gooseberry-bushes. Our soil is a heavy cold clay. The fly on the walls was the worst attack for many years past. *A. Burgess, Wimpole Hall Gardens, Royston, Cambs.*

ESSEX.—Apples are a good crop; in some cases varieties such as Lane's Prince Albert and Stirling Castle have required thinning. Pears and Plums bloomed well, but in consequence of late frosts they did not set well. Cherries set well, and carry good crops of fine fruit. Peaches and Nectarines are carrying good crops, which promise well, the trees not having suffered so much from blight as last year. Apricots are a good regular crop, fine fruit. Small fruits are an enormous crop, and very good. Strawberries are the heaviest crop I have seen for years, fruit well developed, and of good flavour. *W. Piper, Hylands Gardens, Chelmsford.*

NORFOLK.—The fruit crops here have turned out very disappointing, the Apples being very thin and the trees very unhealthy. Pears are better, especially early ones on the south wall, and Jargonelles, Flemish Beauty, Williams' Bon Chrétien, Gifford's Beurré are carrying good crops. Plums are very irregular: trees on an east wall have scarcely a fruit, whereas those on a west wall have a good average crop. Cherries are thin and very small and do not seem to swell as they ought. Peaches and Nectarines are a good average crop, but the trees are much blistered; small fruit is very plentiful and good. *H. Batchelor, Catton Park Gardens, Norwich.*

SUFFOLK.—Speaking generally, the fruit crop in this district is an average one. Strawberries were abundant, and of good quality. This year the fruit was fully a fortnight later in ripening. The following varieties were particularly good:—Noble, Royal Sovereign, Sir Joseph Paxton—still one of the best—and British Queen. Small fruits, with the exception of Gooseberries, are plentiful, but not good in quality. Currant-bushes have been much infested with aphids. Apples promise to be fairly good. *H. Fisher, Flinton Hall Gardens, Bungay, Suffolk.*

4, MIDLAND COUNTIES.

BEDFORDSHIRE.—Apples are a very good crop, clean and neat wood. Pears a very thin crop; the wood, however, is healthy and clean. Plums very scarce, but the trees healthy and making good wood. Cherries good average crop, but a good deal infested with black-fly. Peaches and Nectarines on unprotected walls clean and healthy, but they will be late in ripening. *G. R. Allis, Old Warden Park Gardens, Biggleswade, Beds.*

BUCKS.—The Apple and Pear crops are under the average in this district, and trees of the former are

much infested with aphids. The blossoms were abundant, but showed a weakness, probably caused by the partially-developed state in which the buds remained for about two months from the second week in March, previous to which the buds, especially of Pears, were almost ready to open, owing to the mild weather prevailing up to that date. The result was that the majority of the blossoms failed to set, or were so weak that they soon dropped off. A few varieties have cropped fairly well, one of the best being Lord Grosvenor, the best early Codlin. Peaches and Nectarines are a full crop, and much thinning of fruits has been necessary. Apricots about half a crop. Plums a good average on wall trees, but there are none on standard trees. *C. Herrin, Dropmore Gardens, Maidenhead.*

— Only a few varieties are bearing a good crop, although we had a good show of bloom. Plums are a thin crop. Apples and Pears also under the average. Strawberries good, and late ones very fine, such as Latest-of-All, Oxonian, and Elton Pine. *J. Smith, Mentmore Gardens, Leighton Buzzard.*

— The Apple crop is much affected with fly, and consequently the size of the fruits and the quality will be impaired. The Pear crop varies considerably this year in this locality; the condition now is satisfactory. Plums are very scarce; only here and there is a full crop to be found. Peaches and Nectarines a promising crop on Alexander and kindred varieties. Apricots very few, but fairly good in quality. Strawberries fine in general, that invaluable sort, Royal Sovereign, introduced by the late Mr. Laxton being superb as an early and good variety, and for early work especially, and good for other seasons and for general cultivation. Raspberries: the dry state of the weather seriously damaged this crop on light soils. Currants are much affected and damaged by fly. *G. T. Miles, Wycombe Abbey, Bucks.*

DERBYSHIRE.—The season for Apple, Pear, and Plum blossom, was the worst I ever remember during my twenty years' residence in this district. Practically speaking, we have no fruit, large or small, excepting Strawberries, the late frosts having played havoc with everything. The cold nights through June also caused great damage to foliage, and all trees are alike completely smothered with aphids. *Wm. Elphinstone, Shipley Hall Gardens, Derby.*

HERTFORDSHIRE.—The fruit season of 1898, although exceptionally late on account of the cold and sunless spring, has been better for fruit growers than the year of Jubilee. Strawberries, Cherries, and Currants promised magnificently in the earlier stages, and led to great expectations; but blight played havoc with Cherries and Currants, and the drought of July diminished the Strawberry crop, although the latter was much benefited by the rains of the end of June. Apricots were subjected to severe storms of sleet and snow when in blossom, but, thanks to the protection of nets, escaped without injury. Plums were nipped in the early stages, and consequently crops are scanty. Apple crops are good and plentiful, and expectations will be realised as regards quantity. *Wm. Garman, Frythesden Gardens, Great Berhampstead, Herts.*

— Apples, Pears, and stone fruit-trees gave great promise, blossom being most abundant, but during the setting period cold and wet weather prevailed, with frosty nights, and the results are with Cherries and Plums in many cases a complete failure. Apples are partial, some kinds, notably Laue's Prince Albert, Cox's King of Pippins on Paradise stock are being thinned. Pears on walls, and where protected, are an average crop; on bush and standard trees in the open very few fruits can be found. *Ed. Hill, Tring Park Gardens.*

LEICESTERSHIRE.—The fruit crops in this district are generally below the average, Apples, Plums, and Cherries are badly infested with blight. Fruits on walls are a good average crop, excepting the Plums. Apricots where well protected have fine crops, requiring much thinning. Gooseberries and Red Currants were badly infested with saw-fly grub, and also with aphids in places. *W. Silk, Rolleston Hall Gardens, Leicester.*

— There was an abundant show of hardy fruit-blossom. The long duration of cold north-east winds of May was disastrous to the Apple crop. The following varieties are, however, carrying full crops:—Annie Elizabeth, Bramley's Seedling, Frogmore Prolific, Seaton House, Bismarck, Lane's Prince Albert, Schoolmaster, Warner's King, Stirling Castle, Northern Greening, King of Pippins, &c. Pears on pyramids are thin, Louise Bonne, Williams' Bon Chrétien, and White Doyenné, being the best; wall-trees fruiting more abundantly, Apple and Pear trees being clean and healthy; Plum trees much blighted, particularly so Damsons. *D. Roberts, Prest-wold Gardens, Loughborough.*

— Apples flowered abundantly, but only the surest-bearing kinds, such as Bramley's Seedling and others, have a crop; many trees have not any, and all are much infested with aphides, mildew, &c. Pears flowered well, but did not set a full crop; they are clean and healthy, but the fruit will be late in ripening. Plums on walls have a fair crop, but have suffered much in the foliage from insect attacks; standard trees are without fruit. Damsons are also a failure. Peaches have a good crop, and are clean and healthy. Apricots set a heavy crop, and are doing well. Strawberries are large and good, and a good crop; a few of the flowers were destroyed by frost on June 15, when the thermometer registered 28°. Gooseberries are clean, and a good crop. Currants a heavy crop. Cherries set a heavy crop, but many of the Morellos have fallen, owing to incessant attacks of black aphid. Filberts also are full of aphides. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

— All standard Apples much below the average, dessert: Pyramids over good, including Cox's Orange Pippin, Ribston Pippin, Pike's Pearmain, Rosemary Russet, Braddick's Nonpareil, Worcester Pearmain, Beauty of Bath, Waterloo, and Stanton Besspool; cooking: Duchess of Oldenburgh, Frogmore Prolific, Lane's Prince Albert, Newton Wonder, Peasgood's Nonsuch, Bramley's Seedling, and Stirling Castle. *Alfred Hamshire, Beaumanor Gardens, Loughborough.*

NORTHAMPTONSHIRE.—The season that promised to turn out well has practically turned out a failure. Nearly all fruits showed well, but cold winds and cold rains brought on such a deal of blight, and the hailstorm, June 28, caused the fruits to fall from the trees, such as Apples and Pears. The Peach-blister has been very bad. *H. Kempshall, Lamport Hall Gardens, Northampton.*

OXFORDSHIRE.—Apples, although the trees were blighted a good deal, are a good crop, and a marked improvement on last year. Pears are very promising on walls, especially on cordons; on pyramids and standards they are not so regular. Plums: the foliage and young shoots were blighted and curled a good deal, but we have an average crop; Victorias are very heavy. Cherries are the worst crop; it has been most difficult to deal with the black aphid. Morellos, which generally do so well here, will be much below the average. Peaches and Nectarines are good; the blister that crippled them last year has hardly made an appearance. *George Stanton, Park Place Gardens, Henley-on-Thames.*

SHROPSHIRE.—Apples are plentiful in places, in others more or less scarce. In my own case, I have a fine lot on trees planted ten years ago, and which comprise the following varieties:—Cox's Orange Pippin, King of the Pippins, Bramley's Seedling, Lane's Prince Albert, Pott's Seedling, Hawthornden, Tom Patt, Waltham Abbey Seedling, Ribston Pippin, Dumelow's Seedling, Nonsuch, Scarlet Crofter, &c. Peach and Nectarine trees are sadly blighted, and crop very partial. *F. S. Kemp, Broadway Gardens, Shifnal, Salop.*

— Plums on wall-trees only are heavy crops. Apricots began to bloom the last week in February, which is earlier than I ever knew them. Peaches began to ripen early, I gathered the first of Alexander and Waterloo from the open walls July 11. The following Apples are bearing the best crops: Blenheim Pippin, Orange Pearmain, Ribston Pippin, Brownlee's Russet, Winter Greening. *G. Pearson, Attingham Gardens, Shrewsbury.*

STAFFORDSHIRE.—The prospect of an abundant crop of most kinds of hardy fruit at the beginning of March has been falsified. The long spell of uncongenial weather which was experienced, commencing as it did at the beginning of March, and continuing, with very few exceptions, until the end of May, upset most of our hopes. Although we have not had such severe frosts this season as in some years, still I think the extreme cold wet weather for such a long period was more generally destructive. This season scarcely any kind of hardy fruit has wholly escaped the bad effects of the bad weather. Of Pears some few varieties have enough left to make a middling crop, while others, such as Williams' Bon Chrétien, Marie Louise, General Todtleben, Duchesse d'Angoulême, &c., are fruitless. Curiously enough many of the trees thus stripped are now showing quite white with a second lot of blossoms. Pear trees on walls escaped the effects of the cold winds, and in most cases are carrying fair crops. Apples, I think, have suffered more than Pears, the large orchard trees, with one or two exceptions, having scarcely any fruit upon them, although in their season the trees were covered with fine healthy blossoms. Young standard trees, about 100 in 50 varieties, which have been planted six or seven years, and in a rather exposed position have, on the other hand, been able to retain a very fair crop. Trees of Lord Suffield and Duchess of Oldenburg in one garden are carrying a medium crop of fruit, while similar varieties growing a little distance off in another part of the garden have scarcely a fruit left, notwithstanding the fact that the former are in the most exposed position. Espaliers and cordons generally are more satisfactory, Scarlet Nonpareil being the only variety out of twenty-four which has entirely failed to set any fruit. Plums and Damsons, which failed last year with us, are again in a similar plight, not one out of the many varieties having more than a stray fruit or two on, although previous to the cold storms the trees were white all over with blossom. Sweet Cherries have middling crops, while the Morellos are well laden with fruit. Apricots, although well protected with shading material, have set but a poor crop, while Peaches and Nectarines are a complete failure. Portugal and Pear-shaped Quince-trees growing together, and both varieties well furnished with blossom in their season are now showing very different results; for, whereas the trees of the first variety have set a full crop, the latter has scarcely a fruit to be seen. Medlars are also well furnished with fruit. The various kinds of bush-fruit present a much better appearance as to fruit than could reasonably have been expected, as during the time they were in bloom we were experiencing very sharp winds and frequent snow-storms, with several degrees of frost at night. Gooseberries are a very good crop. Red and white Currants ditto; while the trees of the black varieties are so heavily laden as to necessitate the looping-up of the branches. Strawberries look very promising, although late, Laxton's No. 1, the earliest variety we grow here, having a few fruits ready to day (June 28); Royal Sovereign and Gunton Park have set large quantities of fruit, and are swelling up well, so also are the later kinds as promising, especially Latest-of-All and Waterloo. To show the lateness of the season compared with 1897, I find we are fully three weeks later in obtaining runners this year than last. Raspberries are setting a heavy crop, the earliest fruits showing well. Blackberries have pushed out strong fruiting laterals, and from which we shall expect to gather large quantities of useful fruit in due time. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent, Staffs.*

— I think I never saw Apple and Pear trees so full of bloom as they were here, and I have very seldom seen so thin a crop of fruit. King of the Pippins on the Paradise stock is the best cropper we have; we have a fair crop of Lane's Prince Albert and Manx Codlin. All other varieties are very thin indeed, and most of the fruit was severely bruised by a hailstorm we had, on June 18, and still show the effects of it. Gooseberries are a heavy crop, so are Currants; Strawberries a fair average crop; Cherries and Raspberries are very poor. *J. Wallis, Keele Hall Gardens, Newcastle, Staffs.*

WARWICKSHIRE.—From the promising appearance of the trees in early spring we anticipated an extraordinary fruit year, but our hopes were again doomed to disappointment. The cold weather in the early part of May, and less or more up to June 15, when we had 3° of frost, settled the bloom or embryo fruits on many trees and bushes. The very late flowering Apple, Court Pendu Plat, which we thought had passed safely through, was caught by the June frost, with the result that the trees are almost fruitless. Apricots are thin, but the fruit now maturing will be very good. Plums, after throwing a profusion of blossom, are perhaps the most disappointing of all. Apples are but a partial crop, but on a few trees planted in 1889 there are a few redeeming points; these are King of the Pippins, Kerry Pippin, Ribston Pippin, Blenheim Orange, Keswick Codlin, Schoolmaster, Cellini, Dutch Mignonne, Reinette du Canada, Northern Spy, Small's Admirable, Prince Albert, and Lemon Pippin. Pears are much less satisfactory, and although there are a few swelling off, they are not good enough to call for any special note. Dessert Cherries have been very good, but much affected by black-fly. Our altitude is 250 feet above sea level. Soil, a healthy brown loam on the red clay formation of the district. *W. Miller, Coombe Abbey, Coventry.*

(To be continued.)

SOME DEVONSHIRE GARDENS.

HAMSLADE HOUSE.—Some excellent blooms of *Romneya Coulteri* and other rather rare herbaceous plants were recently shown at the Bampton Horticultural Society by Mr. James, gr. to — Macalister, Esq., Hamslade House. These were not in the competitive classes, but were specially commended, and much admired. Ascertaining the plants whence they were cut were within a reasonable distance, I made a journey on the following day, and was well rewarded for my journey. I was taken over the whole of a delightful garden by the proprietor and his wife, and had the pleasure of seeing many choice plants in a satisfactory condition. Alpines and herbaceous plants are largely grown, and as the ground is of an uneven character, it lends itself readily to the formation of beds, rockeries, snug nooks, and spots just suitable to herbaceous and alpine plants.

The plants of *Romneya* at Hamslade are so placed that they are protected from cutting winds, and the soil is light and porous. One plant is 6 feet 9 inches in height, 6 feet through, and has over thirty leading shoots, with over 200 flower-buds yet to open. In one year 180 blooms expanded, last year 300, and this year the latter number will probably be exceeded. I had never seen such a plant, nor imagined it could be grown so strong, and flower in such an abundant manner. Here it was in health and vigour, like a rampant-growing *Delphinium*. The lovely white satiny petals fully expanded, and tuft of yellow stamens, stamp this as a flower of uncommon excellence; and since it can be grown so well in favourable spots, I trust others will secure a plant, and grow it as successfully.

Another plant in a border close by was *Eremurus robustus*, now gone out of flower. The plant had been very fine, as was apparent by the remains of the six flower spikes, seven feet high, bearing round seed vessels. Close by was *Scabiosa caucasica*, covered with its pale blue flowers, whilst the *Phlox* and *Delphiniums* were robust and floriferous to an unusual degree. A large number of varieties of Sweet Pea were also in flower, and as each is kept separate the distinctness and purity of colour is retained. In the greenhouse were fine plants of show and zonal *Pelargonium*, furnished with very fine flower trusses. Standing among these were several plants of the rare African daisy, *Gerbera Jamesoni*. The flowers of this plant were shown at the meeting of the R.H.S. on March 9, 1897. This year it is flowering very freely again, and will continue to produce flowers till later in the season. I send a bloom for your inspection. The long flower stalk and singular star-shape flower of a deep red, stand well above other plants. *Cypripedium*

spectable and *Calceolus* in the rockwork were very strong, and had recently gone out of flower, and some two months earlier, when the Alpines and rock plants were blooming, this part of the ground must have been very attractive. I was greatly interested in what I saw, for the lady had every plant's name immediately at hand, and some incident in many cases connected with its acquisition and earlier attempts at successful culture.

MIRAMAR, EXMOUTH, THE SEAT OF J. GORDON, ESQ., is situated about a mile from the sea-coast on high rising ground, and in the vicinity of a number of recently-erected villas, which add much to the importance of this pleasant sea-side town, many of the houses being in the occupation of business men who journey backward and forward to Exeter, finding in these pleasant scenes a great relief from the dust, bustle, and oppressiveness of days spent in the city. From this spot the English Channel is in full sight, and the sea views obtained on the south Devon coast are often uncommonly beautiful. The mildness of this spot during the winter is such that many tender things will remain out in the beds, and suffer no harm whatever. I saw a few days ago on the lawn a grand plant of *Phormium tenax* that had stood a number of winters unprotected. This was now in flower, and had produced twelve spikes some 8 feet in height, flowers of singular form and colour, each being perfectly developed. Standing apart from all other plants, this had a quaint yet singularly interesting appearance.

In a border close by, a grand mass of bedding *Pelargonium* was in full bloom. These were planted some fourteen months ago, had remained unprotected all the winter, and were literally a dense mass of bloom. The same may be said of some *Verbenas*; so early to see large spaces of border covered with the rosy-pink, purple, or crimson colour of these was a pleasure. *Lilium lancifolium album* in the *Rhododendron* beds were well advanced, and would shortly be in flower.

In the conservatory adjoining the mansion, among other useful things were two immense plants of *Doranthus Palmeri*, and at one end a large portion of the space was covered with the old *Pelargonium*, Rollisson's Purple Unique. This had not come under my notice for many years; once again to see its pale purple clusters brought up memories of a firm now no more.

In the kitchen garden, which, however, is not large, a capital lot of cordon fruit-trees were well laden with fruit, a number on an archway being thinned just at the time of my visit. Capital pyramid Apple and Pear-trees were in most cases bearing good crops, Thompson's, Doyenné du Comice, and Van Mons. Léon le Clerc, among Pears, being especially good.

In the several glasshouses were good plants of *Cattleya gigas*, one with ten flowers, others with but one or two less; some well-flowered *Cattleya Warneri*, *C. Mossiae*, and others; *Lælia purpurata*, the pure white *S.* and *P.* form; *L. tenebrosa*, a variety of deep colour; *Cypripediums* in variety; and well above many others was the old but beautiful *Oncidium flexuosum*. Among Ferns, Mr. Ide, the gardener, has some excellent specimen *Adiantums*; and a plant of *Gymnogramma chrysophylla* measures just 6 feet through.

Passing out of these grounds, I was arrested by a fine specimen of *Benthamia fragifera* full of flower, an object seldom seen, yet most beautiful and attractive. The absence of rain, however, is already causing many plants to show signs of giving up. Some good showers will give a fresh face to everything, and carry flowers and plants well through the season.

STANDARD PEACH TREES.

One is so accustomed to see Peaches and Nectarines grown where support can be given to every branch and shoot, either by fastening to walls by nails, or by tying on to wired walls and trellises, or as espaliers in the centre of fruit-houses, that the thought of growing them as standard trees seldom enters into the mind, and the opportunity of seeing them growing so still less often presents itself. One such, however,

came to me a few days ago, for being in the neighbourhood of Exeter, I was induced by a gentleman knowing the district well to visit the gardens of the late Dr. Woodman, now in the occupation of F. R. Hearn, Esq. As this garden had been connected with the previous occupiers, Messrs. Lucombe, Pince & Co., it is hardly necessary to say more than that every part of the garden was in excellent keeping.

Standard and pyramid fruit-trees were numerous, and bearing good crops of fruit. Among the Apples I noticed a fine tree of Cornish Gilliflower, full of fruit. Some in this district contend that this Apple cannot be depended upon for fruiting if the spur system of pruning is adopted; true, there are those who merely thin this tree, and leave the lengthened shoots, at the extremity of which the fruiting-buds mostly appear. In the case of the tree in question, the gardener, Mr. G. Hanning, prunes rather severely, and secures the shoots on short spurs; there are at present such clusters of young fruit that it is evident, in this case at least, the right method is adopted. The same may be said of Ribston Pippin, full of fruit, and the trees remarkably free from cancerous growths.

Just at the entrance to the Peach-house I noticed a large plant of *Aralia Sieboldi variegata*, full of vigour, the variegation being very marked. This plant had stood in its position for a number of years, and has had no protection at all during the winter-time. It certainly had stood all kinds of weather well, and is now as healthy as it is possible to be. We then passed into the Peach-house, and truly a remarkable sight presented itself. The house is about 60 feet in length, and 14 feet in breadth, and the same in height. A number of Peaches and Nectarines are grown on the back wall, and a row of Tomatoes on the front of the house on a low stage. The Peach-trees, of which I think there are ten, were originally, some twenty years ago, I should suppose, grown in pots, and stood on the middle-bed, fastened to pillars in the centre of the house. Through the changes of occupancy and other causes, these have remained in their places, the roots working through the pots. Afterwards, these were broken, and soil put around them, into which the roots quickly entered. The original pyramidal form was soon lost; and now veritable trees, just 14 feet in height, with branches wide spread, so that as one passes through the house, a fair amount of stooping must be exercised, otherwise, one's head will come in contact with branches literally laden with fruit. There are now on these trees hundreds of fine fruit, and if not quite so dark on the outer skin as those grown on front trellises, where, by the pushing aside of the leaves, and consequent exposure to sunlight, a deep rosy tint is spread over the uppermost side, still, on these trees the fruit is of capital size and excellent flavour, those on the higher branches at least as good in colour as the most exacting could desire. Dymond was just finished; of Royal George, two or three trees were so laden that the branches were suspended with thick cord from the roof, or the weight would break them off. Early Alfred, as full as any; whilst that delicious though seldom seen variety Sulhamstead was as densely covered as any. Truly, a lot of which one might be proud, and ere I left I had the pleasure of congratulating the proprietor on his success, and trust it may be the same for many years to come. W. Swan.

MARKET GARDENING.

HARDY FRUITS.

(Continued from p. 90.)

APPLE-TREE PLANTING.—Having fixed on a site we may now proceed to plant it. Here a caution is most necessary, many good trees are ruined by careless and deep planting; many growers to save trouble and expense in staking, &c., bury their trees, this more than anything induces rank growth, and as a consequence unripe and barren wood. I would rather see the fork of the roots where it joins the bole left above the surface than buried. Indeed, in wet cold soils I universally

advise the surface-soil to be gently forked up, and the roots of the young tree to be spread upon this previously forming a small mound, like a mole-hill, and then add little by little some good fresh soil, with which a little well decayed manure has been incorporated, to be heaped up over the roots until efficiently covered giving the tree a gentle shake so as to settle the earth around and among the fibres. Then all may be gently trod up, but do not prune at first planting, except to remove any broken or bruised shoots. Stake at once so that the tree be not injured by the winds of winter, for planting should be done early in November, even if the foliage has not all been dropped, as planting a tree then you may tell it to grow, but later you must ask it—as the old saying goes. The stake should not be inserted nearer than a foot from the base of the tree, and should be so placed that it forms an acute angle with the stem. But the above is an exceptional thing, as a rule young trees want planting. To prepare for this, remove all coarse tap-roots; and any that have been injured by lifting at the nursery should be taken cleanly off by a sharp knife. Now dig the hole, taking care that it is quite large enough to contain the roots without cramping them. I have found it an advantage to form a little mound of soil in the centre of the hole, to occupy the fork of the roots, and so allow the small fibres to float evenly round, and occupy the space allotted.

Now add some of the finer soil, and with a stick work it well among the roots, adding a little at a time, and when the roots are covered, just gently shake the tree, before finally treading up, that the spaces not filled with soil may be so occupied; then mix some well decayed manure with the remaining soil, fill all in, and then gently tread up. Finally stake and tie, using two stakes if the situation be at all exposed to strong winds. After this little more is needed but just to keep an eye on the young plantation, to see that the wind has not shifted the stakes, or shaken the ties loose. Note, I do not advise any swathing material to prevent rubbing, as this so often harbours injurious insects, or their eggs, but use three-ply jute tar-cord, which is soft and yielding while at the same time it is strong and effectual.

Remember that starting well and fair ensures half the victory in most cases. Distance from tree to tree must vary with the kind cultivated, but for standard Apples on grass 20 to 24 ft. apart is ample, taking about ninety trees to the acre, while the intermediate space can be occupied for a time with bush-fruits, or Strawberries, removing these as your trees get large enough to fully occupy the allotted space, but whatever the undercrop taken, use great care not to approach the permanent trees too closely, or to cultivate too deeply. Never prune when planting, but leave the tree as it comes from the nursery, merely taking off cleanly any broken or bruised shoot at the time the roots are attended to. And if you wish to make a finished and slightly job, do not attempt a mixed orchard, that is, if possible, plant a complete row of one kind, for it must be borne in mind that the habit and growth of various trees differ quite as do the shape and colour of the fruit. By no means act as did a friend of mine, a road-surveyor, who being desirous to plant all his trees to one dead level, placed some on the surface, and buried others some feet below the ground-line!

Trees have their individuality, like human beings, some growing erect and compact as the Kerry Pippin and Worcester Pearmain, while others are pendulous and spreading—instance, Cellini Pippin and Yellow Ingestrie, called by Londoners Golden Pippin. Again, some trees are vigorous, others of slow growth; this I have found determined by their early and free cropping habit, which tends to arrest growth. Finally, a characteristic of some kinds is to produce most of their fruit on the ends of the branches, in which case a merely moderate wind, when they are maturing, threshes them down, or so bruises them that they are not fit to market, Lord Suffield and New Hawthorden being two among many that occur to me; while others make most of their fruiting-spurs along the sides of the main branches, as does the grand new kind which came to us from the Antipodes—"Bismarck." In this case the fruit is very much protected from wind, and also much shaded

ch must not be forgotten in pruning, and will be en under that head.

The following year—March to April—the young es may be pruned-back; one golden rule for this endeavour to form your tree, whether a standard a dwarf, with an open and cup-like head, as this ures a maximum of sunlight finding its way into and so gives you good ripe wood, a most portant factor in successful fruit-culture. Take the young shoots of your tree, therefore, so t you secure an outside bud, just above the cut, l remove altogether any thin weakly wood, any shoots that have a tendency to occupy the

to be laid down with safety. The chief thing is to endeavour to form your tree before you let it fruit, or this important result may be retarded, or even in some cases altogether delayed, and your trees become prematurely old and stunted, this being too frequently the case with early-fruiting kinds, such as Mr. Gladstone and Worcester Pearmain, both the Hawthorndens, Stirling Castle, and Ecklinville Seedling, which are so precocious that they may often be seen fruiting in the nurseries on 2-yr., or in rare cases, 1-yr.-old wood from graft or bud.

Before giving a list of the sorts I advise to plant, let me say a few words about marketing. In Kent

ditions requisite to induce the insidious disease commonly called canker, as well as giving lodgment for another Apple-tree pest, the American-blight (*Aphis lanigera*). Therefore do not hand over your first two or three crops at any rate to their tender mercies, but let your own men, or women (for this work is well done by the latter), carefully gather the fruit. *Experience.*

(To be continued.)

HIPPEASTRUM VITTATUM.

OUR illustration of this plant—otherwise, *Amaryllis vittata*—fig. 31, was prepared from a photograph, obligingly sent us by Mr. H. W. Gray, head-gardener at Hempland, Lowestoft, Suffolk. It is the best and most floriferous of the old species grown in gardens, very sweet, and by far better for decorative purposes than the expensive few-flowered new varieties. The flowers are white, with a red band on each segment. The sender tells us that the plant has flowered as profusely as is seen in the picture for several years past, and it has remained undisturbed in its 10-inch pot for some years. There are four flowering-bulbs, seven scapes, and thirty-eight flowers. The species is figured and described in the *Botanical Magazine*, t. 129.

LATE STRAWBERRIES AT MAIDSTONE.

IN continuation of my former notes (see p. 53), I proceed to report on the later kinds of Strawberries grown here; and my remarks on Eleanor and Elton Pine being most reliable have proved correct. Some three weeks of hot, drying weather has tried the beds very much, and those varieties which can endure such a trial are especially valuable. Elton is rather sharp in flavour, but its bright colour and grand crop make it valuable, and sugar is cheap; while, being red all through, it is a grand fruit for bottling or making jam. Eleanor produces a profusion of large, handsome fruit, and though acid, is very pleasant with sugar. Both these do best on rather heavy soils, and special pains should be given to these and all late varieties of Strawberries, by an extra heavy mulching and copious applications of water, with some fertiliser added, before the fruit swells finally. This extra care will then secure some handsome fruit at a time when the hot weather makes it doubly acceptable.

Aberdeen Favourite is a coarse, bright-looking fruit, of use where quantity is desired for cooking or making ices, it being a free bearer. New Dumbarton Castle has proved a splendid mid-season fruit, of excellent flavour, and being a round berry, it ripens well, and is an admirable variety. Waterloo is giving a few large fruits, but is never a heavy bearer here, but its blackish fruits are handsome; still, I do not think that when the newer kinds raised from it are plentiful, we shall require to grow it. Latest-of-All has been very good; indeed, its only defect is the green point, which takes so long to ripen that the berry loses flavour. Under a cool wall, where it can be netted, it is of better quality than where fully exposed; it, however, requires high culture. It is a pity that its name is Latest, as it misleads buyers, there being several later. Countess has done very well, and holds out yet. Veitch's Perfection has given a few highly-flavoured fruits, but we are of the opinion that Carmichael's crosses will supersede it, as they, under the same treatment, are two or three times as vigorous and of equally fine flavour, enormous croppers, and much larger, even when no special care or manure has been granted them. Newton Seedling deserves the Award of Merit it received. Although the flavour is not first-class, its crop and late bearing make it a desirable sort; even in light land the plants are 2 feet across. Frogmore Late and Filbert Pine are for flavour indispensable, but the latter requires less care in culture. Walluff is promising as a half late kind, but it would only be appreciated by those that like a fruit with some acidity.

A word now as to Mr. Carmichael's crosses. Although the raiser does not consider W. Carmichael worth

FIG. 31. HIPPEASTRUM VITTATUM: COLOUR OF THE FLOWERS WHITE, WITH A RED STRIPE ON THE SEGMENTS.

centre of the tree. After this but little more life-work will be needed, but the trees must be overlooked from time to time to see that the branches are free, and not crossing or rubbing against others, as this will surely induce canker and other ills that are fatal. The second year, if all has gone well, the number of shoots to shorten or remove will be more than doubled; but these may have more buds left, say, from five to seven, according to the vigour of the sort operated on, retaining an outside bud as before. I am not a great advocate for such pruning of orchard standards, and therefore say, after this leave Dame Nature to do the rest. Many may demur at the waste of time and labour, but let the fruit-grower make his own decision as to this, as I fear there is no invariable rule

and Sussex, where the Hop oasts afford a ready-made and convenient storage, it no doubt pays best, especially in certain seasons, to store and wait for a favourable market; nevertheless, as a rule, it will answer to gather the fruit, just as it approaches maturity, and to at once pack it and consign it to your salesman; or even a better plan is to sell your fruit on the trees (which is the rule in Kent) to a fruit-dealer, either by auction or privately, and so let him bear the expense of providing baskets, gathering, and marketing the fruit. The drawback to this is, there are unscrupulous buyers to whom you may sing in vain, "Dealer, spare that tree," for in their hurry to get off the fruit many will break and bruise the branches of your trees without compunction, thereby providing the con-

keeping, with me it is a remarkable bearer, of intense, full hautbois flavour, and on a poor piece of land the fruit is of fair size and, I think, far better than Filbert Pine; but it will be further tried. The fruit, of orange-red colour, is produced on long trusses. In Queen of Denmark we have a grand addition; the habit is close and vigorous, and it crops enormously and successively. Its fruit is small to middle size, black, with brown seeds, and its appearance does not recommend it; but culture will make it pay, and next year we hope for larger fruit. Its flavour is exquisite, and Veitch's Perfection will, I believe, take second place by comparison. Britannia (Carmichael) is more nearly like Waterloo, but a better grower, fine in flavour, and a free cropper. This was also on poor land. I think that with cultivation this variety will take a front place as a very late bearer. These three novelties are not yet in commerce, but Mr. Carmichael kindly sent me trials; his Richard Gilbert, as shown at the Royal Horticultural Society, was very large, but I and others considered it to be a reversion to Competitor, which has been discarded as too soft and flavourless for culture. *George Bunyard.*

FLORISTS' FLOWERS.

CARNATION ISINGLASS.

THIS is the very fine rich, deep scarlet variety for which Mr. Salter, Mr. T. B. Haywood's gardener at Reigate, so readily obtained an Award of Merit at the Drill Hall on July 26. Being in the neighbourhood on the 30th ult., I called in at Woodhatch to see the variety at home. I found it better in pots under glass in very brilliant form, and by scores planted out in beds in the garden. Those who eventually obtain plants may be assured that they will get a very sturdy, robust variety of first-class border habit, giving plenty of grass as well as bloom. Indoors, the average height is 2 feet; outdoors, about 20 inches. The flowers are exceptionally large for a variety that does not burst its calyx, and has such fine broad petals and form. Without doubt, amidst the shoal of novelties that is constantly cropping up, for seedling Carnations are now produced annually by hundreds of thousands, though few may be the first-rate ones, this brilliant scarlet is one of the very finest. That it will be in great demand for market culture there can be no doubt. It is well worthy of a more fitting name. I learn that the stock, which will be a considerable one, if time can be spared to get all layered, will be divided between Messrs. J. Veitch & Sons and Messrs. G. Bunyard & Co. There is both indoors and out at Woodhatch a fine collection of named Carnations, amongst which the Yellow Germania is prominent, and still seems to be the very best of its colour. The soil is here naturally sandy, and Carnations seem to like it. In another garden near, there are hundreds of plants flowering profusely, and the borough of Reigate now has its Carnation Society and annual exhibition. *A. D.*

AMERICAN NOTES.

THE ASPARAGUS RUST.

ASPARAGUS has not been subject to serious fungous diseases in this country until within the last two years. In September, 1896, however, Dr. B. D. Halsted, of the New Jersey Experiment Station, sent out a circular calling attention to a serious outbreak of the Asparagus-rust in his State. This was found to be caused by a fungus, *Puccinia asparagi*, described by De Caudolle in 1805, and said to be quite common in certain parts of Europe. It had not been found in America previous to 1896 except in one case, and that was in California; or at least, if it had been found, no record was made of the fact. Since Dr. Halsted's circular was issued, the disease has been recorded in Massachusetts, Connecticut, Maryland, and Rhode Island; and I may add here that I collected it in Vermont about a year ago. I found it the first time I looked for it, and doubtless the fungus is now quite widely distributed in America.

This rust seems to be a serious disease, causing very considerable damage, especially in the large Asparagus-growing neighbourhoods about New York and Philadelphia. Some growers are so much alarmed as to fear they will have to give up Asparagus culture. But so much concern is doubtless unwarranted. After growers have learned how to treat this disease, as they have learned how to combat others, it will not make much difference in the regular garden operations. Extensive spraying experiments with Bordeaux Mixture at the New Jersey Experiment Station succeeded in reducing the amount of rust about one quarter. Dr. Halsted also reports the discovery of two natural enemies of the rust-fungus, namely, *Darlucula flum.* Cast., and *Tubercularia persicina*, Ditt., both of which he thinks will assist materially in checking the progress of the rust. *F. A. Waugh.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Lælias.—The plants of *Lælia autumnalis*, *albida*, *Gouldiana*, and *furfuracea* should be encouraged to grow and to complete their growth quickly, and then be removed to a comparatively dry, cool and well-ventilated glass-house; or, failing that, to a light position near to the glass in the *Odontoglossum*-house. With proper attention as to affording water, &c., the plants will make a large quantity of roots. These growing *Lælias* require water, heat and moisture to be gradually increased, and as they delight in sunheat this should be afforded abundantly, providing the house be well ventilated at the same time; and when the blinds are removed early in the afternoon the foliage should be well wetted with the syringe. Under such treatment the plants make stronger growths than when grown in a close atmosphere in a shady house. Shade is necessary only during the hottest hours.

L. maialis is a beautiful species belonging to this section, and one that is found difficult to manage by some cultivators. Coming as it does from a greater elevation than the preceding varieties, it demands a lower degree of heat, and the intermediate house is the most suitable place for it whilst growth is being made, and the cool house when at rest, but it should be exposed to as much sunlight as is practicable at all times.

Dendrobiums.—Attention is now required by the deciduous and half-deciduous species, as the time is now approaching when many of them will finish their growth. It is often from lack of knowledge of the requirements of the plants at this time that failure to bloom the plants satisfactorily is due; and where many *Dendrobiums* are cultivated, it never happens that all of them at the same date have finished their growth for the season. Hence the need of selecting those that have done so from the rest. This will be known by the end-leaf at the top of the pseudo-bulb or stem having expanded; and these should be placed in a side of the house where plenty of light and air can be admitted, less moisture being afforded them. The blinds should be drawn down merely as a protection during the sunshine in the middle hours of the day, being drawn up by 2 P.M. In very changeable weather there is no necessity to shade the plants at every burst of sunshine, as they will stand a considerable amount of sunlight at this period without suffering. The plants should not be allowed to become very dry at this stage, or a check will be given that may cause a renewal of growth, instead of but one annually; therefore, in order to keep the plants in vigour, the drying-off must be very gradual. *Dendrobium Wardianum*, a species that is very liable to make a second growth immediately the new bulbs are made, must be rested all the same till the flowers fade. After having undergone seven to ten days' treatment in the warm house, the plants will have become inured to direct sunlight, and the new bulbs become fully developed, and they may then be removed to a cooler and drier house, or an ordinary greenhouse, or ainery from which the Grapes are cut; placing them where they will have plenty of sunshine, and taking care that cold draughts do not reach them. Here much judgment will be required in affording water, as from being exposed to the sun's rays and a drier air, the surface of the compost becomes dry quickly, but below it is still moist, and if the roots of the plants are kept

in a saturated compost, premature decay will set in. It is prudent, therefore, to err on the side of dryness rather than the reverse. I examine the plants two or three times a week, and as soon as signs of shrivelling are observed in a plant, a copious watering is afforded. In the autumn a plant, as a rule, will need water about once a week. The following varieties are now finishing their growth for the year:—*D. Wardianum*, *D. crassinode*, *D. nobile*, *D. aureum*, *D. heterocarpum*, *D. Linawianum*, *D. Findleyanum*, *D. transparens*, *D. Pierardi*, *D. lituiflorum*, and *D. tortile*; also the hybrids *D. Juno* ×, *D. aspasia* ×, *D. cybele* ×, *D. Dominianum* ×, *D. xanthocentrum* ×, *D. splendidissimum grandiflorum* ×, *D. euosmum leucopterum* ×, *D. endocharis* ×, *D. micans* ×, *D. aureo-Wardianum* ×, *D. Wardiano-japonicum*, *D. melanodiscus* ×, *D. chrysodiscus* ×, *D. Ainsworthi*, and its congeneric crosses. There are many plants, deciduous and evergreen species, which are still growing, viz. *D. Dalhousieanum*, *D. clavatum*, *D. Huttoni*, *D. Venus* ×, *D. mochatum*, *D. fimbriatum*, *D. Paxtoni*, *D. suavisimum*, *D. chrysotoxum*, *D. thysiflorum*, *D. primulinum*, *D. cretaceum*, *D. crepidatum*, *D. sanguineum*, *D. Boxalli*, *D. Parishii*, *D. crystallinum*, *D. anosmum*, *D. Bensoniae*, *D. superbum* (macrophyllum), and its lovely varieties, *Huttoni* and *Burkei*. Plants of these species should be afforded liberal treatment in the hottest house till growth is finished. Plants of the splendid *D. Phalaenopsis* now in full growth will require plenty of light and sun heat, and an abundance of water, and, like *D. Bensoniae*, its roots should never be thickly covered over with compost. The species *D. bigibbum*, *D. superbiens*, *D. Goldiei*, *D. stratiotes*, *D. lineale*, *D. streblolaceras*, *D. taurinum*, and *D. secundum* also luxuriate under this kind of treatment. The rare *D. atrovioleaceum*, *D. spectabile*, *D. D'Alberti*, *D. Treacherianum*, and *D. macrophyllum Veitchianum* appear to thrive best when grown in stove temperature, but in rather more shade than the varieties mentioned. *D. Falconeri giganteum* should be placed within a short distance of the roof of the Cattleya-house, in an airy position; and whilst growing, the plant should be afforded water frequently. *D. longicornu*, *D. subclausum*, and *D. Kingianum* do not require so much heat as the evergreen or deciduous species, but copious applications of water at the root whilst growing, and a light position in the *Odontoglossum*-house all the year round.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Pot Vines.—When the wood is well ripened, and the foliage hardened by exposure to the sun and free ventilation, these plants may be placed against a wall, hedge, or fence out-of-doors, the canes being secured in an erect or oblique position. Here they may remain for from two to three months. In order to remove these Vines so as not to twist them or injure the leaves, two men are required, one carrying the pot and one the cane. Water must be freely applied whenever the soil approaches dryness. The maturation of the wood of less forward Pot Vines should be secured by affording artificial heat and free ventilation; stopping laterals at the second point from the base as often as may be required; and keeping red-spider in check by the use of the syringe and clean rain water in the afternoon of fine days.

Strawberry-plants for Forcing.—So soon as a sufficient number of layers are rooted in the small pots the work of repotting them into 7 and 8-inch pots may be finished without delay.

Figs.—Trees on which a second crop of fruits is swelling, will need water at the root, and occasionally manure water, the trees being syringed thoroughly once on fine days, preferably in the morning. Let the apparatus be kept warm—65° to 70° at night; during the day a warmth of 10° to 12° higher, according to the amount of sunshine, may rule, and afford a slight amount of top-ventilation during the night, whilst the air afforded during the day must necessarily follow outside conditions. Trees that have borne a second crop must be afforded plenty of air, cutting out shoots that have reached their fullest extension, and all weak, unfruitful shoots. Water at the roots should only be applied when the border, &c., is getting very dry, and employ the syringe on fine days. If white or brown scale are observed on the shoots or leaves, remove them with a bit of sponge and soap-suds made from soft-soap. Pot plants may have their heads immersed in water, at a temperature of 145°. Bushes for early forcing growing in pots should now have the wood in a well-ripened state, and if that is the case, they may be placed outside in a warm place,

on a bed of coal-ashes, seeing that they do not lack water at the roots; failure to afford water causing the untimely fall of the leaves.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Taking Cuttings of Pelargoniums, &c.—The time has arrived when cuttings of many of the bedding plants should be struck, the rather slow-rooting, variegated-leaved Pelargoniums being the first to claim attention. Owing to the drought experienced in some parts, Pelargoniums have made but little growth, and cuttings will be somewhat difficult to obtain. After making the cuttings, dibble them into boxes filled with a mixture of fine leaf-mould two-thirds, and sharp silver-sand one-third. If cold frames are available, the boxes may be placed therein, standing them on inverted pots or rough slates so that the cuttings may get plenty of air; and let them have the fullest sunshine. The lights should be used only in very rainy weather. The cuttings will not need any water for some time after insertion, or before they have put forth roots; when, if the soil has become very dry, the soil may be afforded water enough to moisten it; much water causes damping-off, which may occasion great losses. In this connection it is well to afford good drainage to the cutting-boxes, and the best kind of box is that made with a spar-bottom. If cold-frames are not available, the boxes may be placed in a sunny spot out-of-doors, each box being placed on a few bricks.

Antirrhinum Queen of the North.—This variety, in my opinion, is superior to any other in colour, and the variety comes quite true from seed, which few varieties do. I know of no other plants suitable for the flower-garden which is equal to it for massing. The flowers are pure white. The plants grow of about one height, another point in its favour. The plant continues in flower until late into the autumn, is raised by sowing in the spring months, and requires no protection in the winter.

Hyacinthus candicans just coming into flower should have a neat stake put to each plant, and the flower-spike secured to it.

Aloysia citriodora.—A few of this fragrant plant should be found in every person's garden, the leafy shoots forming pleasant material for mixing with cut flowers. The plants make rapid growth when planted in a favourable situation, and may be lifted in the autumn and kept green, if so desired, through the winter.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Mignonette.—Seeds may now be sown in 48-sized pots, filled with good fibrous loam five-sixths, finely-sifted horse-manure one-sixth, and sufficient sharp sand and pounded mortar to keep the soil open. The young plant is particularly liable to injury from a soddened soil, turning yellow and dying off. Let the pots be new, or old ones made quite clean by washing, and the drainage good, with a little rough soil over it. When the pots are filled with soil, which should be pressed firmly, stand them aside, and afford water with a rose watering-can, and in twenty-four hours the seed may be sown thinly, sprinkling a little fine soil over it. Place the pots in a cold frame, and shade with brown-paper till the seedlings appear. Another sowing may be made towards the end of the month, or in September.

Gardenias.—It is a suitable time in which to put in cuttings of any of the varieties, choosing soft growing shoots, and either placing them singly in thumbs, or round the sides of a 5-inch pot. The mixture used for filling the pots should be light and sandy, and care must be taken not to bruise the cutting with the dibbler, or it will decay. Place the pots in a close, moist propagating-frame, and shade from bright sunshine. When several cuttings are inserted in one pot, they should be potted-off as soon as they are well-rooted, and before the roots get entangled. When established pinch out the point. Plants growing freely may be assisted by weak manure-water afforded at frequent intervals. That made from deer's or sheep's-dung is very useful, and it is safe if used in a weak state. Alternately with this clear root-water may be used. Let the plants be afforded a strong heat, with plenty of aerial moisture, using the syringe freely amongst them. If mealy-bug appears, at once use either petroleum emulsion or Richard XL All liquid.

Bulbs for Forcing.—The time is at hand when *Lilium longiflorum* var. *Harrisi*, *Freessias*, Roman *Hyacinths*, Spanish *Iris*, &c., will be arriving from the continent, and timely preparations should be made for potting them, some loam being placed under cover in order that it may be in a suitable condition to handle when required. Pots can be washed and crocked; a site prepared for the pots to stand upon, and coal-ashes or other material placed handy wherewith to cover the pots.

Fuchsias.—If cuttings are now inserted and the young plants carefully grown-on during the winter, they will make useful plants for early work next year. Old plants which have flowered should be stood outdoors to thoroughly ripen the wood; for if plants are stored away for the winter and the wood is not firm and well ripened, the shoots shrivel and die away. Flowering examples for late work may be kept behind a south wall, and their wants carefully attended to, not letting them lack water at the root.

Miscellaneous.—If there is a flower-house, it must be made as attractive as possible with *Lilies*, *Celosias* in variety, *plumose* and other; *Balsams*, *Fuchsias*, *Abutilons*, *Browallias*, so as to vie with the out-of-doors display, everything being neatly arranged and kept free from insects, spent blooms, &c.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Figs.—The fruits on wall-trees will soon begin to ripen, and call for protection from birds, flies, and wasps, and the best kind of protection is a muslin bag, made a little larger than the fruits, which should be fastened over a fruit when the colour of ripeness is noted. Doing this occasions a good deal of trouble if fruits are numerous, and I can only recommend their use for the largest fruiting varieties, such as *Brunswick* and *Brown Turkey*, the first-named in the south often reaching 8 oz. in weight. The fruit of the Fig differs from most fruits in the ripening ceasing with its removal from the tree, and in order to obtain high flavour it must ripen perfectly on the tree, the signs of which are the exudation of juice from the eye, resembling a drop of honey, the skin getting thinner and the flesh tender. It is possible to keep a ripe fruit for a day or two after gathering in a dry warm room. Rats and mice sometimes commit havoc with the fruit. The Fig in rich soils is apt to grow exuberantly and to be crowded with shoots which, if not removed, entirely prevent the due ripening of next year's bearing shoots. It is good practice to thin out these shoots before the crop begins to ripen, retaining a sufficient number of the stronger shoots to furnish the tree, training and fastening these temporarily in their places, and at full length, not stopping them, the fruit always forming near the end of the shoot. In the warmest districts only may an exception be made to this practice, where, by leaving a few extra strong shoots in prominent positions, and stopping them at this season, some of the second crop of fruits may ripen if the autumn is very warm. Afford water to the border occasionally if the weather is hot and parching, the more if the trees are planted in dry positions, or if much mortar-rubble was incorporated with the soil. In *Sussex*, *Kent*, and the southern maritime counties generally, the Fig needs scarcely any cultivation, large crops of fruit being obtained when the trees are planted in warm situations against walls or free standing, and usually the production of fruit is so abundant that wood-growth is kept greatly in check, and is rarely superabundant, and the older the tree the more fruitful. At *Tarring*, in *Sussex*, the Fig is grown in the open in the summer, and lifted and placed in sheds and cellars for the winter, and its cultivation there is commercially a success. Such plants have compact balls of roots and soil, and get used to removal annually.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Jerusalem Artichokes.—At this season there is not much needed to be done beyond keeping the ground free from weeds, and topping the stems when these have grown to their full height, i.e., cutting away 2 feet of the top, and trimming off the side shoots. This sort of pruning has the effect of assisting in the development of the tubers.

Celery.—As the heart leaves rise higher in the plants, let earthing-up be gradually carried on, being careful not to cover the tops of the heart leaves in the process. Let the later rows of Celery be kept free from weeds,

and the plants from suckers, and the soil frequently stirred with the short-handled draw-hoe. If the quantity of manure put into the trenches was not large, manure-water may be afforded the plants, but avoid over-feeding them, as this spoils the flavour, and renders the plants liable to rot at an early part of the winter.

Seed-sowing.—If from any cause *Onion*, spring *Cabbage*, *Spinach*, *Lettuce*, *Turnip*, and *Carrot* seeds have not been sown, no time should now be lost in getting them into the ground, the soil being in excellent condition since the late rains.

Lifting the Onion Crop.—When a half-withered appearance in the tops indicates the maturity of the bulbs, it is time to pull them; and when pulled they should be spread out thinly on mats, hurdles, or, failing these, on hard ground or gravel walks, covering them at night with canvass or mats if rain be likely to fall. The bulbs should be kept turned daily till thoroughly dried, when they should be placed thinly under cover to be sorted and stored on a rainy day.

Work in General.—Hedges may now be clipped and pruned, also Box edgings. Remove decayed vegetation from the quarters, burning *Potato* tops and *Pea* haulm, perhaps infested with fungus, and generally preserve a tidy appearance in the kitchen garden. Sweet herbs may still be cut for drying, and ripe seeds of vegetables gathered and spread out to dry.

THE APIARY.

By EXPERT.

Extracting.—Tiering boxes full of combs need not be removed from the hives till wanted for extracting purposes, honey keeping better in the hives than in the house; at the same time extracting should not be deferred longer than can be helped after honey is sealed. Great care is required in hot weather in handling newly-built combs heavy with honey, especially if they are not built down to the bottom bars of the frames. The bees should, in these cases, be brushed off the combs with a feather—not shaken off as is usual. Always return frames to the hives after extracting in the evening, and let them be placed in the same hives, and in the same position they filled before the honey was removed. A little judicious care in handling honey indoors will keep bees from trying to enter the house, and save annoyance from them. When excluder-zinc has not been used, queens are not occasionally found in the supers, and this risk must not be overlooked when clearing them of bees. Frames from which the honey has been extracted should be given back to the bees to clean up before being packed away for the winter. Always do this in the evening, as it excites the bees a good deal, and they then have time to settle down before the morning.

Condemned Bees.—Where a good supply of frames of comb is on hand, these may be worked up into fine stocks if two or more are united and fed up well before the end of September. Bees will unite readily just after driving, and it is only necessary to secure the best queen to head the stock. They should if possible be united and put into the hive the same evening on which they are driven. Very strong lots will soon build out comb foundation if given it in full sheets, but of course ready-built combs are preferable.

Removing Surplus Honey.—Without special reference here to the varied quality of the honey stored in so special and peculiar a season as this, we may say that except in heather districts the season is now virtually over, and all surplus honey may, therefore, be removed. In a very dry season like the present, no more will have been gathered over and above what was required for daily consumption since the middle of July. Unsealed sections should be removed and extracted at once, as no sealing will now be done, and the honey will be taken down into the body of the hive if left for a longer time. In some seasons bees are irascible and mischievous when they are being deprived of their stores, and unless an apiary is kept quiet and free from the wild disorder we sometimes meet with, where no care is used, a great deal of annoyance may be caused, not only to the bee-keeper himself, but to his neighbours as well.

WHEAT PROSPECTS IN AMERICA.—Reports from the Wheat-producing States are to the effect that the average condition of spring and winter Wheat combined is 89.4, or 4.5 points higher than at the corresponding date (July) last year; and 6 points higher than at the same date in 1896.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Aug. 17	Shropshire Horticultural Society's Show, at Shrewsbury (2 days). Dover Horticultural Show (2 days). Shanklin (Isle of Wight) Horticultural Show.
THURSDAY, Aug. 18	Royal Jersey Horticultural Society's Show. Niton (Isle of Wight) Horticultural Show. Pontefract Castle Horticultural Show.
FRIDAY, Aug. 19	Devon and Exeter Horticultural Society's Show. National Co-operative Flower Show, at the Crystal Palace (2 days).

SALE.

FRIDAY, Aug. 19	Imported and Established Orchids, at Protheroe & Morris' Rooms.
-----------------	---

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—62° 1°.

ACTUAL TEMPERATURES:—

LONDON.—August 10 (6 P.M.): Max., 68°; Min., 54°.

PROVINCES.—August 10 (6 P.M.): Max., 71°, East Scotland; Min., 60°, West Scotland.

FEW men have proved greater benefactors to decorative gardening than M. LATOUR-MARLIAC. The hybrid Water-Lilies, which formed the subject of his lecture on Tuesday last, are among the most lovely and most easily cultivated of plants, and it is to his skill that we owe them. The Veitch Memorial Trustees this year recognised his merits by awarding him one of their medals, which was formally awarded at the Ghent show in April. Hybrid Water-Lilies we had before M. LATOUR-MARLIAC began his operations, but they were mostly, if not entirely, hybrids between tropical or semi-tropical species, such as the hybrids *Devoniana*, *Daubenyana*, and others, raised in the Botanic Garden, Oxford whilst the great advantage of the present series is that they are mostly hardy, though some show to greater advantage if the waste steam can be conveyed into the pond or lake in which they are growing, so as to heat the water slightly. What M. LATOUR-MARLIAC may have in store in the future we cannot tell. At present the cultivated Water-Lilies are blue, as the old *Nymphaea cœrulea* or the Australian *N. gigantea*, and some others. These blue-flowered species form a group by themselves and generally refuse to cross with others. Then there are white Water-Lilies, whose loveliness is appreciated by everyone; these may assume by hybridisation or natural variation rose-coloured tints, as in the rosy form of the common white Water-Lily.

Then there is a yellow-flowered section, including *amazonum* and some others.

The Lotus group, characterised by their bold habit, thick petals, and blunt anthers, not provided with any terminal process, has in the type white flowers, but among its nearest relatives or descendants are flowers of all shades of rose up to deepest crimson.

M. MARLIAC has at present thirty-four dis-

inct varieties, and doubtless many more are to come. M. FROEBEL, of Zurich, has one very richly-coloured variety. The climate of Great Britain is considered very suitable for them, the cloudy sky not inducing the scorching of the bloom which takes place in a dryer, clearer atmosphere. Heavy loam without manure, the temperature of the water as nearly equal to that of the air, still water—these are the main points to be attended to. For those who have not a quiet pool at their disposal, a tub half filled with mould, covered with 6 to 8 inches of water, is all that is required. We believe the late Reverend Mr. ELLACOMBE, the father of Canon ELLACOMBE, grew many in this way, but that was before the days of LATOUR-MARLIAC. Once we grew them in a deep drain-pipe closed at the bottom and sunk in a Rhododendron bed. The plan answered well till one day the frost split the pipe, and all was over. This, again, was before the days of MARLIAC.

We do not know precisely of what species M. LATOUR-MARLIAC has availed himself; it is, however, obvious that there is an abundance of colour to select from, whilst by breeding from the North American and Canadian *odorata* and *tuberosa*, great power of resistance may be obtained. In his paper read on Tuesday, M. MARLIAC mentioned that he impregnated the richly-coloured tropical forms with the pollen of the hardy varieties such as *tuberosa* and *odorata* above-mentioned.

Water-Lilies, like most other plants, are very sensitive to slight changes in the "environment," and hence they vary so considerably that it is not always easy to discriminate between the species. M. LATOUR-MARLIAC has increased this difficulty, for which some botanists will not thank him, whilst others, taking a broader view, will recast their opinions as to what is a species, and probably greatly extend it. At any rate, the only narrow limitations are broken down on all sides.

Amongst other means of discrimination, some degree of help may be obtained from the examination of the arrangement of the air canals, with which the leaf-stalk and the flower-stalk are traversed from one end to the other. Many years ago it was found practicable in the Oxford Botanic Garden, in the absence of flowers, to ascertain, by their aid the group to which a particular specimen belonged, and to make a good guess as to the species. Of course, variation must be expected, but this affects principally the smaller tubes.

Fac-similes of the arrangement of the air-canals in the petioles and peduncles of these plants were obtained by cutting horizontally across the leaf or flower-stalk, and applying the cut surface to a pad of blotting-paper, saturated with ink, and then taking an impression from the blackened section upon white paper, as suggested by the late WILLIAM BAXTER, of the Oxford Botanic Garden. Thin transverse sections of the petioles and peduncles may also be pressed and dried for future reference.

From the results thus obtained, it will be seen that the variations in the arrangement of the air-canals in the species of *Nymphaea* may be reduced to four principal modifications, of which two have reference to the disposition of the air-canals in the leaf-stalk, and two to that which obtains in the flower-stalk.

Of the two modifications which exist in the petiole, the first is that in which there are four central canals, disposed in pairs opposite to each other, and surrounded by a varying number of smaller tubes. The most perfect illustration of this modification is to be found in the petioles of *Nymphaea odorata* and *N. minor*. In *Nymphaea alba* and *N. nitida* the same arrangement prevails, but the four central canals

are here surrounded by a number of smaller tubes, as is also the case in the leaf-stalks of *Nymphaea cœrulea*, *cyanea*, *micrantha*, *pygmæa*, *mexicana*, in which species, moreover, two of the central canals are usually of greater diameter than the other two. The petioles of *Nymphaea elegans* and *N. ampla* possess the same arrangement of their air-tubes. The species in which this modification exists belong to the sections *Cyanea* and *Castalia*.

The second modification in the arrangement of the petiolar air-tubes is that in which there are two central canals of a semi-elliptical form, and of much larger diameter than those by which they are surrounded, as in the petioles of *Nymphaea amazonum*, *Lotus*, *rubra*, *dentata*, and *Devoniana*, the latter being a hybrid between *Nymphaea rubra*, and *N. dentata*.

The arrangement of the peduncular air-tubes likewise presents two principal modifications, of which the first is that in which there are four central canals, arranged in pairs, exactly in the same manner as has been described in speaking of the first modification of the arrangement of the canals in the petioles. The species in which this modification occurs are *Nymphaea odorata*, *minor*, *pygmæa*, *nitida*, and *alba*, which have therefore a similar disposition of the air-tubes in their leaf and flower-stalks. The species enumerated are all included in the section *Castalia*.

The other mode of arrangement of the air-tubes in the flower-stalk is that in which there are five, six, or more, central canals, of large diameter, disposed round the centre of the stalk, and surrounded by one, two, or more rows of smaller canals, each row containing twice as many canals as the row immediately internal to it, as in the flower-stalks of the following:—*Nymphaea cyanea*, *mexicana*, *cœrulea*, *micrantha*, *Lotus*, *dentata*, *dentata major*, *rubra*, and *Devoniana*, a list comprising species belonging to all three of the sections into which De Candolle has divided the genus. *Nymphaea elegans*, *amplea*, *amazonum* and *gigantica*, probably also belong to this group.

By taking the characters of the petioles and peduncles together, the before-named species of *Nymphaea* may be divided into three groups—First, where the arrangement of the air-canals is similar both in leaf-stalk and flower-stalk, consisting of four central canals, arranged in pairs, and surrounded or not by other smaller tubes. Under this head are included *Nymphaea odorata*, *minor*, *alba*, *nitida*, and *pygmæa*, all of which belong to the section *Castalia*.

The second group is that in which the air-tubes of the leaf-stalk are disposed in the same manner as in the first group, but in the peduncle there are five, six, or more canals, placed around the centre of the flower-stalk, and encircled by one, two, or more rows of tubes of smaller diameter, but each row containing twice as many air-tubes as that immediately interior to it; thus, supposing that there are six large tubes in the centre, the row exterior to it will contain twelve of smaller diameter; this again will be surrounded by a row of twenty-four canals, of still smaller size, and so on. Of the species heretofore enumerated the following belong to this group: *Nymphaea cœrulea*, *cyanea*, *mexicana*, *micrantha*, the two former belonging to the section *Cyanea*, the latter to the section *Castalia* of De Candolle.

The third group includes those species in which the petiole has two large semi-ovate canals, and in which the arrangement of the canals in the peduncle is the same as has just been described in the second group. The species in which this disposition occurs all belong to the section *Lotus* of De Candolle; they are: *Nymphaea rubra*, *Lotus*, *dentata*, *dentata major*, and *Devoniana*.

With reference to the radiating tuberculated hairs which exist in the air canals of some of these plants, and which are readily visible by the naked eye, M. Trécul was of opinion that the form of these hairs varies with the species but, this is not borne out by observation; the canals of largest diameter, such as those which occur in the petioles of *Nymphaea dentata*, and others of the section *Lotus*, have few, if any, of these singular and beautiful structures. In no species

VANDA ×, MISS JOAQUIM. FROM THE COLLECTION OF SIR TREVOR LAWRENCE, BART.

heartly co-operation of their guest, Mr. HENDERSON. From close contact with him in deliberations of their society it had been an uninterrupted pleasure to work with him. He concluded by wishing him long life, and just hoped they would have another quarter of a century's services from him. Mr. HENDERSON having replied in suitable terms and thanked the donors for their handsome gift, the meeting soon broke up. Among those present was perhaps the oldest competitor of the society, Mr. JOHN POTTIE, Balgonie Place, who has been forty-eight years a member of the society, has competed every year, and never failed to be in the annual prize-list.

PRESENTATION.—Mr. FREDK. GEESON, on his retirement from the position of gardener to the late Earl of EGDMONT, of Cowdray Park, Midhurst, consequent on the changes in the establishment, has been presented with a silver-mounted walking-stick, with a suitable inscription, cigarette-case and holder, together with an address from the men employed in the gardens, expressing their regret on his retirement, and wishing to recognise his straightforward dealing and general kindness in his long connection with them, and express a wish that he may soon obtain a good appointment where his skill as a gardener will be suitably appreciated.

CATERHAM GARDENERS' OUTING.—On Wednesday afternoon, Aug. 3, four brake loads of the Caterham gardeners and their friends, numbering 47, were—thanks to the generosity of Mr. JEREMIAH LYON—taken to Box Hill, Dorking, and to Burford Lodge, where Sir TREVOR LAWRENCE took them over his beautiful garden and Orchid-houses, and afterwards entertained them to tea on the lawn.

VEGETABLES.

PEA "MANSFIELD SHOW."

WE have received a Pea plant and gathered pods of the above variety from Messrs. Wright Bros., Mansfield, Notts. The plant possessed seventeen pods, with an average of eight seeds in a pod, or a 136-fold yield. Peas dark green and flattened, pods straight, flavour sugary, and cooking of a good colour. The variety is, we are told by the raiser, the result in the first instance of a cross between Carters' Stratagem and Sharpe's Triumph, made nine years ago, and of rigid selection afterwards. They further inform us that 3½ feet is the average height of the rows. It is exceedingly vigorous and hardy. The variety was given an Award of Merit at the trials at the Royal Horticultural Society's Gardens, Chiswick. As many as twelve good Peas have been found in a pod.

PLANT NOTES.

DIANTHUS ATKINSONI.

AMONG species of Dianthus, "Pinks," I know of none to equal D. Atkinsoni for freedom of flowering and brilliancy of colour. Although a garden hybrid, with, presumably, D. chinensis as one of its parents, it is not so often seen in gardens as it should be. When planted on a rockery in a sunny situation, and in a soil consisting of sandy loam, its large, deep crimson flowers make a striking display at this

season. These are borne in great profusion on stems 10 to 12 inches in height, while the leaves are linear-lanceolate in shape, and dark green in colour. As it does not ripen seed, the only method of propagation is by means of cuttings, which root readily if taken off about 4 inches long, and placed in pots in a compost of sharp sand and loam, provided they are carefully watered and shaded from excessive sunshine. It is thoroughly hardy, and although reputed by some authorities to be of biennial duration, with me it is a true perennial, increasing rapidly year by year. *E. S., Woking.*

A PÆONY DISEASE.

"PREVENTION is better than cure," holds good in the instance of plant diseases, as in other matters, and as I am already under a ban for being too personal in indicating what I consider as shortcomings on the part of practical gardeners, can, without suffering

FIG. 32.—A PÆONY DISEASE.

1. The Botrytis or summer condition of the fungus, which forms a white meal on the surface of diseased stems just above ground-level; $\times 400$.
2. Sclerotia, formed in decayed stems; $\times 400$.
3. A Sclerotium germinating and producing chains of spores; $\times 400$.
4. The minute spores formed by Sclerotia reproducing themselves by budding; $\times 400$.

further condemnation, pursue the same course. My present grievance is that gardeners—as a rule—do not anticipate danger, so far as fungous diseases are concerned. "How much should a gardener know," is a matter that is now being discussed in various periodicals, and even Mr. Percy T. Ingram, who enumerates some forty different requirements as essential to constitute an up-to-date gardener, seems oblivious of the fact that the subject of plant diseases should be one of the factors necessary for attaining to that desirable position.

Pæonies are not classed among the category of plants difficult to cultivate, and even when severely left to themselves in old-fashioned cottage gardens, usually make a good show; whereas, when specially nursed, the gardener observes that his grassy manure-fed plants, just before the period of blooming, too frequently become limp, and within a week have completely collapsed, leaving unsightly gaps, which it is impossible to fill before next season. A fungus is the cause of this misfortune, and it effects its

object as follows. If the lower portion of a diseased stem is placed in a bottle containing a small quantity of water, and allowed to remain for two or three days, its surface will present a white, mealy appearance, caused by the fungus, which has produced its fruit on the surface of the stem. Of course, the same happens if the stem remains standing, only the white spots are blown away by wind or washed off by rain as soon as mature, consequently the fungus is not so conspicuous as when protected from wind and rain in the bottle. If a minute portion of this apparent white meal is examined under a microscope, it will be found to consist of numerous upright branches, each bearing a dense cluster of spores or reproductive bodies at its tip (fig. 32, 1). These spores, when ripe, are carried away by wind or rain, and those that alight on Pæony stems germinate on the surface, the germ-tube penetrates the stem, and forms a mycelium in its interior, from which a crop of spores is eventually formed on the surface; the time required for this development varying from six to ten days, depending on the amount of moisture and temperature present. This condition of things continues throughout the summer—that is, if diseased plants are not promptly removed and burned. When diseased stems are nearly dead, the fungus ceases to produce the kind of fruit described above, but the mycelium present in the cortex, or outermost portion of the stem, becomes resolved into myriads of very minute brown nodules or sclerotia (fig. 32, 2). As the diseased stems decay, these sclerotia are deposited on the soil, where they remain in an unchanged condition until the following spring, when they give origin to several slender branches, each of which bears at its tip three or four chains of very minute conidia (fig. 32, 3). At maturity the conidia forming these chains separate from each other, and further, each conidium is capable of germinating and forming a mycelium, and if this germination occurs in contact with the young and tender stem of a Pæony just above the ground-line, infection takes place, and the summer form of the fungus quickly follows.

As already stated, the summer spores are transported by wind, and alight in all sorts of situations. Carefully-conducted experiments have shown that these spores possess the power of germinating, and forming a mycelium on dead and decaying vegetable matter, as well as on living Pæony stems. When growing on a living host, several crops of white summer-spores are formed; whereas, when growing on dead material, there is a tendency to form sclerotia from the first. Now, manure-heaps, on account of the extra temperature and moisture, greatly favour the germination and growth of any spores that alight thereon, and the formation of myriads of sclerotia follows. When these sclerotia form their chains of spores, the latter continue to add to their number by a process of budding or sprouting similar to that which occurs in the reproduction of the yeast fungus (fig. 32, 4). Gardeners insist in saying that the application of green manures causes the disease of Pæonies and certain other plants, and the contention is perfectly true; a young Pæony stem growing through a layer of manure, probably teeming with sclerotia and budding spores, cannot be expected to escape in every instance, and if only one is inoculated, the disease spreads rapidly.

Regarding the value of green manure, or manure that is still fermenting, as a fertilizer, we have nothing to say at present; but from our standpoint, we have no hesitation in stating that every such manure-heap is a hot-bed of fungous disease, and is such for several distinct reasons: 1. Diseased refuse of every kind, as a rule, finds its way there; the common idea being, that if a crop fails, possibly owing to the attack of some fungus, it will at least make manure, and thus is not wholly lost. Let him who acts on this idea remember sclerotia and budding spores. 2. The higher temperature of a "sweating" manure-heap causes a continuous influx of cold, spore-laden air on every side. 3. The temperature, moisture and abundant nutriment present favour the rapid germination and development of fungus spores.

PREVENTIVE MEASURES.

Remove and burn all drooping stems the moment the first symptoms are observed.

Where the disease has previously existed—or better, under any circumstances—remove the surface-soil early in spring, and replace with fresh soil mixed with quick-lime.

Do not use green manure as a top-dressing.

The mycelium of the fungus is not perennial in the root of the Pæony, so that it starts life perfectly free from its enemy each year, and can only become diseased through inoculation from sclerotia lying in the soil, from germs contained in manure, or from floating summer-spores borne from some diseased plant growing in the neighbourhood. *Geo. Massee.*

CARNATION QUEEN OF THE YELLOWS.

The flower of which fig. 33 is a representation was kindly sent for our inspection about July 20 last, with a note from the senders, Messrs. B. S. Williams

decorative beauty of this one, and at this season of the year there are few flowering shrubs which are capable of creating such fine effects when treated as a solitary specimen. A native of North America, it is quite hardy, and succeeds in almost any kind of soil. *E. S., Woking.* [S. Lindleyana is even larger. *Ed.*]

HOME CORRESPONDENCE.

A LARGE LILIAM AURATUM.—I recently visited an amateur gentleman, Mr. John Kinloch, Kilmalcolm, near Paisley, who has a *Lilium auratum* of which he is naturally proud. Several years ago he bought the bulb for a shilling, and has succeeded in producing a plant of gigantic proportions. The bulb now fills a 14-inch pot, has quite a forest of stems, and 261 blooms. It is not of the monstrosium type, with flat stems and small flowers, but the true *auratum*, with round stems and large flowers. The plant is in perfect health and well foliated to the bottom, each bloom is perfect, the whole forming a magnificent mass of flowers. *Robert Macfee.*

FIG. 33.—CARNATION QUEEN OF THE YELLOWS.

& Son, of the Paradise and Victoria Nurseries, Holloway, to the effect that the variety was the best yellow variety with which they were acquainted—an opinion with which we were also entirely in agreement. As gardeners are aware, a faultless yellow Carnation is a decided acquisition to florists and floral decorators, and if it have fragrance, its value is enhanced.

TREES AND SHRUBS.

SPIRÆA ARIÆFOLIA.

I NOTICED recently in this neighbourhood a remarkably fine specimen of this species, that was quite 7 feet in height, several yards in diameter, and completely covered with its panicles of nodding creamy-white flowers. Although the species of shrubby *Spiræas* are numerous, I was greatly struck by the

LA VERSAILLAISE RED CURRANT.—Though arousing little notice, there was exhibited at the last Drill Hall Meeting of the Royal Horticultural Society a dish of this fine Currant from Jersey, under the name of Comet. I regret having been unable to wait till the dish came before the Committee, that I might back Mr. A. H. Pearson in his contention that the variety was La Versaillaise and no other. The sample sent was not one whit finer or better than are examples of the French Currant, our Red Cherry, one sees in so many directions. The Fruit Committee some time since unhappily were induced to grant this Jersey Currant an Award of Merit, under the name of Comet. I objected at the time to that course, and now feel that there is no other course open but to revoke that award, and thus save the public from purchasing an old variety under a new name. *A. D.*

BLINDNESS AMONG STRAWBERRIES.—I have been much interested in your correspondent's remarks on this very old subject, and think Mr. H. Fisher, of Flixton, and Mr. W. Horne, of Cliffe, have

both indicated one cause, at least, of this misfortune, viz., excess of vigour. Mere growth and fertility are at opposites among the Strawberry-plants, as well as among the Apples, Pears, and Plums. Push vigour beyond measure and you must pay for your temerity, and undue disturbance of natural laws by sterility more or less pronounced. The Editorial suggestion of increasing the supply of pollen—which used to be successful enough in the forties in making blind or barren Hautbois fruitful—might or might not have more or less effect on our over luxuriant Strawberry-plants of to-day. A row or two of the old Black Prince or Garibaldi would be worth trying alongside of Monarch or other semi-sterile varieties. To give, however, the Editor's suggestions a fair chance of success, his conditions must be carried out in regard to time most exactly. "Plant some fertile variety coming into flower at the same season in alternate rows to Monarch." The subject is of more importance than it seems. Blindness is by no means confined to Monarch. Anyone familiar with the raising of new Strawberries or growing old ones over large areas, are mostly all too familiar with the weakness or malady of blindness. So great in various forms is it among seedlings, that it might prove a useful rule to insist that no new Strawberry should have a Certificate of Merit from the Royal Horticultural or other responsible Society until it has been seen three or more times. Alike in form, size, colour, flavour, fertility, such a rule would enable novelties to settle down into fertile ways before being medalled or certificated. Even such a generally well-informed writer as "A. D." needs to be reminded that, though he may never yet have heard of a case where Strawberry flowers went blind because pollen was absent [Common enough. *Ed.*] he must surely have heard of or seen many in which they went blind through bad or injured pollen, or stigmas untimely mated, or pollen imperfectly matured. The term blindness may, therefore, be said to range over the entire field of Strawberry cultivation, from total blindness, that is, the entire absence of flowers, through blindness of various degrees, from frost, an excess of heat, moisture, drought, over-feeding, over-rich soil, or through excessive manure, sudden transitions from heat to cold, drought to moisture, shade to sunshine, liberal rations to stinted measure, are the main causes of abortion among Strawberries. Some sorts of blindness are called blacks, and others barrenness. The first is the work of the frost, and is often confined to the embryo fruits, the stamens being harder often escaping to no good purpose. Barrenness may consist of different percentages of flowerlessness, as seen in the ratios given by Messrs. Bunyard and Fisher. Notwithstanding all that has been said, and apparently proved by botanists, on the dioecious character of some Strawberries, not a few growers still stoutly deny this; and the most stubborn difficulty of all is that blind or sterile beds of Hautbois and others left for destruction, or treatment with more and better pollen, have taken again to fruiting freely without the remedial measures. Possibly in their year of blindness and sterility these Strawberries sowed their wild Oats—that is, their excess of vigour in their years of barrenness—which enabled them to bear good crops for some years afterwards. The moral seems to be, do not over-feed young Strawberries, especially choice ones. But then old Keens' Seedling was seldom without a few old blind rogues, which were always stronger and more fertile in runners than the normal stock. *D. T. F.*

CARBOLIC SOAP AND GREEN-FLY.—Your correspondent, "W. W.," is perfectly justified in calling the attention of your readers to the effectiveness of carbolic soap in the destruction of the common Rose aphid, but he cannot claim to have first made the discovery, for I have used it with success for many years, and during the past six years have had ample opportunities of expatiating upon its merits as an insecticide of great value to gardeners. Carbolic soap, if properly applied, will not only prove to be one of the most efficacious insecticides for the destruction of the Rose-aphid, but for almost every other pest of its species; it would be practically useless to many if dipping the affected parts was the only method of its successful application. Undoubtedly the best means of preparation is to dissolve 1 lb. of carbolic soap in 2 gallons of boiling water, place this in ordinary pint bottles, which should be tightly corked and stored away till required; add one pint of this at any time to four pints of soft water, it will readily become amalgamated, and may be applied morning and evening to the affected trees—it will be seen the pests have become readily destroyed, and the plant's condition considerably improved. *J. H. Walker, F.Z.S.*

THE APOTHECARIES GARDEN AT CHELSEA.—The Apothecaries Garden at Chelsea is in danger of disappearance, for it is announced that the Society of Apothecaries have intimated they are unable any longer to maintain the famous old physic garden, which has been in their possession for over two centuries and a quarter. It is recorded it was in 1673 the original lease was granted to the Society by Charles Cheyne, whose name has been "writ large" in the topographical history of the parish; but from 1721 it has been associated with Sir Hans Sloane, whose statue was erected in the centre of the garden, and whose name may be said to be a household word to all sorts and conditions of Londoners. The conditions under which the garden was made over to the Apothecaries Society were: "That it should at all times be continued as a physic garden for the manifestation of the power and wisdom and goodness of God in creation, and that the apprentices might learn to distinguish good and useful herbs from hurtful ones." Another condition imposed was that each year the Society should present to the Royal Society specimens of sixty new plants until their number reached 2,000. Some records state that the garden was originated by Sir Hans Sloane, and that in 1721 it was by deed of gift by him handed over to the Apothecaries Society, who have owned and maintained it to this day, Sir Hans granting the Society the freehold. From a sense of gratitude the Society erected in the centre of the garden a marble statue of their benefactor, and they also formed a library of botanical works, and added from time to time numerous specimens of dried plants. The statue was executed by Michael Rysbrack. "At the time the garden was formed," writes the author of *London Visited in 1851*, "it must have stood entirely in the country, and had every chance of the plants in it maintaining a healthy state. Now, however, it is completely in the town, and but for its being on the side of the river, and lying open on that quarter, it would be altogether surrounded with common streets and houses." Since these lines were written, the commodious Chelsea Embankment has cut it off completely from the river, and though houses have been built about it, they are in many cases palatial rather than common, though they shut the site in more completely than before. Of late years the appearance of the walls, grass, trees and shrubs, and houses, have become that of most London gardens—dingy, smoked, with certain signs of impoverishment. But it is interesting for its age, for the few old specimens it contains, including the Cedar of Lebanon, which is supposed to be 200 years old. This garden will, in the memories of contemporary horticulturists, be associated with the name of the late Thomas Moore. During the term of his curatorship the list of medicinal plants was extended, the houses were gradually renovated and added to, and the collections of ornamental and useful plants cultivated on the best principles. In spite of the disadvantages of situation, there are still grown many of the plants yielding the drugs found in the *London Pharmacopœia*. An effort is being put forth by certain public-spirited individuals to save the garden to the locality. The Charity Commissioners are being approached to ascertain if they would be willing to sanction its acquisition by the governing body of the City Parochial Charities, and its subsequent maintenance by them as a botanical garden. *R. D.* [Some illustrations of the old garden were given in our number for July 19, 1890. *Ed.*]

A GOOD EARLY PEA.—A few years ago Mr. "Punch" had an amusing article upon his endeavour to select seeds for his garden; his table was covered with catalogues, and no matter what vegetable or flower seed he wanted, each catalogue had some special one of its own to offer, and each of course superior to all others; the joke, of course, had a substratum of truth. Take, for instance, the case of Peas. I wonder what space of ground would be required to grow one row of the different varieties offered from the various catalogues which are obligingly sent to us at the opening of the year. Considering all this perplexity and confusion, I think one is doing a service in drawing attention to one of unquestioned merit. One great effort of seed raisers has been to get a good early Pea; most of those already obtained are white Peas, and deficient both in size and flavour. Last year I received, however, one from Messrs. Sutton, of Reading, under the name of Sutton's "Early Giant" Marrowfat; this seems to be all that is required in an early Pea. It is large, and the pod contains ten or eleven peas. They are green, and of excellent flavour, while it is a most abundant cropper, and the plant runs about

3 feet high. I took a few pods of it to the Drill Hall when Mr. Sherwood gave his lecture on edible Peas, and many a gardener to whom I then showed it agreed with me that it was a most valuable acquisition; and I have no hesitation in recommending it. *Wild Rose.*

GARDENERS' CHARITIES.—I have not entirely followed Mr. Fletcher's correspondence concerning these, but I take it that he more particularly refers, as regards the Gardeners' Royal Benevolent Institution, to those non-subscribers who are so often [Sometimes. *Ed.*] elected pensioners over those who have been subscribers. I myself have always made it a point to give my votes only to those who have been subscribers; and I certainly think that while there are subscribers wanting to be put on the pension fund, non-subscribers should not be entertained at all—but, supposing there should be vacancies for more than the number of subscribers offering themselves, then let any deserving outsiders compete with the others. I think if the rules are strictly conformed to, no ground of complaint could exist. *A. Robinson.* [Most of us will admit that those unfortunate gardeners and their widows who have fallen on evil days in their old age are deserving of our charity. There are many reasons why a gardener has not become a contributor to the funds of the Gardeners' Royal Benevolent Institution; and after all that has been said and written, it is a most fortunate circumstance for him and his that such an institution exists, and that it is carried on upon other than strictly benefit society lines, and it is to be hoped that it never will be. *Ed.*]

RHODODENDRON SMITHII AUREUM.—I was pleased to see the note on this hybrid by Mr. W. J. Bean in your recent issue. It deserves every word of commendation there given, and if it were more often met with its beauty and distinctness would, I am sure, impress and please many who, as yet, do not know the variety. A number of small plants were recently in flower at the nursery of the Messrs. R. Veitch & Sons, Exeter, who have had this form for many years. It is constantly being increased, so that the plants have not attained any great size. Grown in pots, and flowering in the month of May, it comes as a most welcome addition to the early blooming subjects for the conservatory. I am not quite certain if the strong-growing *R. altaclarensis* has been used as a parent in these particular hybrids, if not it would seem to me in this form (a hybrid itself) we have one which, if used with some free-flowering type, would produce a progeny as fine or even better than *r. aureum* itself. *W. Swan.*

ANDROSACE SARMENTOSA WILD IN NORWAY [?].—Mr. Townsend Logan, living at Upton Lawn, near Chester, has a shooting in one of the Lofoden Islands, off the north-west coast of Norway, within the arctic circle. Two years ago Mrs. Logan asked her son to bring home a few rock-plants for a rockery she was making. Amongst them was one which is now flourishing luxuriantly at Upton Lawn, and is beyond doubt *Androsace sarmentosa* (Wallich). I admit the great improbability of a plant hitherto only known to be wild in the eastern Himalayan range being found in an island in the arctic regions of Europe, and it was suggested to me, when two months ago I first received the specimen, and mentioned it to a botanist, that it was perhaps a large form of the European *A. villosa*. I also know that a plant intermediate between *A. sarmentosa* and *A. villosa* was raised by me and others a few years ago from seed distributed by Dr. King, of Calcutta, and collected for him in the Chumby Valley, in Sikkim. This was referred at first by Sir Joseph Hooker to *A. villosa*, but is now generally called *A. sarmentosa* var. *Chumbyi*. The Norway plant in question is, however, in every respect—size, flower, stature, and habit, typical *A. sarmentosa*. The finder submitted to-day to a searching cross-examination made by me, and has no doubt that it is the plant found by him in the Lofoden Islands, and I have no doubt of his good faith. However, I have by this note called the attention of those interested in the distribution of botanical species to his supposed discovery; and Mr. Logan has promised that he will this year, when he revisits his shooting-ground, collect and send home more specimens of the same plant. He informs me that there is not a house within 5 miles of the spot where he collected the plants, a spot about 1 mile from the sea, and perhaps 500 feet above its level. *C. Wolley Dod, Edge Hall, Malpas, July 30.*

A NEW BRITISH ORCHIS: CORRECTION.—In a recent number of the *Gardeners' Chronicle* I made a

somewhat premature announcement that an Orchis, of which several examples had been found by a friend near Arisaig in the West Highlands, had been identified by comparison in the Kew Herbarium with *Habenaria odoratissima*. I had read somewhat carelessly a letter from my son, in which he said that he had sent a specimen to Kew for identification, and that he thought it was *H. odoratissima*. Of course, in a dried-up flower, which had made two or three expeditions by post, the characters were not very clear; but I now hear from him that the best authority on British Orchids at Kew considers the plant to be a hybrid *Habenaria conopsea* × *H. albida*. An apology is due from me to the botanical department, which I hereby ask you to publish. *C. Wolley Dod, Edge Hall, Malpas.* [But what is *Habenaria conopsea*?]

WHAT IS A VIOLA?—At the Glasgow and West of Scotland Pansy Society's exhibition last month, that veteran grower and raiser, Mr. John Baxter, Daldowie, Broomhouse, had a stand of "Violas" disqualified because he had in it a spray of a seedling somewhat resembling Archie Grant. The judges were Mr. J. D. Stuart, the well-known raiser from Belfast, and Mr. Hay, of Linlithgow. Mr. Baxter's stand was disqualified because the seedling referred to was not a Viola in the opinion of the judges. Was this quite fair to Mr. Baxter? I do not think so. Such varieties have invariably been shown as Violas at our Scotch shows for many years, and if they are to be excluded, it ought not to be by the judges on the show day, but by a condition in the prize schedule. What have the National Viola Society or the Viola Conference people to say on the point? *Edina.* [A Viola is a species of Viola; when a divergence is made another name (not Latin) should be applied. *Ed.*]

"BLINDNESS" IN THE STRAWBERRY.—I was much interested in the correspondence in the *Gardeners' Chronicle*, on p. 108, of "Strawberries going blind," as I planted one dozen runners this spring of Monarch, and allowed them to flower, which eight did out of the dozen, the four I pulled up and threw away. This, however, is not peculiar to that variety, for I have had Auguste Nicaise from two-year-old plants that looked strong and healthy, of which three-fourths were blind or flowerless. I should like to hear the opinion of some of your correspondents if the very mild winter had anything to do with it. *J. Barnard.*

PEAS.—I was much interested in Mr. R. Dean's article on Peas at Messrs. Hurst & Sons, but I do not find among the varieties there mentioned that valuable Pea, Sutton's Dwarf Defiance. With me this variety has done splendidly, and outstrips any dwarf variety I have grown here. The pods are as large as Improved Dr. McLean, containing frequently as many as ten Peas, and the flavour equal to that of any Pea I know. I consider it a very valuable Pea to those whose space is limited, and who find it difficult to obtain sticks for tall sorts, as it requires nothing higher than 18 inches or 2 feet. It may be grown either as a second early or main crop. *George E. Parr, Hampton Court Gardens, near Westminster.*

EULOPHIELLA.—In the *Gardeners' Chronicle*, April 2, 1898, is figured a highly remarkable Orchid, *Eulophiella Peetersiana*. Can it be we have to do here with a plant belonging to the large genus of epiphytal or terrestrial Orchids—*Eulophia*? They are natives of tropical Asia, Africa, and America, but occur in greatest numbers at the Cape. They have either pseudo-bulbs, with one or two leaves, or tuberous rhizomes of the size of Potatoes or larger, with the leaves and flower-scapes arising laterally from near the base. The leaves are grassy, or lance-shaped and plaited, and the flower-scapes either single or branched, bearing few or many flowers, which seldom exceed 1 inch in diameter. The prevailing colour is yellow. The sepals and petals are nearly equal, the lip pouched or spurred, with an entire or trilobed limb, bearded or crested in the middle, the column with a terminal helmet-shaped anther-case enclosing the two pollen-masses, with their very short caudicle attached to a rather large diverging gland. *J. W. Heyl; Tjilodur, Botanical Mountain Gardens, Java, July 5, 1898.*

SANDER'S PERFECT ORCHID PAN.—As a reader from my boyhood (over thirty years), and also as an occasional contributor to your pages, I would bring to your notice that this pan Messrs. Sander & Co. claim as something new, has been in use in the East to my knowledge for more than ten years. I was one of the first to have them made, and used them in

growing Orchids and Ferns with great success. They are found in common use in most of the botanic gardens, and with all those who have a good fernery. J. A.

THE CULTIVATION OF EUROPEAN PLANTS IN MEXICO.

AN interesting little article has appeared in the *Revue Générale de Botanique* for July on this subject, by M. L.-G. Seurat. He observes that the mean annual temperature of the town of Mexico is not very high, being only 15° 4' C. (about 60° F.) in the shade. This allows of a certain number of European plants being cultivated upon the table-land, such as corn, garden vegetables; fruit-trees, as Pears, Apples, &c. A large number of common European plants are also to be found in the gardens of Mexico; but, on the other hand, since there is no rainfall for eight months in the year, many European plants cannot be grown. Agaves and Cactaceous plants are the only kinds which can withstand the extreme drought. In places where one can supply water artificially, there are excellent cultivations; for example, in a "hacienda" near Mexico, magnificent crops of corn and Maize are secured—two per annum—by irrigating the fields during the dry season. In other haciendas the Maize is sown towards the end of the dry season in June, and the rainy season following; the young plants have thus an abundance of moisture, and grow rapidly.

On the south-side of the town the cultivation of garden herbs is carried on, but under peculiar conditions. This region was formerly the site of a vast but shallow lake. The Aztecs have recovered some land by the cultivation of Sedges, preserving some inlets where water accumulates. These inlets circumscribe small rectangular islands, which actually float on the water. It is upon these miniature fields where the sowings are made. These floating gardens are called "chinampas." The canal of the Viga, which runs from south to north, from the lake of Xochimilco to Mexico, is hemmed in by these floating gardens.

The Indians row around the chinampas in very narrow canoes, and by means of bowls throw water upon the little beds. The Chinampas are moveable, and it often happens that they are driven against each other by the wind.

The plants cultivated on the floating chinampas are very various—e.g., corn, Barley, Maize, Cabbages, Carrots, Turnips, Artichokes, Leeks, Radishes, &c. Besides these, there are flowers, Roses in particular, and the wild Dahlia. All these plants are carried to the town in large boats, which run down the course of the canal of the Viga. The place south of the town, where the vegetables, forage, and flowers arrive, affords a very picturesque and charming sight.

M. Leurat records here an observation regarding plants with swollen roots. He says that if one sows the seed of cultivated Radishes brought from Europe, one obtains in the shade and in well-watered ground, Radishes like those of Europe; but if, on the contrary, one sows the seed of "the Radish of the country," they grow without any enlargement of the root, for the subterranean stem (hypocotyl) is slender and of a uniform thickness. He thus obtained at the end of two months, in a soil very sheltered, well manured, and watered twice a day, Radishes with well-developed foliage; but of which the hypocotyl only measured 2½ inches in length, and had a uniform diameter of .09 to .1 inch. This axis had the upper part coloured red, corresponding to the portion which ought to have swollen. He supplies an illustration.

The arrest of the swollen part, he adds, is easy of explanation. Mexico, having a uniform temperature from one end of the year to the other, and water being supplied in abundance by the gardener, the plant has no necessity to interrupt its growth during the winter. The winter at Mexico is characterised by cold nights, when the temperature falls to about freezing-point, while the days are warm; and not having need to make reserve food-materials, the Radish loses the habit of making it during the first

year's growth. The seeds of the country form, are, in fact, the seeds of Radishes originally brought from Europe, but which have immediately degenerated in response to the climate. It must, therefore, be constantly re-imported fresh from Europe. The same result occurs with Carrots, Turnips, &c.

Finally, there is another point deserving of observation. It has been supposed that certain European plants transferred to Mexico will not bear seed. Such is not really the case. What suggested the idea is the fact that fruit-trees, notwithstanding great care, as a rule only give very meagre results. M. Seurat believes that it is due to the fact that a large number of flowers are not fecundated in consequence of the absence of the insects necessary to insure pollination. *George Henslow.*

BELGIUM.

A COLLECTION OF CACTI.

DURING a recent visit to the houses of M. Fr. Delaet, at Contich, near Antwerp, I noted *Echinocactus Wislizeni*, 1½ foot across, with all the spines intact; *E. Grusoni*, even larger; *E. cylindraceus*, 1 foot across, with spines 4 inches long, red, and interlacing like snakes; and other plants of the same variety differing in the form and colour of the spines. I also saw *E. Wrighti*, with spines about 5½ inches long, and ending in a hook like those of *E. Wislizeni*.

E. rubrispinus was notable for the red-brown colour of its many thorns; beside it was a fine *E. Hasselbergi*, with four fruits full of seed. There was also a group of *E. ornatus*, the plants covered with small white spots, and having fine yellow spines. *Leuchtenbergia principis*, a very distinct plant: it has leaves or branches from 3 to 4 inches long, ending in a crown of spines or soft prickles, some over 5 inches long.

I was also attracted by *Echinocactus Monvillei*, covered with flower-buds; indeed, all the following plants have flowered, as their fruits prove: *Echinocactus hexaedrophorus*, *helophorus*, *acifer*, *multicostatus*, *m. Dowelli*, *turbiniformis*, *Orcutti*, *tenuiflorus*, *Jussieui*, *xiphacanthus*, *pentacanthus*, *Geissoi*, *longihamatus*; and *Echinocereus robustus*, *stramineus major*, *Röteri*, *rigidissimus*; also various species of *Mamillaria*, *Cereus*, and *Echinopsis*.

A group of *Pilocereus*, including *P. Dautwitzii*, *Hoppenstedtii* and *senilis* deserve mention.

In another house were *Phyllocacti*, bearing fruit, the result of crossing. Certain *Euphorbias* were nearly 6 feet high. M. Delaet also grows Agaves and Aloes well, and has a good plant of *Hechtia Ghiesbreghtii* with four floral racemes, each bearing very many small white blooms.

In the garden were some fine *Cereus*, some 10 feet across. In pans were many seedlings carefully tended; numbers of *Echinocactus Hasselbergi*, *E. m. Dowelli* and *Pilocereus similis*; in fact, about 400 varieties of all species were represented in numbers.

NURSERY NOTES.

MESSRS. WALSHAW & SONS, SCARBOROUGH.

Now that the floral decorations and requirements of a first-class watering-place are no longer a luxury, but what I think might safely be said, a necessity, the undertaking of catering for such an enormous demand as the season at Scarborough entails on the florist requires a large outlay and a great deal of forethought. A visit to the old-established nursery of Messrs. Walshaw during last week showed clearly that, although the tastes of the varied classes of visitors are in many cases quite different, still for all and every one the thing desired seemed to be at hand at this establishment. In passing through some of the many ranges of glass, the following batches were noticed as being larger than one sees usually in provincial nurseries. On entering the main gate, the visitor passes into a very lofty vestibule, tastefully arranged

with decorative and flowering plants, and standing here he is at once charmed by a gorgeous display of what Mr. Walshaw believes to be a coming plant to the florist, namely, a large house full of Cannas; these are arranged on the floor down each side of a wide span-roofed house, and the effect is more telling, as the house being, as it were, built on the side of a hill, and sloping towards the main door, the visitor is enabled to get a full view at once, and the effect is certainly very fine. Grown as one sees them here, it is quite easy to corroborate your correspondent "H. R. W., Stuttgart," who says in your issue of the *Gardeners' Chronicle* of July 16, that the Cannas have risen to a foremost position among summer-flowering plants. Mr. Walshaw, having procured these direct from a noted continental raiser, the collection includes some fine varieties previously unflowered in England. Among the best known kinds at present in bloom was seen Alphonse Bouvier, foliage very fine, and flower vivid crimson; Fratelli Cattaneo, bold red foliage, and very deep crimson flower; Giardino Treves, a clear yellow flower, spotted with very bright red; Moritz Jacob, another good yellow; President Carnot, crimson flowered; Sophie Buchner, a good scarlet; Villa Adda, a dark foliaged variety, with distinct flowers of a bronzy-red colour. Italia and Austria were also noted, showing, among upwards of fifty other varieties, strong spikes; and the house bids fair to give a good display for some time still to come.

Passing into the side ranges, an enormous batch of *Lilium longiflorum* var. *Harrisii* was seen, one house being filled with some hundreds of these just expanding their blooms.

A large span-roofed house of Double Pearl Tuberoses could be detected before you got into it, the powerful scent permeating the houses for some distance, and inside the house containing them so as to be almost overpowering. Many thousands of these are grown in succession, it being greatly in demand. Following this another span-roofed house was crammed with grand Kentias; great numbers of these are sent out for the decoration of the enormous ball-rooms and halls during the Scarborough season. Most varieties of Roses are well done here, but an especially fine lot of Teas, including all the up-to-date varieties, were there; some grand batches of choice Teas in pots were coming on for autumn distribution. Carnations, both border and tree varieties, were strongly in evidence; of the latter class upwards of 10,000 are grown for autumn sale. A plant well worth noting is here grown in quantity, namely, *Asparagus Sprengeri*: one batch in large pots is grown for cutting from, in preference to *Smilax* (*Myrsiphyllum asparagoides*), and when once used I was told it was always requested. A quantity of decorative Ferns were there grown in low, span-roofed houses near the glass, also nice clean batches of *Boronias*, *Genistas*, zonal *Pelargoniums*, &c., for autumn and winter work were coming on. In the nursery department Roses are again well done, and *Souvenir de la Malmaison*, of which one so often sees badly-developed flowers, was here in thousands, of perfectly-formed flowers, a quantity ready cut for sending out, making a grand display.

Among new plants outside were noted two species of *Olearia*, namely, *O. dentata*, a strong-growing shrub, with distinct, serrated foliage of a glaucous covering, and *O. nitida*, a dwarfer shrub, with dark foliage. These will both prove, I think, useful additions for seaside planting.

Large quarters of fruit-trees, Conifers, &c., were also observed in good character. The larger outside nursery, situated at Scalby, some two miles out of Scarborough, is well worth visiting, as it is a pleasant drive out, and can be easily reached from the village of Scalby. The home-nursery being at the end of the valley, one of the favourite walks of the Scarborough visitors, it is very easy of access, and is visited by thousands during the season.

At the entrance to the offices great alterations are just being commenced, the present accommodation being quite inadequate, it is therefore proposed to build new offices to facilitate the despatch of business. *John Clayton.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 26.—*Present*: Dr. M. T. Masters (in the Chair); Mr. Bennett-Poë, Dr. Russell, Mr. Veitch, Rev. George Henslow, Hon. Sec.

Tomatos and Sleepy Disease.—Plants suffering from this now not uncommon complaint were forwarded to Dr. William G. Smith for examination. He reports as follows:—"My observations agree with those of Mr. Massee given in the *Gardeners' Chronicle*, June 8, 1895. I have already seen several cases of this disease this season. I do not see an easy way of getting rid of the fungus. Mr. Massee's suggestion of liming the soil seems a good one, but I have had no experience."

Outgrowths on Potatoes.—Mr. Sutton sent some tubers having curious excrescences upon them, received from Mr. Kerr of Dumfries. They were reserved for examination.

Asters Diseased.—Mr. W. P. Wright, of Fairview, Willesborough, Ashford, Kent, sent some specimens, and observes that "Growers of Asters in East Kent, especially in the Dover district, are in trouble over an Aster disease, which destroys thousands of plants. Some go off directly they are put out, others at a later stage. I found small white grubs in the lower part of the stems, and I do not feel any doubt that they are the cause of the mischief." In the *Naturalist*, the organ of the Yorkshire Naturalists' Union, there is a paper by Rev. Hilderic Friend on this subject. The worms in question are of the family of Enchytreidae, a group of annelids. Mr. Friend discovered a presumably new form in China Asters, and named it *E. parvulus* on account of its minuteness. A full description of the worm is given in Mr. Friend's paper. There is nothing to be done but consign the plants attacked to the flames. An account of the Aster worm will be found in the *Gardeners' Chronicle* for August 14, 1897, p. 89, with figure.

Melon with Seeds Germinating.—Mr. Veitch read a letter from Mr. A. McKellar, gardener to H.R.H. the Prince of Wales, Sandringham, describing a Melon sent to Marlborough House, which was full of young Melon plants, quite green. They were plunging their roots into the pulp, and feeding upon it. Similar growths have often been seen in Lemons and Oranges, as well as Cucumbers, Pumpkins, Papaws, and other fleshy fruits. The cause appears to be that the fruit has been kept some time in a warm atmosphere.

AUGUST 9.—The lessened attendance of visitors, and the comparative paucity of exhibits, marked the end of the season in London, and the waning of summer. Dahlias, Gladiolus, Montbretias, Lilies, and Gaillardias helped to impart gaiety to the Drill Hall; and the fine exhibits of fruits by Messrs. J. Veitch & Sons and Messrs. T. F. Rivers & Son, to afford food for comment by the fruit connoisseurs. Orchids were extremely few in number.

Floral Committee.

Present: W. Marshall, Esq. (in the Chair); and Messrs. John Fraser, O. Thomas, H. B. May, C. T. Druery, R. Dean, G. Stevens, W. Howe, J. F. McLeod, C. J. Salter, C. E. Pearson, J. Walker, C. E. Shea, H. Turner, and J. Fraser.

Her Majesty the QUEEN, Windsor (gr., Mr. Owen Thomas), showed a collection of Nepenthes in considerable variety, in large and small examples. We noted plants of the following varieties with fine pitchers, viz., Amesiana, Mastersiana, Morgania, Mixta, Curtisii and C. superba, Northiana, Burkei, Hookeriana, Dickinsoniana, and Curtisii. Plants of Acalypha Sanderi were interspersed, and Maidenhair Fern formed the groundwork (Silver-gilt Flora Medal). Mr. O. Thomas showed Nelumbium speciosum, var. album, flowers white, with yellow stamens and light green disc (First-class Certificate). (See *Gardeners' Chronicle*, Oct. 1, 1887, fig. 88.) He also showed Abutilon Swarzi, with a pronounced white variegation on the leaf.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, showed a handsome collection of bulbous plants, and cut blooms of the same. We noted of Lilies L. Thunbergianum venustum, a bright orange scarlet flower; L. auratum, L. a. rubro-vittatum, L. a. Witte, a very handsome form, segments white, with a yellow middle-line; L. Henryi, a yellow Turk's-cap, and an abundant bloomer; L. Batemanniae, orange-scarlet; and others. Montbretias formed another feature, and there were M. Gerbe D'Or, M. crocosmiflora, M. c. Soleil Couchant, M. c. Phare, M. c. Etoile de Feu, and M. Pottsi, all very pretty, and in colour, ranging from scarlet to yellow. Various Gladioli were shown, including Souvenir, a bright red; Etna, dark crimson; and Lafayette. The remainder of the group consisted of Tritomas, Carnations, Brodiaeas, including B. Orcuttii, a flower of a bright blue tint; Sternbergia macrantha, a dwarf, bright yellow flower, of Crocus-like growth—very showy (Silver Banksian Medal).

Messrs. KELWAY & Sons, Langport, Somerset, staged a large miscellaneous collection of hardy flowers, and more especially of Gladiolus, in which genus they are *facile principes*. We remarked the pretty blue Statice latifolia, an excellent subject for cutting; Gaillardia Vivian Grey, a beautiful yellow self; Eryngium dichotomum, a pretty, small-flowered species; Bupthalmum salicifolium, Asclepias incarnata, Michauxia campanuloides, flowers large, simple, white, and arranged on a long, stout-branched spike. The Gladiolus consisted of seven stands of choice varieties. A whole stand was set up of new varieties (fourteen), and one only obtained

an Award of Merit, viz., G. W. B. Child, a dull, yet distinct-looking type of flower, of the Nancianus form, in colour a dull crimson, covered with dense spotting. There were several other fine flowers that took the fancy of the visitors in preference to the committee's choice. A Silver Flora Medal was awarded for the Gladiolus.

J. VEITCH & Sons, Limited, The Royal Exotic Nursery, Chelsea, showed a collection of cut blooms of hardy, perennial, and annual plants, a particularly showy lot. We remarked the dwarf hybrid Candytuft "Carmine," very rightly named; Stachys coccinea, rarely seen; the White Spiral Candytuft; Hunnemannia fumariaefolia, a Poppy-like flower of a pure yellow tint; Chrysanthemum luteum, with bright yellow rays, and purplish-brown disc, distinct; Shirley Poppies in variety; Lavatera, in white and pink varieties; the pretty pink-flowered Cosmos bipinnatus; Xeranthemum superbum, Godetia Gloriosa, of the deepest tint of crimson; G. Butterfly, white and crimson, and other Godetias; Scabiosa in variety; the pretty red-flowered Calceola coccinea, and Chrysanthemum inodorum plenissimum. The firm showed Carnation George Maquay, a white flower of fair quality, apparently an abundant flowerer. The petals are cupped, smooth, and numerous, and it is likely to be an excellent border variety. Forming part of their exhibit was a quantity of growths with flowers thereon, of Cornus macrophylla, of Eueryphia pinnatifolia, Pavia macrostachya, and Coprosma acerosa with small blueish berries.

Mr. M. PRICHARD, The Nurseries, Christchurch, Hants, showed a large collection of hardy herbaceous perennials as cut flowers, rich in diverse genera. Conspicuous was the violet-coloured Gladiolus Lemoinei Baron J. Hulot (Award of Merit), G. L. Venus de Milo, G. L. Etoile, and G. L. Vesuvius, of a rich crimson (Award of Merit); it is distinguished from all other varieties by its great length of spike, and consequently large number of flowers; the now rarely-seen Zauschneria californica, like a miniature Pentstemon; Dracocephalum virginianum, the blue-flowered Aconitum bicolor, Potentilla Hopwoodiana, Lobelia Milleri, the slow Helium grandicephalum striatum, Podophyllum Emodi, with two fruits (scarlet drupes), Peotstemon heterophyllus, Asclepias syriaca, A. tuberosa, and A. incarnata, besides a quantity of ordinary border species (Silver Banksian Medal).

Messrs. W. CUTBUSH & Son, the Nurseries, Highgate and Barnet, showed a collection of Sweet Peas too thickly set up, mostly consisting of new varieties, Phlox of new varieties and rich colours, bunches of Carnations and Picotees, &c. (Bronze Banksian Medal).

Messrs. W. PAUL & Son, Waltham Cross, Herts, had an extensive array of shrubby Phloxes in the best varieties, of which we may name M. Thibaut, rosy-crimson; Adonis, cerise; Hecla, violet and white; Oriental, lilac; Lotohair, rosy-crimson; Auguste Riviere, deep crimson; Fantome, violet and white centre; Lord Raleigh, deep blue; Le Mahda, rather deeper in tone; and Roxelane, rich red-purple. At the back of the table they had arranged a number of Hollyhock spikes, some of the flowers attaining to the florists' ideal. They also exhibited a quantity of flower-spikes of Yucca flaccida; and a seedling Yew named Waltham Golden, two plants 5 feet high. The variegation is effective, and the habit is reminiscent of the Irish Yew (Silver Flora Medal for the entire exhibit).

Messrs. WEBB & BRAND, Saffron Walden, showed Hollyhocks in variety, and they received a Bronze Flora Medal.

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, filled a considerable amount of table with species and varieties of Nephrolepis, including rufescens var. triplinatifida, N. acuta, N. Faulkneri, a number of N. pectinata, arranged on a branching tree-stem very effectively; N. exaltata plumosa, and the type form, &c. (Silver-Gilt Banksian).

Messrs. SANDER & Co., St Albans, Herts, showed as new plants Begonia gemmata and B. conspicua, both being ornamental-leaved varieties of cissimil characters; and Furcraea Watsoniana (First-class Certificate), a plant with widely-expanded leaves of 3 inches in breadth and 2 feet in length, becoming horizontally poised as they get older; the central portion of the leaf consists of a creamy-white band, and a narrower band runs along each side at a quarter of an inch distant (see *Gardeners' Chronicle*, April 23, 1898, p. 243).

R. SISLEY, Esq., Ockford, Godalming, showed Carnation blooms, but none was recognised by the committee.

Border Carnations in variety were shown by AUBREY SPURLING, Esq.

Codium Wentworthianum was shown by Mr. Hughes, gr. to Lord FITZWILLIAM, Wentworth Woodhouse, Rotherham, said to be a cross between interruptus and Weissmanni. It was showy in its yellow and green.

Mr. J. DOUGLAS, Edenside, Great Bookham, Surrey, showed a number of Carnation seedlings of fine quality, but the only one graced with an Award of Merit was a very dark crimson flower named Nox, raised by Mr. Martin Smith; eighteen varieties were of Mr. Smith's raising, and four Mr. Douglas's.

Mr. STEPHEN TRESEDER, Nurseries, Cardiff, showed Tea Rose Mrs. Stephen Treseder, a creamy-white variety, of a form somewhat resembling Niphetos.

T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr., Mr. Salter), showed Chrysanthemum Mlle. Marie Masse, the natural growth of which was said to be 2½ feet high, and the habit compact. The colour of the bloom is light-rose, whitening with age (Award of Merit).

Mr. J. CROOK, gr., Forde Abbey, Chard, showed a quantity of flowers of Gloriosa grandiflora.

A. B. FREEMAN-MITFORD, Esq., Batsford Park, Moreton-in-the-Marsh, exhibited, floating in broad pans of water, twelve varieties of Water-Lilies, viz., Nymphaea Marliacea chroma-

tella, pale-yellow; N. flammea, crimson; N. Marliacea albida, N. Marliacea rosea; N. gloriosa, N. fulva, N. odorata, N. ignea (Award of Merit), N. Laydekeri, and N. rubro-punctata (A Silver Flora Medal for the collection).

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House Acton (gr., Mr. J. Hudson), exhibited a tray of Water-Lilies, including Nymphaea gloriosa, N. Seignouretii, pink; N. Andreana, crimson; N. odorata sulphurea grandiflora, white and yellow; N. alba, N. odorata rosea, N. Laydekeri fulgens, crimson; N. lucida, N. aurea, N. Marliacea chromatella, &c., N. stellata, blue, grown out of doors, and others, in all 24 varieties (Silver Banksian Medal).

W. ROBINSON, Esq., 63, Lincoln's Inn Fields, W.C., showed a panful of flowers of Nymphaea alba, N. chromatella, N. rosea, N. albida, &c., in fine stages of development (Bronze Flora Medal).

LORD HILLINGDON, Hillingdon Court (gr., Mr. Allen), showed thirty-six bunches of border Carnations, most of which were of more than ordinary good quality as such, and the colours most varied (Bronze Banksian Medal).

Mrs. ABBOTT, South Villa, Regents Park, N.W. (gr., Mr. G. Kelf), showed a large group of stove-plants, mostly foliage, enlivened by Lilies and Cannas, and of which Palms and Caladiums formed the back rows (Silver-gilt Banksian Medal).

EARL PERCY, Syon House, Brentford (gr., Mr. G. Wythes), showed about forty plants of white and blue-flowered Campanula pyramidalis, capitally grown and flowered in 8-inch pots from seed sown eighteen months ago (Silver Banksian Medal).

Dahlias.—Retarding as the summer season has been, with its alternations of heat and cold, sunshine and darkness, Dahlias have come on, and a good many blooms were produced on Tuesday last, including the show Cactus and Pompon varieties. Mr. J. WALKER, nurseryman, Thame, had a collection of sixty show varieties. The blooms were small, because we are in early August, but the quality of many was decidedly good. By drawing an inference from this collection, it may be said that the following varieties are likely to be seen in good character when the show season comes on: The Hon. Mrs. P. Wyndham, Nubian, Plutarch (fancy), Mr. J. Harris, Ethel Britton, a flower of great delicacy; Goldsmith, W. Powell, and R. T. Rawlings, two of the most useful yellow selfs; Arthur Rawlings, S. Mortimer (fancy), John Wyatt, Mrs. Gladstone, one of the most constant of show Dahlias; T. J. Saltmarsh, John Standish, deep bright scarlet, and Willie Garratt. Then of Cactus varieties, this well-known firm had some thirty-six blooms, those of the best Cactus character and forming also a collection of most desirable varieties were: Starfish, one of the very best; May Service, Britannia, Night, Arachne, Alfred Vasey, Capstan, and Ruby. Then some bunches of pretty Pompon varieties formed part of the Thame collection: Hypatia, Opal, Sammy Keith, Darkness, and Bacchus (Silver Banksian Medal).

Mr. S. MORTIMER, Swiss Nursery, Farnham, another well-known grower, had a collection of show and Cactus Dahlias. The best among the former were Lottie Eckford, Rebecca in a self form, Perfection, W. Powell, John Walker, John Hickling, another good yellow self; and Duchess of York. Some of his Cactus varieties were remarkably good; out of seventy-two blooms the following were the very best:—Charles Woodbridge, Harmony, Britannia, Arachne, Lady Penzance, and Starfish. There is every reason to believe the next two or three years will see a remarkable break in the Cactus type. Beautiful as are such refined forms as Charles Woodbridge, Starfish, and others, flowers of the Arachne type, with long, thin, pointed florets a little twisted are likely to come to the fore. There is a marked individuality of character about them, and an elegance in their very eccentricity of development. A good white is a great desideratum. Keynes' White is the best to-day, but like all the white Cactus varieties, it is apt to come flat-petalled. The coming season will witness the advent of many novelties in Cactus Dahlias (Silver Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. J. Chapman, W. Cobb, E. Ashworth, J. Jacques, E. Hill, J. Douglas, H. M. Pollett, H. Ballantine, and J. Gurney Fowler.

Though but few exhibits were staged, three subjects worthy of awards were found. Baron Sir H. SCHRODER, The Dell, Staines (gr., Mr. H. Ballantine), showed flowers of Sobralia Sanderiana, an imported species, with flowers nearly as large as those of S. macrantha. The sepals and petals were French white, tinged with rose; the tube of the lip similar in colour to the petals, the throat orange, and the broad front of the lip claret-crimson; a distinct and showy species (Award of Merit). Baron SCHRODER also showed a spike of the original Cypripedium Stonei platytanum.

Capt. G. W. LAW-SCHOFIELD, New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Shill), showed Odontoglossum crispum Lehmanni, Schofield's variety, a charming novelty of the typical shape of Lehmann's O. crispum, which has uniformly displayed segments and a broadly ovate labellum, totally different from that of any other form. The sepals were white, slightly tinged with rose, and each bearing from three to five dark, ruby-red spots. The broad, flat lip, which was slightly toothed at the margin, was of a bright ruby-red, broadly edged with white, and bearing a cowslip-yellow crest, with some fine purple lines (Award of Merit).

Messrs. HUGH LOW & Co., Bush Hill Park, showed Cypripedium × Olivia (tonsum × concola), a distinct hybrid, in form much resembling C. tonsum, but of a clear ivory white, slightly tinged with rose (Award of Merit); a grand form of Oncidium papilio, closely resembling that figured as O. P. Eckhardt; two plants of Cattleya Gaskelliana alba, and one of a fine dark form of the same species.

M. E. ZÖLLINGER-JENNY, Villa Greten, Wollishofen, near Zurich, sent *Vanda Sanderiana rosea*, a noble form, with the petals and the upper sepal of a warm, light rose colour, with a few claret spots at the base, the lower sepals and lip being veined and tinged with brownish-claret colour.

Captain THOS. A. JULIAN, Woodside, Plymouth, sent a very peculiar light form of *Cattleya Warszewiczii* with bluish-white flowers mottled slightly with rose colour, instead of the dark purplish hues usually seen in the species. Mr. JAS. DOUGLAS, Great Bookham, Surrey, showed *Dendrobium formosum*, Edenside variety, with very large white flowers, having rich orange markings on the lip. T. B. HAYWOOD, Esq., Woodhatch, Reigate (gr., Mr. C. J. Salter), showed a fine spike of *Staurosis lissochiloides* (*Vanda Batemanii*).

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. F. F. Rivers, R. Parker, M. Gleeson, J. H. Veitch, G. Bunyard, J. Cheal, J. Wright, A. Dean, W. J. Empson, G. Wythes, J. Balderson, F. Q. Lane, G. Reynolds, G. Norman, R. Fife.

Mr. J. Crock, gr. to — EVANS, Esq., Forde Abbey, Chard, sent a handsome green-flesh Melon, named Forde Abbey Seeding, but it was not sufficiently ripe.

Mr. Capp, gr. to Sir W. PEARSON, Crawley, sent a pair of Melons, Capp's seedling, but these were soft and over ripe.

From Mr. BLAKE, The Gardens, Clandon Park, Guildford, came a dish of fine *La Versailles* red Currants. The committee regard "Comet" from Jersey, shown at the previous meeting, as the same variety. It was desired that both should be tried at Chiswick.

Messrs. KELWAY & SONS, Langport, Somerset, sent small plants about 12 inches in height (of what they term the Strawberry Raspberry (a Japanese species of *Rubus*), and also some gathered fruits. These are about the size and have much the appearance of large *Arbutus unedo* fruits, but they are redder, softer, and sweeter, yet comparatively devoid of flavour. That is unfortunate, as the fruits are handsome, and if well flavoured would be a good addition to the dessert. The committee wished to have further information as to its origin, regarding it rather as a species of *Rubus* than a hybrid. The foliage is small and lanceolate, rather like the Raspberry, but the stems are spiny, like those of the Blackberry. The fruits are borne singly and erect, and not in clusters. No award was made to it.

Mr. CARMICHAEL, Edinburgh, sent a dish of his new Strawberry Britannia, but a distressingly poor sample. The fruits seem to have fair flavour, and to be late, but it needs to be grown in the south to secure a fair trial.

Messrs. JAS. VEITCH & SONS, Ltd., sent a quantity of branches of their new hybrid Raspberry. This is the product of crossing *Belle de Fontenay* Raspberry with the common Blackberry. The plants have strong Raspberry-cane-like growth, but the stems are spiny. The fruits are borne on laterals freely, like Raspberries, but are nearly black; are large as fine Strawberry fruits, but more acid. The fruits do not part from the stem readily, therefore will not bear pulling as Raspberries do. It is an interesting hybrid, and it may be capable of improvement.

Finally came from Messrs. VEITCH & SONS the most remarkable collection of bush-fruits ever seen at any time. Not only were their numbers, but the samples were exceptionally good. It was no wonder that the committee unanimously recommended the Award of a Gold Medal to this superb collection. It included 106 wooden trays of Gooseberries, distinct; 12 the same of red Currants, 6 of white ditto, and 6 black, with one pink variety. There were also various early Apples and Cherries, and some fruiting-branches of Gooseberries; and red and white Currants were also staged. During the afternoon, so attractive were the Gooseberries, that their merits for the table were severely tested. The result seemed to be that most were regarded as being first-rate; certainly, after seeing this collection, it will be no wonder if very great stimulus be not given to the cultivation of what is the most profitable, wholesome, and delectable of all bush fruits. Of small reds, delicious were Early Red Hairy, Warrington, Champagne, Scotch Nutmeg, and Ironmonger. Of small yellows, Rumbullion, Golden Drop, Yellowsmith, Yellow Champagne, Early Sulphur, and the new pale Langley Gage, one of Mr. Seden's best-flavoured varieties. Of small greens, Hedgehog, Pitmaston Greengage, Early Green Hairy, and Green Gascogne. Of large reds, Forester, Dan's Mistake, Crown Bob, Lancashire Lad, Whinham's Industry, Duke, Highlander, Askender Bey, Haslem, Talfourd, Beauty, Lord Derby, Lion's Provider, and Sion were very fine and well coloured. Of large yellows and whites, Langley Beauty, very handsome and rich flavoured, also of Mr. Seden's raising, High Sheriff, Tiger, Pretty Boy, Gipsy Queen, Careless, Railway, Drill, Hit or Miss, Leader, and Great Eastern; and of large greens, Whitemith, Gretna Green, Progress, Ostrich, Success, London City, Jenny Lind, Stockwell, and Ledgermain. The finer red Currants were Cherry, *Le Versailles*, *La Constante*, and Warner's Grape. Of whites, White Crystal, Transparent, Dutch, and Dutch Cut-leaved; and of blacks, Baldwin, Lee's Prolific, and Black Grape.

Mr. W. ROUPPEL, Norwood, brought dishes of Apples Gladstone, ripe, and quite pleasant eating; and Noble Peach, the latter not yet ripe. A vote of thanks was awarded.

Mr. AMIES, Ashford, sent an ordinary sample of Scarlet Runner Beans.

Mr. A. DEAN brought a very handsome sample of White Snowball Turnips to show that the variety named Model, granted an Award of Merit at the previous meeting, was but Snowball. The sample now brought was a better one than the one seen the previous meeting. It was suggested that a

trial of Turnips be sown now at Chiswick. Several varieties of dwarf Beans were sent up from Chiswick, but the committee wished to see them growing in the gardens. Messrs. HARRISON & SONS, Leicester, sent a collection of twenty assumed named varieties of Broad and Long-pod Beans; the best were Emperor a Green Long Pod, Exhibition Long Pod, Leviathan or Seville, Green Windsor, and Harlington Windsor. The types, however, were few (a Vote of Thanks was awarded).

Mr. J. Miller, gr. to Lord FOLEY, Ruxley Lodge, Esher, was awarded a Silver Knightian Medal for a handsome collection of fruit, including good Melons, Sutton's Imperial, Blenheim Orange, and Hero of Lockinge. Peaches: Royal George, Alexandra, Noblesse, and Violet Hative, from under glass; and Waterloo and Alexander, from outside walls. Fine Early Orange, and Hemphirke Apricot, Morello Cherries, Jefferson Plums and Gooseberries.

A very interesting collection of fruit was staged by Mr. Kelf, gr. to Mrs. ABBOTT, South Villa, Regent's Park, and a Silver-gilt Knightian Medal was unanimously awarded. This collection, whilst so excellent, had the merit of being grown within two miles of Charing Cross. There were fine trees in pots carrying heavy crops of fruit of Jefferson, Emperor, and Coc's Golden Drop Plums, and dishes of these with McLaughlin's Gage, Yellow Magnam Bonum, Transparent Gage, Kirko's Reine, Claude de Comte Althaus, and Green Gage Plums, all capital samples; also fine Royal George Peaches, several dozens; and Barrington and Bellegarde do.; Monarch and Seedling Melons, &c. This collection did the grower high credit.

Messrs. T. RIVERS & SON, Sawbridgeworth, had Superb Cherries and Early Rivers' Nectarine. The Cherries were Geant de Hedelfrangers, wonderfully fine; Blackheart, Bigarreau de Guben, Monstreuse de Mezel, Emperor Francis, and Olivet; also, there were fine Golden Transparent and Grand Duke Plums. A Silver Banksian Medal was awarded.

REDHILL, REIGATE, AND DISTRICT CARNATION AND PICOTEE.

JULY 29.—The first show of the above Society was held in the grounds of "Caberleigh," Redhill, on the above date, and judging by the number of competitors, and the high quality of blooms staged, the show could only be pronounced an unqualified success. Nor could this be otherwise, represented as it was by such giants of the Carnation world as Mr. Martin Smith, of Hayes (whose blooms were, as usual, splendidly staged by Mr. Chas. Blick); Mr. Jas. Douglas, of Great Bookham; Mr. Harry Turner, of Slough; and Mr. Robert Sydenham, of Birmingham; together with most of the leading amateur growers in the South.

It is much to be regretted that the day was very cold, and although the threatening rain did not descend, it was more like March than July, and the attendance was therefore not so good as it might have been.

In class 1, for twenty-four blooms, selfs, fancies, bizarres, or flakes, Mr. MARTIN R. SMITH was a good 1st, with a splendid stand of Purity, Don Carlos, Mrs. Grey Buchanan, Cecilia, Bomba, Helmsman, Nora Creina, Alexandra, also a sport from the latter, Blondin, Olga, The Cornet, Hidalgo, The Naiad, Goldilocks, Orion, St. Albans Seedling, Gordon Lewis, Rheims, Rob Roy, Autocrat, and Geo. Neville.

In class 2, for twelve Picotee blooms, white or yellow ground, Mr. MARTIN SMITH was again well to the front, with superb blooms of Lily Duchess, Badminton, Duke of Alva, Lady Bristol, Dinorah, Hesperia, Heather Bell, Hygeia, Edith Volage, His Excellency, and Fashion.

In class 3, for twelve Carnation blooms, Mr. A. J. ROWBERRY, of South Woodford, was 1st, with Orestes, Mrs. Sidney H. Diver, Dick Donovan, Cardinal Wolsey, Geo. Cruickshank, Mrs. Eric Hambro', Endymion, Ceres, Mrs. Prinsep, The Czar, Monarch, and Miss Audrey Campbell.

In class 4, for twelve Picotees, white or yellow ground, Mr. S. A. WENT turned the tables on Mr. A. J. ROWBERRY, beating him with a capital stand of Badminton, Dervish, The Gift, Alice Mills, Voltaire, Golden Eagle Seedling, Florrie Henwood, Favourite, Jessie, and Mrs. Sharpe.

Class 5, for six Carnation blooms, Mr. AUBREY SPURLING, of Blackheath, was 1st.

In classes 7 and 8, for three Carnation and three Picotee blooms respectively, Mr. B. A. M. MORRIS, of Merstham (the Hon. Secretary of the Society), carried off the principal honours. Mr. R. SYDENHAM brought (as an experiment) most of the blooms with which he had taken the leading prizes in the single-bloom classes at the Crystal Palace on the preceding Wednesday, his idea being that owing to the cold the blooms had very slowly developed, and would consequently last longer when cut. The theory was borne out by the result, for he nearly cleared the board with them in the corresponding classes here.

For a vase of Carnations, &c., Mr. S. A. WENT was to the front with a splendid exhibit. For three sprays of Carnations, Mr. A. J. ROWBERRY was 1st.

Mr. AUBREY SPURLING carried off the Challenge Cup for twelve varieties of Carnations, three trusses of each; and the special prizes offered by Mr. R. Killick for twelve Carnation blooms cut from the open border, and staged without dressing, were well contested, and taken by Mr. U. V. CHARRINGTON, Dr. HADLEY, and A. J. ROWBERRY.

For the best table decoration, Mr. ST. B. SLADEN was 1st. Mr. CUTBUSH, of Highgate, staged a large collection of Sweet Peas and Carnations; Mr. F. G. FOSTER, of Havant, a magnificent stand of Sweet Peas; Mr. H. V. CANNELL, of Swanley, Cannas, Sweet Peas, and Carnations; and Mr. JAS.

DOUGLAS, a fine exhibit of new Carnations. Last, but not least by no means, was a lovely group, set up by the permission of LILY, Duchess of MARLBOROUGH, consisting of Malmesbury Carnations, foliage plants, and Ferns.

NORTHAMPTON HORTICULTURAL.

AUGUST 1, 2.—This Society is to be congratulated upon the splendid exhibition which was held in the grounds of Althorp Park by kind permission of the President of the Society, Lord Spencer, K.G. Liberal prizes were offered, and, considering the late character of the season generally, the exhibits were very fine, the general opinion being that the show was the best of those held in recent years, the stove and greenhouse plants and the groups being particularly commendable.

Plants.—For twelve stove and greenhouse plants, 1st, Mr. JAMES CYPHER, of Cheltenham, with huge plants of *Kentia Belmoreana*, *K. australis*, *Latania Borbonica*, *Croton montefontanensis*, *C. Victoria*, *Statisia profusa* (very fine), *Stephanotis floribunda*, and some good *Ixoras*, Prince of Orange and Williamsii. He was closely followed by Mr. FINCH, Coventry, with a collection consisting of *Latania borbonica*, *Kentia Fosteriana*, *Cycas revoluta*, *Kentia australis*, *Erica Parmentieriana*, *Allamanda grandiflora*, *A. nobilis*, *Bougainvillea glabra*, with some good *Codiaeum*, and *Statisia profusa*. Mr. VAUSE, Leamington, was 3rd, with some fine *Kentias*, *Codiaeums*, and *Allamandas*.

Groups.—For a group of miscellaneous plants arranged for effect, in a space of 20 by 12 feet, Mr. J. CYPHER was likewise 1st, with a group tastefully arranged with a Phoenix in the centre, and around it *Humea elegans*, *Codiaeums* in variety, *Caladiums*, *Lilies*, *Orchids*, *Oplismenus*, *Francoa ramosa*, *Asparagus*, *Ferns*, *Pilea muscosa*, and *Palms*, making a very graceful group that was much admired. Mr. VAUSE, Leamington, was 2nd, with a group consisting amongst other things of cork bridges, but it was much heavier in arrangement, in fact, too many plants were employed. In this group a plant of *Acalypha Sanderiana* was noted, the other plants consisting of *Humea elegans*, *Lilies* in variety, *Hydrangeas*, *Dracenas*, *Anthuriums*, *Ixoras*, *Adiantums*, &c.

For Six Exotic Ferns, Mr. W. Pearce, gr. to S. LODGE, Esq., Floore House, was 1st, with grand specimens of *Adiantum cuneatum*, *Dicksonia arborescens*, *D. antarctica*, *Platynerium alcorni*, *Davallia Mooreana*, and *D. fijiensis*; Mr. COPSON was 2nd, his collection containing a good specimen of *Gymnogramma chrysophylla*.

Six Stove and Greenhouse Plants.—In this competition, Mrs. PHIPPS (gr., Mr. COPSON), was 1st, with *Kentia Belmoreana*, *Livistonia chinensis*, *Dracena indivisa*, *Swainsonia Osborni* var. *alba*, *Pelargonium Alexandra Dupree*, and *Stephanotis floribunda*; Mr. PALMER was 2nd, with a lot which included a good plant of *Kentia Fosteriana*.

For Eight Table Plants, Mr. HOLLAND was a good 1st, with nice plants of *Bougainvillea Sanderiana*, *Cattleya Gaskelliana*, *Pandanus Veitchi*, *Geonoma gracilis*, *Codiaeum Golden Ring*, *C. Aigburthianse*, and *Dracena Jamesi*. Mr. COPSON had the best *Coleus*, and Mr. BEARD was 1st for *Fuchsias*, and Mr. REEVE took premier honours for single-flowered *Begonias*, and Mr. COPSON was again 1st for zonal *Pelargoniums* and for *Gloxinias*, and Mr. REEVE was 1st with *Cockscombs*.

Table Decorations, Cut Flowers, and Bouquets.—For the best arrangement for table decoration on a space 9 feet by 5 feet, Lord RENDLESHAM, Rendlesham Park, Suffolk (gr., Mr. H. Roger), was 1st, with a beautiful arrangement of yellow and pink-flowered Carnations, *Asparagus plumosus*, and Grasses arranged with six dishes of fruit, consisting of Grapes, Nectarines, and Figs. The table was much admired for its lightness, and the nice blending of the colours. There were several competitors, Mr. CYPHER being 2nd, and Mr. JAMES 3rd. This class has increased very much in popularity here the last few years. Messrs. JOHN PERKINS & SONS, Northampton, showed the best bouquet, and were followed by Messrs. THOMAS PERKINS & SON, Northampton.

Roses.—The best twenty-four Roses were shown by Messrs. J. PERKINS; Messrs. THOMAS PERKINS being 2nd. Messrs. THOS. PERKINS & SONS, Northampton, was likewise 1st for twelve Teas.

The non-competitive stands attracted much attention, Messrs. JOHN PERKINS having a good stand of Sweet Peas, *Lilium auratum*, herbaceous flowers, &c.; Messrs. THOMAS PERKINS had a very similar group; and Messrs. HINTOS, Warwick Nurseries, had a good stand of Sweet Peas, which tends to show how very popular this pretty sweet-scented flower is in the Midlands; other groups were staged, but want of space will not permit me to give them the attention they deserve.

Fruit is invariably well shown at this show, and this year it was very good. For a collection of eight varieties, open to all England, the Earl SPENCER (gr., Mr. S. Cole) was 1st with a huge Melon, *Ingestre Hybrid*, rather too large; Grapes Muscat of Alexandria and Madresfield Court, very fine in form and colour; Lord Napier Nectarine, Queen Pine, Prince of Wales Peach, Sir Joseph Paxton Strawberry, and Brown Turkey Figs. The Marquis of NORTHAMPTON (gr., Mr. J. Hayes), was 2nd.

For six dishes of fruit, Pine excluded, Mr. COLES was again 1st, with *Ingestre Hybrid* Melon, Madresfield Court, and Muscat of Alexandria Grapes, Pitmaston Orange Nectarine, Barrington Peach, and Brown Turkey Fig; Mr. HAYES was again 2nd.

For three bunches of black Grapes, Mr. CHILD was 1st, with good bunches of Madresfield Court, and he was also

1st for three bunches of white Grapes, having good Muscat of Alexandria.

Mr. HOLLAND took chief honours for six Peaches, and also for six Nectarines. Mr. HAYES had the best Raspberries; Mr. COLE was 1st for Cherries; and Mr. KIGHTLY was 1st for Strawberries; for Gooseberries Mr. KIGHTLY was again 1st, and Mr. F. Hayes took chief honours for Currants.

Vegetables.—There is always a strong competition in the vegetable section, and this year was no exception. For a collection of twelve kinds, Mr. B. WENTWORTH VERNON, Stoke Bourne (gr., Mr. Dymock), was 1st with a fine collection of the following varieties:—Cauliflower Autumn Mammoth, Blood-red Beetroot, Autocrat Pea, Cranston's Excelsior Onion, Matchless Cucumber, Early White Milan Turcip, James' Intermediate Carrot, Giant White Celery—very good; Best-of-All Runner Beans, Globe Artichoke, Supreme Potato, and Perfection Tomato. The Earl SPENCER was placed 2nd; his collection was superior in Carrots and Onions.

For a collection of nine kinds, open to Northamptonshire, Mr. B. WENTWORTH VERNON was again 1st with good specimens of much the same varieties as those noted in the larger class, but including Pea Magnum Bonum—very good; and French Bean Canadian Wonder. Mrs. PHIPPS had the best Tomatoes; Mr. KIGHTLY was successful in Sutton's competition, and Mr. DYMCK was 1st in Messrs. Perkins' and Messrs. Wells' prizes.

The Amateurs' and the Cottagers' competitions were well contested. Too much praise cannot be given to the officials and Mr. Troup (the hon. sec.) for the labour bestowed in bringing the show to a successful issue; and the labours of the judges met with very general satisfaction. H. K.

THE ROYAL SCOTTISH ARBORICULTURAL IN THE FOREST OF DEAN.

AUGUST 2.—The members of the above society arrived at Speech House Road shortly before midnight on the above date, proceeding thence by road to the neighbouring hotel. The accommodation being limited, part of the company camped out at the rear of the hotel in tents provided for the occasion.

An early start was made on foot the following morning to the Kensley enclosure, for the purpose of inspecting the process of regenerating the Oak by means of planting out lines of seedlings in openings made by the removal of badly thinned trees. Naturally enough, criticism was the order of the day; and after allowing for the provisions of the working-plan drawn up by Mr. Hill (of the Indian Forest Service) in 1897, it seemed to us that a bolder system of felling was necessary to obtain satisfactory results. The Larch is also being extensively planted, and appears to thrive remarkably well in the district generally. In the afternoon a long drive in the Ruardean district was taken, the nature of the country necessitating long journeys on foot where the brakes were unable to proceed. The party was joined by Mr. Stafford Howard, Commissioner of Woods and Forests, who appears to have the working of the forest at his finger-ends.

The chief feature of arboricultural interest during this day's tour was the fine Oak in the Lining Wood, which is being felled, with a view to natural regeneration, as laid down in the working plan of Mr. Hill. On Thursday, the 4th inst., an early start was made for Newland, the great Pollard Oak adjoining the village being inspected on the way. This tree resembles a gigantic butcher's block, surrounded by a low crown of foliage. It has an approximate circumference of 56 feet, and is quite hollow, its age being a matter of speculation only. A move was next made to the "Buckstone," a huge mass of conglomerate, which was originally so finely balanced as to rock when pushed, but at last was pushed once too often, and was dislodged from its perch, although it has since been replaced. The view from this stone of the surrounding forest, the Welsh hills, and the winding Wye, is magnificent. High Meadow Woods were next visited, in which some entomologists of the company made an interesting find in the shape of *Postrichus* hidens on a recently transplanted Cedar. The High Meadow estate being a freehold of the Crown, the woods are more heavily stocked with timber and coppice than the forest proper, and ought to yield a good return during the next half-century. The far-famed Symons Yat was reached shortly before noon. From this point the excursionists took boat down the Wye to Monmouth. The route next taken followed the valley of the Wye in the direction of Tintern Abbey, passing through the well-wooded property of the Duke of Beaufort. This portion of the route was equal to any in point of picturesqueness, the steep wooded slopes, in all their summer beauty, forming a scene which could scarcely be surpassed. After a short halt at the Abbey the return journey was made *via* St. Briavels and Parkend.

The following day some of the fine timber in the older parts of the forest was inspected. In the Church Hill enclosure, in the neighbourhood of Parkend, some very fine Oaks still remain, one in particular, above the village school, being much admired. The Forest Museum was visited, and the most highly prized specimen of the collection taken out for the Society's inspection. This proved to be a small Oak-stem, concerning which a curious tradition still lingers amongst the Crown woodmen to the effect that the tree was once stripped entirely of its bark by lightning, and then, in some way not explained, covered uniformly with new wood. The general opinion of the arboriculturist was, however, that it was merely a somewhat unusual instance of ring or cup-shake—an opinion which appeared to be rather

unwelcome to the officials present. The Danby Beeches proved to be some of the finest trees in the forest, the largest measuring some 18 feet in circumference. The return to the Speech House was made *via* Littledean, the best-preserved portion of the old Roman road to Soudley being in pected *en route*, thus bringing to an end what was generally admitted to have been a most enjoyable outing.

At the annual dinner of the Society on Wednesday evening, the principal speakers were Mr. Munro Fergusson, of Novar, M.P.; Mr. Stafford Howard, one of H.M.'s Commissioners of Woods and Forests; Colonel Bailey, R.E., Edinburgh; Professor Somerville, Mr. J. Watt, of Carlisle, and others. The general opinions expressed were in favour of the State assisting the cause of British forestry by the establishment of model forests and the improvement of the Crown woodlands.

On Friday evening the Society was honoured by the presence of Sir James Campbell, late deputy-surveyor of the forest, who referred in the course of an interesting speech to the experiments carried on by himself and his predecessor regarding the transplantation of large Oak and other trees, concerning which a lengthy controversy had been carried on many years ago in the *Gardeners' Chronicle*. The northern section of the Society left by special train for Edinburgh on Saturday morning, the best thanks of the excursionists being due to Mr. Robert Galloway, the Secretary, by whom the arrangements were carried out. A. C. Forbes.

SCOTTISH HORTICULTURAL.

AUGUST 2.—The usual monthly meeting was held on the above date. As the Arboricultural Society, whose members are considerably mixed with this, held their annual meeting in the same rooms, 5, St. Andrew Square, Edinburgh, at 10 A.M., on the same day, and some eighty members started for the Forest of Dean about 12 noon, some thought the evening meeting would be there. But there was a large attendance under the genial and able Presidency of Mr. M. Todd at 7.30.

The paper for the evening was communicated by Mr. W. Boyd, late of the Glen, and well read by the Assistant Secretary. The subject was the general cultivation of Orchids for cut flowers, dealing principally with such Orchids as are of a decorative character, and that bloom in autumn, winter and early spring. The paper was of a practical character, showing Mr. Boyd to have a thorough practical grasp of the subject, and revealing a minute knowledge of the cultural needs of the various genera and species. A very interesting discussion ensued at the conclusion of the reading of the paper, and very general approval expressed, as well as pleasure, that such an able communication should have been given to the Association by so young a man, and the hope was confidently expressed that Mr. Boyd, who has recently gone to his maiden situation as a head gardener, might soon take a place in the first rank of his profession.

Among several interesting exhibits was a fine dish of Richard Gilbert Strawberry, a promising seedling of Mr. W. CARMICHAEL'S, which excited interest. Certificates of Merit were awarded to Messrs. DICKSON & Co. for a new yellow Viola Walter Welch, and to Mr. JAMES GREENE & SONS, for Britannia Carnation, a very handsome pink-coloured border variety.

An enthusiastic vote of thanks was awarded to the President, Mr. Todd, for the successful manner in which he had planned and carried out the recent Bijou Rose show and Strawberry festival, which it is hoped may speedily grow into rivaling in brilliancy, size, and success, the great Chrysanthemum show of the Association which is second to none in Britain. Fifteen new members were proposed. D. T. F.

WELSHPOOL HORTICULTURAL.

AUGUST 4.—The above enterprising and rapidly growing society held its sixth annual show on the above date, in the park at Powis Castle, in splendid weather. Probably no position better adapted for holding a show could be found in the Kingdom than this beautifully undulating deer park.

The show was arranged in one enormous tent, or rather in a series of tents arranged *en bloc*, something of a double cruciform shape, which gave the tent manager, Mr. J. Lambert, the opportunity of displaying one of the most artistic effects hitherto seen, especially when viewed as a whole from any of the various points of vantage, evidently a step in the right direction, and one worthy of imitation by older societies. The method of arranging the exhibits involved much travelling backward and forward on the part of the judges—the only drawback that it had.

The first thing to arrest the eye was the central group, which included two rustic arches, spanning the gangways, and connecting two smaller groups around two of the tent-poles, which were draped right up to the canvas with rustic pots filled with trailing plants. In the centre of the large group were graceful plants of the now seldom seen *Humea elegans*, Kentias, and other light-foliated Palms; some grandly coloured plants of *Codiaeums*, several good plants of *Acalypha Sanderiana* mounded up on mossy banks, the undulations furnished with suitable plants of dwarfier growth, such as Begonias, Cannas, Fuschias, Ferns, Nertera depressa, &c., the whole reflecting the skilled good taste of Mr. Lambert, Lord Powis's gardener. Of course, this group was not for competition.

This group was rather damaging to the competitive groups but it afforded an example which will doubtless have its effect another year. For group occupying 200 square feet, Miss WRIGHT, Halston (gr., Mr. Roberts), was 1st, with a very pretty arrangement; Messrs. JONES & SON, Shrewsbury, were 2nd.

Cut Roses were a grand feature. Mr. MURRELL, of Shrewsbury, who staged grand boxes of Marchioness of Dufferin, Alfred Colomb, A. K. Williams, Duke of Edinburgh, and many good Teas, was awarded a Silver Medal.

Sweet Peas were excellent, Mr. ECKFORD receiving a Silver Medal.

Collection of fruit, eight kinds, Mr. H. FRANCE, Haverhurst, Wellington (gr., Mr. Bremel), was placed 1st, with Bowwood, Muscat, and Gros Maroc Grapes, Peaches, Nectarines, grand Cherries, Melons, &c.; Misses HOWELL, 2nd. A competition for Melons, Blenheim Orange leading. Peaches badly staged. Bouquets and buttonholes were very good. Bunches of annuals and wild flowers were well represented. Trade groups were well staged by Messrs. Cutbush, Dicksons, Clibran, Pattison, Murrell, Evans, and others, giving much zest to the whole. W. C.

ROYAL BOTANIC.

AUGUST 10.—The annual meeting of the Royal Botanic Society was held on Wednesday afternoon at the society's gardens in Regent's Park, Mr. C. Brinsley Marlay presiding. The Duke of Teck was re-elected president of the society.

The annual report, the adoption of which was moved by the chairman and seconded by Mr. Pembroke Stephens, stated that the year had been a successful one, the subscriptions having been greater than in any other year since 1892. The number of Fellows joining the society was 167, or 83 above the average for the last ten years, and 36 in excess of the previous year, the number now enrolled being 2,050. During the past year free tickets had been granted to 830 students, being an increase of 50 on the previous year, and about 64,000 cut specimens had been distributed for various educational purposes, showing that the medical and economic garden continued to be used and appreciated. The school of practical gardening had now been in operation nearly a year and had proved successful; several students were under instruction, and the Technical Education Board of the London County Council intended sending more. The council of the society had built during the year a substantial addition, consisting of a large dining-room, drawing room, reading-room, and library for the use of the Fellows and their guests, and a *café* for ordinary visitors, which it was hoped would be much appreciated. The report was adopted. Mr. Rubinstein, who proposed various salutary reforms, was informed that they should be duly considered by the council.

BRITISH PTERIDOLOGICAL.

THE seventh annual meeting of this Society was held recently in the Institute, Bowness-on-Windermere.

The President (Dr. STANSFIELD), in opening the proceedings, referred to the loss the Society had sustained during the year by the death of three of its members, namely, Messrs. Pease (Darlington), Tyldsley (Worsley), and Eadon (Sheffield).

He also referred to the improvement of Bolton's *Athyrium clarissima* in the hands of Mr. C. T. Drury, by the elimination of the tendency to produce coarse and imperfect fronds, and also gave a short account of his own experiments in the induction of apospory in a barren Fern, and in the attempt to perpetuate, by aposporous reproduction, Moly's variegated form of *Polystichum angulare pulcherrimum*. The Secretary's and Treasurer's reports were read, the former showing that the numbers of the Society had been maintained, and the latter showing that the funds were in a satisfactory and healthy condition.

At the election of officers, the outgoing President strongly urged that a change should be made in the holder of this office, and consequently Mr. C. T. Drury, F.L.S., was elected as the new President. Some changes were also made in the constitution of the committee. A paper was read by Mr. Atkinson, of Batley, "On Fern-growing in the Manufacturing Towns of Yorkshire and Lancashire." He recommended low houses, with cool earthen floors, and a north-western aspect, the latter being advisable in order to give a little sunshine at the close of the day. He advised a single row of hot-water pipes for the purpose of keeping out severe frost, but for no other purpose. A valuable paper was read by Mr. W. H. Phillips, of Belfast, on "Polystichum angulare proliferum, Past, Present, and Future." Mr. Phillips dealt with the history of the section, commencing from the finding of the first "proliferum" by Choulet, probably somewhere in the thirties, going on to the addition of other forms by Wollaston and others, and the gradual evolution of "proliferum" into *acutilobum*, *conspicuilobum*, *multilobum*, *divisilobum*, and finally *plumosum-divisilobum*—the details of the origin of the last most beautiful subsection, in the hands of the late Col. Jones and Mr. E. F. Fox, from spores given to the former by Mr. James Moly, and taken from his *P. decompositum splendens*, being carefully and accurately given. Mr. Phillips illustrated his paper by about a hundred well-grown fronds from his own collection of beautiful varieties, many of them having been found wild by himself, and all accurately labelled.

A paper by Mr. C. T. Drury on "Ferns as Pot Plants" was read, in the absence of the writer, by Dr. Stansfield.

Mr. Drury insisted upon the importance of Ferns being grown so as to display their full beauty as far as possible, and contrasted the appearance of Ferns to which justice had been done in this way with the miserable, half-starved, and over-crowded specimens as often seen. In order to give Ferns the best chance of displaying their charms to the fullest advantage, Mr. Drury strongly recommended that they should be kept as far as possible to single crowns, especially in the case of large and symmetrical growers, the impossibility of this in the case of caespitose Ferns, such as polypodies, &c., being fully kept in view.

An exceedingly distinct and beautiful new form of *Athyrium* was exhibited by Mr. J. EDWARDS, of Blackley, and duly named and registered as *Athyrium ramulosum* near. A number of well-grown and beautiful cut fronds were exhibited by Mr. TROUGHTON (Preston), Mr. SMITHIES (Manchester), and Mr. LOVELADY (Haslingden). A motion made by Mr. J. GOTT, of Kendal, that new Ferns, named and registered by the society, should in future be figured, and prints issued to the members, gave rise to considerable discussion. The idea was generally approved in principle, and it was ultimately resolved that the committee be instructed to make inquiries as to the best methods of illustration, and to submit specimens of various processes to the next meeting.

THE MIDLAND CARNATION AND PICOTEE.

AUGUST 5, 6.—It was generally acknowledged that the exhibition of Carnations and Picotees at the Botanical Gardens, Edgbaston, Birmingham, on the above date, was the finest, taken all round, which has been held at that town. There was not only a large number of blooms staged, but the quality was good in all. And yet there was scarcely a cultivator exhibiting who resided north of Wolverhampton. The northern growers say their blooms are very late, and it is doubtful if many of them will be open fully by the 13th, the date of the northern exhibition.

Mr. MARTIN R. SMITH, who was present, and Mr. J. DOUGLAS brought very fine blooms from the south, and carried off some of the leading honours of the day. As at the Crystal Palace, the smaller classes were largely filled, especially from the Birmingham district, where there are now a large number of Carnation growers.

In the show-house of the Edgbaston Botanical Gardens the flowers are seen to the better advantage than at the Crystal Palace, where the size of the building dwarfs them so inordinately, and the leafy backgrounds at the former place throws up the tints of the flowers. The show capacities of the building were tested to the utmost on this occasion, in view of several excellent honorary exhibits.

The bizarre and flaked Carnations were much superior to those shown at the Crystal Palace, and the selfs, yellow-grounds, and fancies were superb blooms. The flowers competing in the single classes were very numerous, forming of themselves an exhibition, and much superior as a whole to what is generally seen competing in this group of classes.

Self Carnations.—By way of affording some variety, the brilliant selfs had the place of honour in the schedule. There were ten stands of twelve blooms, Mr. C. BLICK, gr. to Mr. M. R. SMITH, The Warren, Hayes, Kent, took the 1st prize with blooms of great beauty and refinement. Of yellow selfs he had Cecilia and Gad-about, Midas, orange-Benbow, salmon; The Naiad, Helmsman, Ensign, and Purity, white; Joan of Arc and Conqueror, rose; Etna, scarlet; and Comet, crimson. Mr. R. SYDENHAM, Birmingham, was a close 2nd, having Germania and Regina, yellow; Little John, scarlet; Uncle Tom, very dark; Mrs. E. Hambro, white; Sea Gull, blush; Mrs. Colby Sharpin, apricot, as his leading flowers.

Some idea of the keen competition in the class for six selfs can be gained when it is said there were seventeen entries, Mr. A. W. JONES, Handsworth, Birmingham, taking the 1st prize with superb examples of Exile, rose; Mrs. Eric Hambro, white; Sea Gull, blush; Miss A. Campbell, yellow; Mrs. C. Sharpin, apricot; and Mancunian, dark maroon, very smooth and fine. Mr. R. C. CARTWRIGHT, Selly Oak, Birmingham, a very successful representative of the younger generation of Carnation specialists, was 2nd, with Mrs. Eric Hambro; Her Grace, blush; Exile, Regina, Sea Swallow, flesh colour; and Ruby, clear ruby.

Yellow Ground Picotees.—In this case yellow grounds are indispensable, but there must be one colour only on the petals, though it may be in fine lines or flakes as well as on the edge. One could, however, wish to see less laxity than was shown in some of the blooms staged. Seven stands put in an appearance in the class for twelve blooms, Mr. BLICK again securing the 1st prize, with a splendid lot of flowers, which comprised Gad-about, in this case having a distinct Picotee edge, Hesperus, Lady Bristol, Badminton, Professor, Empress Eugenie, Aglaia, Hygeia, Mrs. Jordan, Busybody, Gazelle, and Voltaire; Mr. JAS. DOUGLAS was 2nd, he having in very fine character, Heather Bell, Dervish, Voltaire, Mohican, Wanderer, His Excellency, and Mr. Nigel.

There were sixteen competitors in the six bloom class, Mr. R. C. CARTWRIGHT being 1st with the following, in grand character, Golden Eagle, Mr. Nigel, Countess of Jersey, Eldorado, Voltaire, and May Queen; and Mr. A. R. BROWN, Handsworth, Birmingham, was 2nd, having admirable blooms of The Gift, May Queen, Voltaire, Golden Eagle, Mr. Nigel, and Eldorado. Then there was a class for six Fancy Carnations, from which yellow-ground Picotees are excluded,

and here Mr. C. BLICK came again to the fore, with excellent examples of Morcar, Queen Bess, Alexandra, Goldilocks, Perseus, and Hidalgo, a really splendid lot; and Mr. R. SYDENHAM came 2nd with Monarch, George Cruickshank, Phoebe, Little Sam, The Czar, and Perseus.

White-ground Picotees.—There were six entries of twelve varieties, Mr. R. SYDENHAM having first-rate blooms of high quality, including the varieties H. Red E. Ganymede, H. P. E. Mrs. Openshaw, Muriel, and Miriam; L. P. E. Ann Lord and Jessie; H. R. E. Lady Louisa and Little Phil; L. R. E. Fortrose. H. Scarlet E. Mrs. Sharp; L. Scarlet E. Favourite and Dolly Dimple; and taking the 1st prize. Mr. A. R. BROWN was 2nd, he having as his leading blooms, H. Red E. Brunette, H. R. E. Mrs. A. B. Brown, a very promising new variety; H. Red E. Ganymede, L. P. E. Harry Kenyon, &c.

Nineteen entries were made in the class for six blooms. Mr. A. W. JONES, who had a great local reputation as a successful cultivator, was 1st, with excellent blooms of L. Red E. Thomas William, H. P. E. Amy Robsart and Mrs. Openshaw, H. Ro. E. Mrs. Payne, Mrs. A. R. Brown, and Little Phil; and Mr. R. C. CARTWRIGHT was 2nd. He had Ganymede, Amy Robsart, Little Phil, Mrs. Sharp, also L. P. E. Pride of Leyton, and Mrs. Payne.

White Ground Carnations.—Eight competitors staged in the class for twelve flaked and bizarre Carnations, Mr. R. SYDENHAM adding to his honours by taking the 1st prize with refined blooms of S. Bs. R. Monk and Edward Adams; C. Bs. Mrs. J. Burgess, J. S. Hedderly, and Master Fred; P. P. B. Sarah Payne; P. F. Geo. Melville and Gordon Lewis; S. F. John Wormald and Sportsman; R. F. Mrs. Rowan and Thalia; and Messrs. THOMSON & Co. were 2nd, their best blooms being S. F. Sportsman; S. B. Robert Houlgrave; R. F. Mrs. Moy, Thalia, and Cristi-galli; C. B. J. D. Hextall and Master Fred, and P. F. Gornon Lewis.

With six white-ground Carnations, Mr. C. F. THURSTAN was 1st, having S. B. Edward Adams, C. B. J. S. Hedderly, P. P. B. Arline, P. F. Geo. Melville, S. F. Sportsman, and R. F. Mrs. Moy.

There was a class for six Carnations of any type, exhibited by maiden growers who had not taken a 1st or 2nd prize at any exhibition of the Society. Mr. T. F. DRANFIELD was 1st, staging all of the fancy type, he having Monarch, May Queen, Voltaire, and Eldorado, with two seedlings; Mr. W. H. TWIST, Birmingham, was 2nd, he having all white-ground Picotees.

Undressed Blooms in Vases.—Several prizes in various classes were offered for these, the flowers to be as little dressed as possible, whatever that quantity of artificial manipulation might be. Mr. R. SYDENHAM had the best twelve selfs, set up with Carnation foliage; and Mr. M. R. SMITH was 2nd. There were many entries for six selfs, Mrs. W. BELLAMY was 1st. Mr. BLICK staged the best twelve fancies or yellow grounds in the same way; Mr. J. DOUGLAS being 2nd. Out of seventeen entries Mr. R. CARTWRIGHT was 1st, with six yellow grounds or fancies. Mr. R. SYDENHAM had the best twelve white ground Picotees; Mr. A. R. BROWN was 2nd. With six white grounds, Mr. THURSTAN was 1st.

The class for six blooms of any type brought a keen competition also, and here again Mr. CARTWRIGHT came 1st, Messrs. THOMSON & Co. being 2nd. As a general rule the flowers in the foregoing classes were unnamed.

Carnations.—In the classes for single blooms the following were the best, S. Bs.: 1st, Admiral Curzon; Robert Houlgrave being 2nd, 3rd, 4th, and 5th. C. Bs.: 1st, 3rd, and 5th, Master Fred; 2nd and 4th, J. S. Hedderly. P. P. Bs.: 1st and 2nd, William Skirving; 3rd, Sarah Payne; 4th, Geo. Rudd; 5th, Cooper. S. F.: Sportsman was in such good character that it took all five prizes. R. F.: 1st and 4th, Thalia; 2nd and 3rd, Merton; 5th, Mrs. Moy. P. F.: 1st, 2nd, 4th, and 5th, Gordon Lewis; 3rd, Geo. Melville.

PICOTEES.—H. Red E.: 1st, 2nd, 3rd, and 5th, Ganymede; 4th, Brunette. L. Red E.: 1st, 2nd, and 5th, Thomas William; 3rd and 4th, Mrs. Gorton. H. P. E.: 1st and 4th, Muriel; 2nd, 3rd, and 5th, Mrs. Openshaw. L. P. E.: 1st, Harry Kenyon; 2nd and 3rd, Ann Lord; 4th and 5th, Pride of Leyton. H. Rose E.: 1st, 2nd, and 5th, Clio; 3rd and 4th, Mrs. Sharp. H. Scarlet E.: 1st, and 2nd, Mrs. Payne; 3rd, Little Phil; 4th and 5th, Lady Louisa. L. Ro. or Scarlet E.: 1st, 3rd, and 5th, Favourite; 2nd, Fortrose; and 4th, Mrs. Payne.

Selfs and Fancies.—White or flesh: Mrs. Eric Hambro, white, took all the prizes. Yellow, buff, or terra-cotta: 1st, Benbow, apricot; 2nd, 3rd, and 5th, Regina, yellow; 4th, Cecilia. Rose, pink, or salmon: 1st and 2nd, Exile, rose; 3rd, Royalty, rose; 4th, Ada, salmon; 5th, Felicity, pink. Scarlet: 1st, Etna; 2nd, Mrs. Parkinson; 3rd and 5th, Seedlings; 4th, Grandeur. Dark: 1st, Uncle Tom; 2nd, Sir Bevy; 3rd and 4th, Mancunian; 5th, Negress. Wire-edge: Y. G. Picotee, 1st, Mrs. Douglas; 2nd, Seraph; 3rd and 4th, Mohican; 5th, Ladas. Heavy-edge: Y. C. Picotee, 1st and 2nd, Voltaire; 3rd and 5th, Wanderer; 4th, Eldorado. Fancy Carnations: 1st, Lady Ardilaun; 2nd, Cardinal Wolsey; 3rd and 4th, Monarch; 5th, Ossian.

Premier Flowers.—Bizarre: Master Fred, C.B., a very finely-marked bloom, from Messrs. THOMSON & Co. Flake: Gordon Lewis; P. F., Mr. R. Sydenham; R. E. Picotee, Mrs. Payne; Ro. E., Thomas William, L. Red, both shown by Mr. A. W. JONES; Y. G. Picotee: Hygeia, Mr. Martin R. Smith; Self: Benbow; Apricot: Mr. M. R. Smith; Fancy Carnation: Queen Bess, Mr. M. R. Smith. No Certificates of Merit were awarded, though some seedlings were staged.

Border Carnations cut with long stems as grown did not bring a great deal of competition. Mr. BLICK, who was the only exhibitor, had the best twelve bunches of border

varieties, and the best twelve yellow grounds or fancies, with remarkably good blooms. Mr. T. W. WEGUELIN, Teignmouth, carried off the 1st prizes for six bunches of each; Mr. A. J. ROWBERRY, South Woodford, was 2nd.

Plants in Pots.—The best six pots of Carnations came from Messrs. THOMSON & Co., who had yellow grounds, Mr. R. SYDENHAM winning 2nd, mainly with selfs; but the plants were well grown and bloomed. Mr. Ernest Benary's (Erfurt) special prizes for varieties in pots of his own raising, brought no competition. Floral decorations consisted of bouquets, sprays, and tables. Capt. SHAWLES had the best bouquet, consisting wholly of a pale salmon variety, with appropriate foliage. Mr. BLICK came 2nd, with an imposing posy of mixed varieties. Sprays and button-holes were both numerous and good. The best table was arranged by Miss MONK, delicate white and yellow self Carnations being employed with good effect; Mrs. LOVATT was 2nd, with a rather florid arrangement.

The Sydenham Amateur Challenge Cup was taken by Mr. M. R. SMITH, the Midland Counties Challenge Cup by Messrs. THOMSON & Co., and the Birmingham Botanical Society's Silver and Bronze Medals went to Messrs. SYDENHAM and THOMSON & Co.

Some special prizes were offered for other exhibits. Mr. Henry Eckford, Wem, invited twelve bunches of Sweet Peas, and an excellent competition ensued; and the same occurred in the case of Mr. R. Sydenham's special prizes for nine bunches. These two classes brought a charming display. Epergnes of Sweet Peas were also invited, and several very pretty ones were set up. There was also a class for twelve bunches of herbaceous or perennial blooms, but only two collections of moderate merit were staged.

Miscellaneous.—Mr. B. R. DAVIS, Yeovil, set up a splendid bank of double and single Begonias, and was awarded a Silver-gilt Medal. Silver Medals were awarded to Mr. H. ECKFORD for one of his unique collections of bunches of Sweet Peas; to Mr. W. F. GUNN for a very fine collection of hardy cut flowers; and to Messrs. HEWITT & Co., Solihull, for the same and attractive floral decorations. Mr. J. H. WHITE, Worcester, had hardy flowers; Mr. J. DOUGLAS, cut Carnations; and Mr. R. SYDENHAM floral decorations.

In the evening Mr. R. Sydenham entertained the judges, exhibitors, and others at supper on the show ground, when several practical suggestions were thrown out with a view to the improvement of the schedule of prizes.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 6, is furnished from the Meteorological Office:—

"The weather was unsettled and rainy in the extreme north and north-west from the commencement of the period

and these conditions gradually extended southwards and eastwards, so that towards the end of the week they embraced the entire kingdom. Thunder and lightning were occasionally experienced, chiefly in the eastern and south-eastern parts of Great Britain.

"The temperature differed very little from the mean value over Great Britain, but was slightly above it in Ireland. The highest of the maxima were recorded during the earlier days of the week, and ranged from 80° in 'England, E.' and 79° in the 'Midland Counties' and 'England, S.' to 71° in 'Ireland, N.' and 68° in 'Scotland, W.' The lowest of the minima, which were registered on July 31 over England and Ireland, and towards the end of the period in Scotland, ranged from 34° in 'England, S.W.' and from 40° in 'Scotland, E.', 'England, E.', and the 'Midland Counties,' to 45° in 'Scotland, N.', 'Ireland, N.', and 'England, N.E.' and to 49° in the 'Channel Islands.'

"The rainfall was less than the mean in 'Scotland, E.' and 'England, E. and S.' and just equal to it in the 'Channel Islands;' elsewhere, however, there was an excess, that over Scotland and the greater part of England being very large. The fall exceeded an inch at several of the inland English stations on Wednesday, and at others on Saturday. On the latter day, at Stamford, about 1.25 inches is reported to have fallen between 4 and 7 P.M.

"The bright sunshine was less than the normal over all the western and most of the northern parts of the kingdom, but exceeded it over southern, central, and eastern England, and in the 'Channel Islands.' The percentage of the possible duration ranged from 62 in the 'Channel Islands,' 54 in 'England, S.', and 50 in 'England, E.' to 38 in the 'Midland Counties,' 19 in 'Ireland, S.', 18 in 'Scotland, W.', and 14 in 'Ireland, N.'"

MARKETS.

COVENT GARDEN, AUGUST 11.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Large supplies of foreign Greengages and Plums coming in good condition and of good size. The Orleans Plums are fine, whereas our home-grown that I have seen were small. There are also Apples in cases, Grapes in tubs, and Plums in various packages coming daily. Of cooking Apples the best, I think, are Suffields, as they are the largest. Strawberries are now practically over. If any reader wants Walnuts to pickle secure them immediately, if they are not already wooded. If they are not do not have them at any price, as they will be a failure. Gooseberries have been low in price all the season, and are finishing badly.

SEEDS.

LONDON: August 10.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a continuance of quiet and ill-attended markets, with but few transactions passing. The rise in new French and English Trifolium is maintained, and the demand is only moderate. There is a steady sowing inquiry for Rape and Mustard at recent figures. Samples of new Essex Rye are now showing. Canary seed tends upwards. Linseed quiet. Blue Peas and Haricot Beans neglected. Other articles at this dull period offer no subject for comment.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending August 6, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.
s. d.	s. d.	s. d.	s. d.
Wheat ...	29 5	35 7	+ 6 2
Barley ...	17 9	26 11	+ 9 2
Oats ...	18 11	20 7	+ 1 8

(Remainder of Markets carried forward to p. ix.)

ALGÆ: P. R. Dellesteria sanguinea "Dulse."

BEEBLE FOUND ON ROSE BUSHES: Isaac Milsom. The beetle is one of the few Rose-beetles found in this country, and is called Cetonina aurata. The perfect beetles are often found upon Roses, and they sometimes alight on Strawberry-plants, devouring the pistils and stamens of the flowers. The grubs are not satisfied with a light diet of Rose-petals and leaves, &c., but subsist mainly on decaying-wood found at the root of trees, and are frequently found in ants' nests, where they remain undisturbed by the ants.

CLOVER PARASITE: P. L. H. Orobanche minor—Broomrape. Your men must have been very unobservant, for it is very common, but not generally so abundant as you say. It is parasitic on the

roots of Clover, and was probably introduced with the Clover seed.

DONATION.—The Editor begs to thank Mr. Parker, Pitchcombe View, Stroud, Gloucestershire, for his donation to the Royal Gardeners' Orphan Fund of the sum of 10s. 6d., which has been forwarded to the Treasurer, Mr. A. F. Barron, 13, Sutton Court Road, Chiswick.

GOAT MOTHS: W. H. B. If the moths are numerous and the grubs are doing much injury to the stems of trees by boring into them, the former should be caught, as they rest quietly during the day on the bark of the trees, out of which they are hatched. A coating of clay and cow-dung, laid on the bark, has been found to deter the moth from laying her eggs on a tree. The grubs may be killed in the galleries they make by inserting a piece of stiff wire; and tobacco-water, petroleum, fumes of the flowers-of-sulphur, forced into their holes, will kill them. If a tree is much infested it should be cut down, and the grubs destroyed.

NAMES OF FRUITS: A. A., Glasgow. A, Industry (Whinham's); B, Legerdemain; C, do.; D, Broom-girl; E, Companion (Hopley's). If sending others, kindly send some foliage.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. C. 1, Veratrum nigrum; 2, Gnaphalium margaritaceum; 3, Clematis flammula; 4, Achillea Clavennæ; 5, Tecoma jasminoides. Thank you very much for sending good specimens, properly packed and labelled.—J. M. B. Spiraea Lindleyana.—E. S. R. 1, Fuchsia splendens; 2, Cestrum aurantiacum; 3, Berberis nepalensis; 4, Phalaris arundinacea variegata; 5, Euonymus japonicus aureo-variegatus; 6, Euonymus japonicus albo-variegatus.—P. L. H. Cattleya Eldorado.—G. B. 1, Hæmanthus natalensis; 2, Helianthus doronocoides, perhaps; 3, Agrostemma coronaria; 4, Enothera Youngi; 5, Sedum pruinosum; 6, Lysimachia nemorum; 7, Blechnum vulgare; 8, Adiantum Waltoni diffusum.—J. McM. The Rose is a variety of Rosa microphylla. No. 1, Spartium junceum, Spanish Broom; 2, Genista tinctoria.—J. P. Campanula rapunculoides, Enothera biennis. The rust on C. rotundifolia is Coleosporium campanulæ. We fear there is nothing to be done but burn the affected plants. We cannot tell you about the Iris at present; wait till the holiday season is over and send other specimens.—H. R. G. 1, Teucrium scorodonia; 2, Stachys sylvatica; 3, Geranium Robertianum; 4, Melilotus officinalis; 5, Scrophularia aquatica; 6, Lychnis dioica; 7, Linaria cymbalaria.—Anxious One. Spiraea Lindleyana.—Acelistansen (?) Edmonton. Hoya carnosa.

PALM: L. S. You can stave off the time when it will have got so large that you must dispose of it by making a brick enclosure, round or quadrangular, the bottom of which will be lower than the base of the roots by 2 to 3 feet, and then plant the Palm therein.

POTATOS: Austin & McAslan. The material and information sent are insufficient to enable us to form an opinion as to the cause of the malady.

WATER-WEED: H. Potamogeton natans. Can you run the water off, and dry up the bottom, removing all the plants as far as possible?

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is reserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 20, 1898.

THE PRINCIPLES AND PRACTICE OF PRUNING.

THERE are many ways in which the gardener may avail himself of Nature's workmanship, and one of these consists in the production of a great variety of luscious fruit from trees which, in the wild state, bear fruit of a single uniform type, sour, insipid, and unfit for the human palate.

From the Crab he has obtained the nutritive Apple; from the wild Pear all the juicy varieties of that fruit; from the wild Gooseberry, scarce larger than a bullet, the swollen, sweet-tasting berries of our kitchen-garden, an inch across; and so on with very numerous other kinds.

How has this feat, far-reaching indeed in its beneficent results, been brought about? By dint of careful and patient cultivation through centuries, if not millennia of years, of the rough-hewn products of Nature dispersed around us in the world.

Almost all horticulturists agree that pruning should play a part in the cultivation of our fruit-trees, for its usefulness has been established over and over again.

The practice of pruning is founded on the fundamental biological fact that in the growth and life-history of every plant there are two forces at work—the force which tends to the production of vegetative, and that which tends to the formation of reproductive organs.

In Nature an even balance between these two forces is almost always ultimately struck, the one ever subserving the other, neither being in any way exaggerated or hurried, the ultimate result being that condition which is, to all intents and purposes, most perfectly adapted to the plant's immediate environment, and hence to the needs of its adequate and full existence.

As attractive-looking, sweet-tasting fruit is always produced by a plant in order that animals of some kind or other may pluck it, devour it, and so help towards the dispersal of the seeds which it contains, this result being finally attained, the plant has realised the aim of its existence. The Crab-tree and the wild Gooseberry-bush have reached the point of sufficiency for the needs of their life in the production of the fruit which the wild birds probably fully enjoy.

But civilised man, appearing on the scene, will have something still better than this; and in order to attain his end, he, alongside of other and equally important modes of cultivation, such as planting in properly-treated soil, cross-breeding, assignment of a spacious position, and protection from insect-pests, sets to work to upset the equilibrium established by Nature between the two forces above-mentioned, thus creating a disturbing and restraining influence upon the free course of the tree's life. For he recognises the principle that, by restraining the force which tends to the forma-

tion of vegetative organs, he can increase that which tends to the formation of reproductive organs. This artificial interference on man's part with the ordinary life-conditions of the tree must lessen the vigour and shorten the life of the latter to a certain extent; but we shall see that the advantage accruing to man from his action far outweighs any loss of robustness or shorter duration of fruit-bearing activity which the tree may suffer therefrom. Hereafter, the cultivated Apple-tree of the orchard will lack the strong vigour of the wild Crab-tree of the forest; but the latter, if it could do so, would marvel at the wonderful change in the character of the fruit produced by its descendant. Man, by the swift process of artificial selection, has followed in the wake of the slower process of natural selection, and the result is unique.

We have now to consider some of the more detailed methods by which the force which tends to the formation of vegetative organs is diverted, and that which tends to the formation of reproductive organs, viz., the fruit allowed freer play.

It is but natural that the orchard fruit-tree, if left to itself, as regards the knife, will form vegetative growths, and fruit pretty much after the same fashion as the wild Crab-tree. There may be some difference in quality of the fruit, owing to the richer soil and more favourable situation and precedent ancestry, but this difference will be but slight and inappreciable. Something else will have to be done in order to induce the predominance of fruit-formation to that of vegetative growth. And this is pruning.

This important factor must come into play in the very first infancy of the tree, as it gradually develops and grows from the grafted or budded scion. The pruning at this stage of its life-history will depend on the mode of training to which the tree is hereafter to be subjected. If the future fruit-bearer is to be a wall or espalier-tree, the growth of the main stem or leader must be subordinated and more or less sacrificed to the growth and development of the lateral branches; for, if Nature were allowed free play, the main stem of the tree would soon overtop the wall and the lateral branches become subordinate and of comparatively insignificant length. But the object which the gardener has in view in the training of these trees is that the wall or espalier shall be well covered by the tree, and the space available thoroughly economised, so that the tree must henceforth, from its youngest state onwards, pursue a horizontal rather than a vertical direction of growth. It will thus be seen that the tree departs from its natural habit of growth, not only by this horizontal development of the lateral branches at the expense of the main stem or leader, but also in the fact that the lateral branches are allowed to develop in one plane only, viz., that of the long extension of the wall or espalier. Few forms could be more unnatural or more utterly unlike the habit of the tree in its native state; and the fact that the tree will submit to this and other almost equally artificial methods of training, and bear good fruit, argues that fruit trees have been under training and cultivation for untold generations, and have thus become gradually inured to such severe treatment.

The young grafted tree, at an early age, is topped, or shortened, for several inches, which interruption in the normal flow of the sap upwards causes the latter to accumulate in greater abundance at the place of insertion of the uppermost lateral eyes or buds, and from these to induce the precocious development of lateral branches, while a new leader is allowed to develop from the highest bud or not, as the case may be. Supposing the leader to grow upward rapidly again after this treatment, it must the following winter be again topped in order to start a second pair of laterals above the first formed, and so on year after year, the pruning always being performed in the winter-time, when the active life of the plant is

suspended, and when, therefore, there is less fear of interfering with its vitality and its proper course of growth.

The lateral branches are not to be shortened at all in the case of most hardy fruit trees with vigorous growth, but are to be allowed to grow right ahead as far as space will permit. If shortening took place, the sap, instead of being evenly and equally distributed throughout the whole length and thickness of the branch, would be thwarted in its natural course, and induced to accumulate to excess in the lateral buds or eyes, especially those near the end of the pruned branch, and these eyes being caused to shoot, the result would be, instead of the fruit-spurs which would naturally have appeared all along the untouched branch, a great production of tertiary woody shoots, and a consequent absence or great reduction of fruit-forming twigs. The topping of any leading shoot inevitably induces the formation of lateral members—a wise provision of Nature for the continuance of the temporarily thwarted vegetative growth of the shoot, but which is exceedingly detrimental to all immediate fruit-forming capacity, and thus to be avoided by the cultivator. Certain kinds of trees, however, such as the Peach, Nectarine, Apricot, which are less vigorous and active in their growth, owing perhaps to the fact that they hail from under more southern skies, are not nearly so liable to the formation of woody outgrowths when their lateral shoots are shortened; hence, where found advantageous, this practice may with these more frequently be indulged in.

If it is desired to form a "pyramid," the same process of topping of the young budded tree must be practised, and a number of branches induced to develop all round the stem, which must be kept at even distances apart, and proportionate in length, so that the lowest are always the longest and strongest, otherwise the pyramidal form will not be retained. To obtain this result, the lateral branches will require carefully watching and training, and frequent shortening to the proportionate distances, otherwise they will naturally tend to grow irregularly in length and in direction.

In the formation of standards by pruning, the main object is to obtain a well-formed symmetrical head or crown. After the young tree has reached a certain height, its natural growth is severely interrupted and suppressed, owing to the fact that henceforth a number of spirally-arranged lateral branches are caused to develop from the uppermost eyes, entirely at the expense, and to the ultimate complete extinction of, any further growth in length of the main mother-stem. The latter is first of all topped, in order to induce the out-growth of the lateral shoots, but not in the manner described for the "pyramid," close above an eye, but some little distance above, so as to leave a blind stump. By this means the topmost eye of the mother-stem will be caused to grow in an obliquely ascending direction upward, as an uppermost lateral shoot, instead of forming a vertical continuation of the main axis, as it would do if no stump were left. The second service performed by the stump is to draw for a time some of the sap away from the topmost eye, and so prevent it developing too vigorously and more strongly than the others. Eventually the stump must be removed. This same kind of topping must be adopted, with all the lateral and every succeeding shoot in the same way, until, after the tree has for a few years been put through its youthful training, it is eventually left entirely to itself.

These are the three principal types of the artificial form to which fruit-trees are trained in the garden. As we have seen, the desired form must be early induced in the young tree, when its tissues are as yet plastic and yielding, for it goes without saying that it is difficult to force an older tree, especially when it has begun to form fruit, into a habit of growth to which it is entirely unaccustomed.

One main object of the training of fruit-trees into various shapes is, of course, to please the eye; it is elegance or strangeness of form which we desire to see; but the chief object of the cultivation of fruit-trees is the production of fruit. We have no wish to see an abundance of fine fruit developed on an uncomely

tree; but neither do we wish to see a beautifully-formed tree with a paucity of fruit. The ideal towards which we have to strive is a mingling of the two characters: the abundant production of fine fruit and an elegance of form in the tree. And the elegance of form of the tree (at least, in its younger state), and the quality, if not the quantity of the fruit which it bears, must be superior to what we find in Nature. W. C. Worsdell, F.L.S.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

STANHOPEA MADOUXIANA, *Cogniaux ex F. Claes*, in litt. (1896).*

[See Fig. 34, p. 135.]

I RECEIVED from M. Florent Claes materials which enabled me to study this new species at the same time and in the same way as was the case with *S. Rodigasiana*. (See *Gardeners' Chronicle* for July 9, 1898, pp. 31 and 32.) The pseudo-bulbs are ovoid, covered with scales, which at the point are all fringed into narrow filaments; they are surmounted by a leaf which is erect, full, rather stout, oblong, sharply-pointed, with five distinct veins, of a deep green colour, attaining from 20 to 30 inches in length by from 5 to 9 inches across, furnished with a long and slender petiole. Peduncle pendent, long, rather robust, flexible, biflorous or sometimes uniflorous. Bracts rather large, swelled, oval, obtuse. Flowers deliciously fragrant, from 5 to 7 inches across, lasting about three days. Sepals triangular-oval, obtuse, convex, of a cream-white colour, evenly covered with large spots of carmine-rose much raised towards the peduncle after the second day from the opening of the bloom. Petals widely oblong, obtuse, convex, with very delicately waved edges, a little shorter than the sepals, of the same colour as they, and raised like them towards the peduncle. Lip fleshy, nearly as long as the sepals, of the same colour as the other parts of the flower, except the cavity of the hypochile, which is deeply tinged with violet-black; hypochile long, cymbiform, much incurved, and a little dilated in the upper part, without appendices; mesochile bearing two fleshy horns, pendent, ligulous, pointed, slightly arched; epichile the size of the horns, oval, pointed a little, convex. Column as long as the lip, rather incurved, nearly semi-cylindrical in the lower portion with two rather large wings in the upper part. This beautiful species, which seems somewhat to resemble *S. oculata*, Ldl., was obtained by M. Claes in the Province of Antioquia (Columbia). *A. Cogniaux*.

CULTIVATION OF CACTI AND OTHER SUCCULENTS.

ACCORDING to M. Delaet, the cultivation of Cacti is easy, and does not even necessitate heat, as all can be grown indoors, and in summer in the open ground.

The best compost for them consists of one-half of good substantial mould, a quarter of light peat, and one quarter portion of wood ashes; the whole to be mixed with the coarsest sand and broken lime (mortar-rubbish from old walls) very thoroughly. Cacti do well in this soil; Phyllocacti require rather more peat and less lime.

Rhipsalides are cultivated successfully in the same compost as many Cypripediums; that is, fibrous peat and sphagnum moss, well chopped and mixed.

In winter the Cacti are watered as little as pos-

sible, and only when kept in a room where the air is dry and warm, or cold and dry, do they need more or less water. If in a greenhouse, but little water is necessary, as the dampness there yields sufficient by evaporation. It is better to water the paths even rather than the plants themselves. Pilocereus needs no water in winter; Phyllocacti require rather more, and Rhipsalides a larger amount still.

As summer advances, the quantity of water given should be increased, and in great heat may be poured over the plants through a rose.

Seedlings require rather more moisture, especially in summer. In winter a temperature of 4° to 6° C. is sufficient; in summer it may be very high if air is admitted, the ventilators being open even at night. B.

ORCHID NOTES AND GLEANINGS.

CATTLEYA GRANULOSA.

FROM Mr. Cobb, of Dulcote, Tunbridge Wells, we have received a specimen of this Orchid, with two lateral sepals, two lip-like petals crossing the sepals at right angles, with an erect flattened column, with imperfect anther on the top. The lateral petals and the ovary were entirely absent. The flower thus shows a tendency to diminution in the number of parts, such as is so very common in this order, and a tendency to increased irregularity by the formation of a second lip.

AERIDES LEDOUXIANUM (PROVISIONALLY NAMED).

A most extraordinary specimen of an *Aerides* with a remarkable history has just flowered in the collection of R. le Doux, Esq., West Derby, who showed it at the Liverpool Exchange News Room on Wednesday, August 10, when it created quite a sensation, not only among those who know Orchids, but the general public. On the following day it was shown at the rooms of the Manchester Orchid Society, where it secured a Silver Medal. The plant, which is a noble specimen of the *A. odoratum* type, bore between fifty and sixty splendid flower-spikes, the whole forming, perhaps, the best specimen of an *Aerides* ever seen. Its history is somewhat curious, for the exact locality from which it was collected cannot be decided by what is known of it, though we may be tolerably sure it was not Brazil.

During the lifetime of the late Mr. E. S. Rand, of Para, Brazil, he made an arrangement with Mr. John Cowan, of Gateacre Nurseries, Liverpool, that on his death the collection should be brought to this country and sold on account of his executors. Thus, when informed of his death, Mr. Cowan, Jun., proceeded to Para, and carefully packed and brought home the plants. The *Aerides* now under notice was established on a tree in Mr. Rand's garden at Para, and it measured 5 feet to 6 feet in length, by 3 feet across. When first placed on the tree it was a very small plant, and although it grew so freely it had never flowered until it received the check of removal (on the branch on which it was growing), the journey to Liverpool, and the change into Mr. Le Doux collection, where it is still displaying its wealth of fragrant flowers. Such an event speaks well of the enterprise of Mr. John Cowan and of his son, and it is highly satisfactory to the new owner of the plant, who prizes it highly.

POTATO DISEASES.

MR. E. ROZE thus sums up an important paper on the diseases of the Potato, contributed by him to the *Bulletin of the Mycological Society of France*:—

"1. DRY GANGRENE produced, 1st, by *Pseudocommis Vitis*, Debray.—Tubers free from smell remaining firm, and showing depressed, dark spots or perforations, surrounded, in the parenchyma, with a brownish band. Under the spotted epidermis, in the unsoftened parenchyma, are spots more or less brown or reddish, which are evident now here and now there with a clearer tint in all the tissue.

These tubers can be kept just so until spring, the season when they develop shoots, which bear brownish

or blackened spots at the tip. Planted, they give rise to the "Frisolée" disease. This alteration is often associated with the following changes.

Dry gangrene is also produced by micrococci only. In this case the tubers are free from smell, moderately firm, more or less spotted, but manifesting in certain places a loose epidermis, which does not resist the pressure of the fingers. Under this epidermis and in the parenchyma, white, grey, or brownish blotches, showing when the tubers are dry, brilliant and powdery starch grains.

Sometimes there are depressions, or even, in the greyish surfaces, small black masses (sclerotes of *Rhizoctonium*), and, later on, an abundant development of *Mucedinæ* (*Fusisporium* and *Spicaria*). The tubers, completely altered and dried up, become sometimes very light; at others they harden and get fragile. But in consequence of constant humidity, in partially attacked tubers, the micrococci continue to develop, and their mucus escapes even through the epidermis. This it is which renders contact in cellars of diseased and healthy tubers so dangerous.

2. WET GANGRENE, produced, 1st, by micrococci allied to *Bacillus subtilis*, Cohn.* Tubers partially or wholly soft, exhaling a disagreeable odour. Under the epidermis, whitish liquefaction of the parenchyma, with disengagement of butyric acid. Destruction slow and progressive, then complete in the tubers owing to the greater or less moisture of the situation. Contact with healthy varieties to be avoided.

Also by *Phytophthora infestans*, Bary. Tubers free from smell [?], showing a partial or complete damp softening. Epidermis shrunken, sinking on to the parenchyma, which is weakened, depressed, pasty, but not deliquescent. This parenchyma remains thus pasty, without wholly drying up.

If, now, I tried to establish a proportion between these four different methods of alteration in Potatoes, I should estimate at not fewer than 50 per cent. the number of tubers attacked by micrococci, and at about 25 per cent. the number of those affected by *Pseudocommis*. I am greatly disposed to believe, contrary to the general opinion, that the smallest proportion of tubers is infested by *Phytophthora*, which penetrates the tubers much less frequently than formerly, but which now continues no less to attack the stems and leaves of our Potatoes when these are not protected against it by treatment with salts of copper.

The remedies to be recommended to diminish as much as possible the effects of the different causes of change in the tubers may be summed up thus:—Alternation of crops, planting healthy tubers, destruction at harvest of all diseased Potatoes, and treatment of Potato-stems with copper solutions."

A DRUGGIST'S GARDEN.

ABOUT twelve months ago did the Manor House, Wallington, pass into the hands of Mr. Thos. Christy, who is exceedingly busy in an endeavour to bring it and the gardens into good condition. The Manor House and grounds occupy nearly 20 acres, and the land is situated between two roads, one of which leads to Hackbridge, the other to Croydon. The residence is a famous house, and parts of it are very old. Almost underneath the drawing-room even is an old Norman chapel, and quaint steps leading thereto. It is said that the first Italian roof put upon a residence in this country was that used in the case of the Manor House. There is evidence that at one time the gardens were the subject of intelligent interest, as, for instance, in the selection of the trees and shrubs, which, according to report, was the work of an Italian. Everything has since been neglected. The trees have overgrown each other, the fine, extra large, variegated Hollies

* Tubers plunged in water for two or three days, at a temperature of about 25°, show that they are infested with *Bacillus Amylobacter*. This bacillus must then attack the tubers of Potatoes growing in a too moist soil during the summer. But I have not met with it in crops of early varieties. As to tubers of late varieties, previously attacked by this bacillus, they are found completely destroyed when taken up in autumn.

* *Stanhopea Madouxiana*, *Cogniaux ex litt. F. Claes*.—Pseudobulbo ovoideo, squamis vetustioribus laciniatis vestito; folio amplo, satis coriaceo, graciliter longique petiolato, oblongo, abruptiuscule acuto, crasso 5-nervio; pedunculo elongato, pendulo, bifloro vel interdum unifloro; bracteis majusculis, ovatis, acutis; floribus amplis; sepalis reflexis, triangulari-ovatis, obtusis, convexis; petalis reflexis, late oblongis, obtusis, convexis, margine tenuiter undulatis; sepalis dorsali paulo brevioribus; labello carnoso, trilobo, sepalis subaequilongis, hypochilio elongato cymbiformi superne incurvo et leviter dilatato laevi basi eornuto, mesochilii cornibus carnosissimis pendulis ligulatis acutis subfalcatis, epichilio triangulari-ovato acuto integro; columna elongata, leviter incurva, inferne leviter compressa, superne latiuscule bialata. Crescit in Columbiae prov. Antioquia. H. F. Claes.

and other ornamental species are either in unsuitable positions, or are hidden by less worthy specimens. A year ago there were no lawns, unless a meadow-like greensward may be described as such; there was no kitchen-garden, and the Rockery, which, in spite of its neglected condition, may be capable of improvement, was utterly overgrown with undesirable plants. Mr. Christy has done much in the direction of improvement, by attacking the most needed reformatory first. There is now, therefore, a kitchen-garden, with good crops of vegetables, and young fruit-trees have been planted. There is a conventional but pretty flower-garden close to the house, and the surrounding lawn has been brought into as good a condition as the time would permit.

Walking with Mr. Christy through the vegetable-garden, we were made aware of a fact that we suspect

In this way Mr. Christy acquires plants without names, but with wonderful descriptions. They frequently turn out to be unimportant, no doubt, but now and again quite a new plant is flowered. Thus we were shown a new ornamental Begonia, several important Rubber-plants, and other species that may turn out to be valuable. But there is no doubt in respect of such well-known plants as the Coffees, Vanillas, Cocos (Erythroxylon Coca, and Theobroma Coca), which we noticed in some quantity, nor as to the Ginger (Zingiber officinale), the Pepper (Piper nigrum), the Arrowroot, &c. Piper nigrum produces the Pepper of commerce, though there are many other sorts of Pepper that are obtained from other genera. All Pepper-corns are black, and the white form is obtained by fermenting the seeds. Black Pepper has always the best flavour.

experimental stage, it may be possible to utilise the full length of the fibre contained in this plant.

We next notice the Cassia in bloom, the origin of the school-boy's medicine—"senna." It is a yellow-flowered leguminous plant, of quite ornamental appearance. One species, *C. occidentalis*, of the Indies, furnishes a Coffee in use by the negroes. Next is the Guaiacum officinale, which yields the Gum Guaiacum of commerce, and a very heavy wood also; Eucalyptus in several species; and the Cinnamon (*Cinnamomum zeylanicum*). This Lauraceous plant furnishes the best Cinnamon, and is cultivated extensively for the purpose in Ceylon. *Cecropia peltata*, the Trumpet-tree of the West Indies and tropical America, said Mr. Christy, will supersede the Bamboo for many purposes; its hollow, light wood grows very quickly. A friend sent the plants from Columbia, advising that they be planted out-of-doors, stating that in that country the tree grows to a height of 60 feet. *Passiflora edulis*, and many other economically interesting plants we saw, but must refrain from enumerating them. As we looked at a plant of *Ilex paraguayensis*, Mr. Christy surprised us by remarking that it is in great demand, and that even in England there are thousands of people now taking the Paraguay Tea as a beverage. We tasted it, a long time ago, but our memory of the liquid is still vivid, and we have no intention of repeating the experience. On the roof of one of the houses were *Cissus discolor* and *C. albonitens*, the latter with aerial roots 8 feet long. A variety of purple-leaved *Coleus* was noteworthy too, the leaves being larger in all respects than is usual.

Near to the southern entrance to the residence is a very old plant of *Wistaria sinensis*. It has been slung across to a variegated Holly-tree, and now covers the top of this. An iron chain from one to the other has become embedded at either end, through the growth made by the *Wistaria* and the Holly.

Before taking leave of Mr. Christy, our attention was drawn to a Wardian-case, then being filled with young rubber plants (*Castilloa elastica*) for exportation. The plants were dibbled into a compost in rows, and a flat lath placed over the surface between each. Then two laths were placed longitudinally along the sides of the case, and over the ends of those between the rows, thus securing the soil and plants from becoming loosened.

SHORT NOTES ON BULBOUS PLANTS.

(Continued from p. 98.)

HYMENOCALLIS (PERUVIAN SECTION).—The Peruvian species of *Hymenocallis* are really worthy of more extended cultivation than they now receive; they all produce beautiful flowers, are deliciously fragrant, and are of comparatively easy culture: they require a cool temperature during growth, and are very desirable plants for conservatory decoration.

H. (Ismene) Amancaes.—This is perhaps the most beautiful of them all: it has from eight to ten strap-shaped, distichous, grass-green leaves, 2 feet long, sheathing at the base; the flowers, which are usually four in number, and are borne on an erect scape 2½ feet long, are of a clear lemon-yellow colour, and measure about 4 inches across from tip to tip of the segments. The staminal cup is trumpet-shaped, 1½ to 2 inches across, six-lobed, with a somewhat fringed margin, lemon-yellow in colour, shading down to a light-green at the base; the filaments are adnate to the cup, and form six rich green lines on the inside, curving acutely at the margin to form a sort of barrier across the cup, evidently to facilitate insect fertilisation. The fragrance is very marked, perfuming the whole house in which it is growing, and may be said to be unlike anything else. Two flowers are usually open at the same time.

H. (Ismene) calathina.—This species resembles *H. Amancaes* in all its parts excepting the flowers, which are creamy-white in colour, and possibly a

FIG. 34.—STANHOPEA MADOUXIANA. (SEE P. 134.)

gardeners in rural districts may not know so well as their suburban confrères. The Cabbages were protected by nets, just as were the Strawberries; and it was affirmed it is difficult to preserve the Brassicas from the voracious appetites of the wood-pigeon. Mr. Christy has for many years been a zealous Fellow of the Linnean Society, he is also the head of a large firm of wholesale City druggists, and one department of his garden indicates that his greatest interest lies in the cultivation and distribution of economic plants. There is a good collection of these interesting plants, which his special knowledge of the value of drugs has led him to acquire. Mr. Christy disposes of the plants commercially over the whole world. He must have a wide correspondence, for as we pass along the house, this plant is described as having been sent from the West Indies, that from Queensland, the other from Colombia or Japan, others from east and west Africa, and so on.

The Nutmeg-tree too, is here. It is *Myristica moschata*, or officinalis, and grows to 25 or 30 feet in height, being cultivated extensively in the Banda Isles, Sumatra, Java, and the Mollucca Isles. There is also a large Camphor tree 9 feet high. Close to the plants which furnish all these tasteful articles was the deadly poisonous *Strychnos* (*S. nux vomica*), a member of the Loganiaceous group, almost all of which are more or less poisonous. The *Strychnos* is a native of India, grows to a moderate size, and its fruits somewhat resemble Oranges. Besides being a deadly poison, *Nux vomica* is also a valuable drug. There were many varieties of the *Strophanthus* that yield the heart tonic. Next we notice the Mahogany-tree (*Swietenia Mahogani*), but there are many kinds of Mahogany from various countries, and obtained from different species of trees. Passing a species of *Hibiscus* in bloom in the stove, Mr. Christy observed that by a new process, yet in an

trifle more fragrant; it makes a fine companion plant to *H. Amancaes*.

Hymenocallis (Ismene) Macleana is like a small *H. calathina*, with a little more green inside the staminal cup; the leaves are shorter, and the plant is hardier than the two preceding species. These species like an open and somewhat sandy soil; they require good-sized pots (24's will do for full-sized bulbs), and they should be started in a temperature of 55°, water being withheld until the growth appears above the soil—the bulbs should be quite buried below the surface. Once fairly away, water must be given in abundance, and the house carefully shaded till the flowers appear, or the leaves will collapse; it is advisable to loop up the leaves with a ring of wire or some other means, to prevent them from snapping off, as when young they are very brittle, the leaves if broken spoiling the contour of the plant. After flowering, they should be placed under a low-branched tree or on the shady side of a fence till the leaves turn yellow, just sufficient water being given to keep the soil damp, the object being to keep the foliage green as long as possible. If removed to a house again, the leaves go off quickly, and the bulbs have an unnecessarily long rest. When fairly at rest they must be kept dry, and stored in the Cape-house till growth commences in the spring.

Ismenes may be propagated by offsets or seed, *H. (I.) Macleana* being the most prolific in offsets of the three; it will be found quite hardy planted at the foot of a south wall where a little shade can be given. Several clumps of bulbs are now flowering freely which have been out all winter with me; they were planted 6 inches below the surface, and kept as dry as possible till they appeared above the soil. I notice the spathes droop somewhat during very bright sunshine, but they become erect again at night, and remain so during dull days. *G. B. Mallett*.

BOOK NOTICE.

PANSIES, VIOLAS, AND VIOLETS.

THIS little book, published by Messrs. Macmillan & Co., forms one of "Dobbie's Horticultural Handbooks," and though comprising in all no more than 100 pages, is written or compiled by four experts, viz., Charles Jordan, John Ballantyne, Jessie M. Burnie, and W. Cuthbertson. These act as chamberlains, marshals, and heralds to Queen Viola, whilst her poet laureate, whose name is omitted from the title-page, is the Rev. Dr. Williamson.

The history and evolution of the Pansy are very interesting, though, as usual, the earlier raisers took no pains to keep accurate records, and so many of their statements remain conjectural or unsubstantiated. The natural form of the Violet, which is the source of all the varieties introduced by the skill and patience of the raiser, is very unsymmetrical, but growers know no peace of mind till they have converted the unsymmetrical flower of the field into the circular blossom of the exhibition stage. To enhance size (within limits), colour, substance, and fragrance are worthy objects of attempt. To alter the character and form of the flower without reason smacks of caprice or mischievous meddling. The natural form of the flower has a history and a meaning. It tells of centuries of gradual adaptation and of the reciprocal action of insects; it affords a clue to the genealogy and relationships of the plant. It is no mere purposeless, capricious arrangement of sepals and petals, but the outcome of adaptation and purpose. Can we say so much of a flower distorted from its natural shape, and with all or much of its history deliberately effaced? The richness of colour and its distribution, the smoothness of outline, are matters wherein the florist has wrought great change for the better; if he would follow Nature's indications in other respects as well, he would, we are sure, reap a rich reward.

In the meantime, if we put aside all such considerations, and look on florist's flowers as the outcome of the fancy of the raiser or the taste of the spectator, it must be admitted that the Pansy growers

have greatly enhanced the pleasure of our gardens and the glories of the exhibition-table. Particularly are we indebted to those growers who have given us so much beauty in the "Violas," or "Bedding Pansies," for we do not pretend to be able to draw the line between them. The plants, whatever their name, are easy to grow, not fastidious as to soil. The wealthy may expend more upon their favourite plants, but spend as they may they cannot get more pleasure from them than can the growers of these inexpensive plants, which are thus popular in the best sense of the word. We have good reason, therefore, to thank the compilers of this little work for a very interesting history of the group, and for vignette portraits of those who have been prominently concerned in it. The chapter on the Botany of the Pansy is worthy of commendation, but we should have been glad to have seen the substance of Dr. Wittrock's paper, also given as by far the best account we possess.

It is needless to say the cultural details are up-to-date, and we fully sympathise with the authors in their desire to see the culture in pots revived. Any one who has a frame may enjoy a profusion of bloom in late spring and early summer, as occurred fortuitously to the present writer.

Mr. Baxter, in a letter to one of the authors, gives the history of the popular variety *Duchess of Fife*. This originated from Goldfinch, as a sport or bud variation. The sport showed itself at one joint, hence Mr. Baxter "lifted the plant, took away the shoot with a few rootlets attached, cut the shoot down to the joint, where it sported and left only two leaves at that joint, and made it grow at that joint only. As it sported only in dry weather—both times—I thought it advisable to keep the sport dryish till it grew through the sporting-joint, and I therefore buried a 6-inch pot upside down and planted the shoot just above the pot, placing a hand-glass over it during rain."

In speaking of the use of *Violas* for the flower-garden, it is not possible to overlook the great services of the late John Fleming, stimulated as he was by the taste and enthusiasm of Harriet, Duchess of Sutherland (not Mary, as our authors write).

HAMPTON COURT.

THE royal gardens are looking extremely well this year; all the best features of the past years are maintained, bad ones have been expunged, and new ideas adopted with very pleasing results. I went on August 2, the day after Bank Holiday, generally rather a bad time to choose, 'Arry and 'Arriett often being a good deal in evidence. This year, however, there were fewer of the genus parading the gardens, and those present behaved in a more orderly manner than usual. Education has been beneficial in this particular at any rate, whatever other evils it may have caused or failed to eradicate. Nature, as represented in plants, being more interesting than the human species, to us, just now, I will try to describe a few of the best and most striking beds. A very pretty one was composed of the blue *Campanula carpatica* and its variety *alba*, the edging being a dwarf, dark-leaved, scarlet *Nasturtium*. Red, white, and blue, mixed, sometimes look vulgar, but this bed was not in the least so. I should say by the number of buds yet to come out, that it would last in perfection to the end of August, or even longer. Another attractive bed was a round one filled with various-coloured *Antirrhinums*. There is something very pleasing to the eye in a group of these flowers. Their colours are so rich, the habit is so good, and the fact that they do not require staking, gives them a natural appearance, which is by no means their least charm. Interspersed were a few of the *Tom Thumb* kind; these, though not so graceful, help to cover the soil between the taller ones, and so fulfil a good purpose. We all know what a charm there is in novelty, and that this is so in plants, no less than in other things, is evidently the theory of the authorities of these gardens. One bed especially was distinctive in

this respect. It consisted of golden-plumed *Celosias* and a blue-grey *Selaginella* as a carpet, I was going to say but, really it was not planted closely enough for that, as it showed a good deal of the cocoa-fibre between. But, notwithstanding, it was a pretty bed, and moreover, could easily be copied. So also could another pretty bed filled with the tall *Campanula pyramidalis*. It was, I suppose, intended to be all white, but an interloper at one corner had turned out blue. This plant is elegant in form and not difficult to grow well.

There were several beds of subtropical plants, some of which looked very handsome and stately, but there were others which did not look at all happy, notably some Palms of a decidedly bilious hue. I suppose the first cold days of June had tried them, or they may not have been hardened off properly. On the other hand, it is not often one sees a greenhouse plant in such splendid health out-of-doors as was the *Plumbago capensis*. Each plant was a picture of beauty, both in form and colour, a credit indeed to all. There was a very good circular bed of a salmon-pink *Carnation* much resembling *Raby Castle*. The flowers were plentiful and compact, not splitting the calyx to any extent, and the "grass," being abundant and of a healthy hue, set them off to perfection. A few beds containing flowers which grew rather stiffly and much the same height, were not a success, though otherwise well set out from the absence of tall and graceful foliage plants wherewith to relieve the monotonous level. I noticed one marked difference in this year's bedding, one likely to please too—the number of carpet beds has "grown beautifully less." When we did come upon one, "the consequence was," as the children say, it was quite a treat, forming, as it did, such a complete contrast to those around it. "Quite a work of art," was our verdict.

The long border on a line with the back of the palace has a sweet old-world look. It makes one think of the days of long ago, when the staid King William and his wife Mary paced the walks in happy content at having a few hours to spend away from all the poms and ceremony of what was even then the busy, noisy world of London.

The plants were well arranged, and most of them were very well grown. The *Hollyhocks*, both double and single, were very fine, as also were several specimens of *Bocconia cordata*, a graceful hardy perennial, which ought to be seen in gardens more often. Annuals, too, were well represented in this border, the *Salpiglossis* being particularly beautiful. There were some of a velvety-crimson colour, and a little way off were some so dark that they were almost black. I fancy these would have looked better if placed amongst the lighter ones, as their appearance was very sombre. There were several groups at short intervals of the bulbous *Hyacinthus candidans*, with its white bells and rich green leaves. This plant evidently enjoyed the situation, as I have never seen it look more healthy. Another plant, *Anemone japonica alba*, did not seem to relish its surroundings, for there were scarcely any buds to be seen. I was surprised at this, as in the gardens in the neighbourhood they were all in bud, and some in bloom.

There were some good *Asters* (*Michaelmas Daisies*) out, some of the blooms were from 2 to 3 inches across, and the shades were lovely. Dotted here and there were clumps of *Beet*. The colours were bright, certainly, but to my mind they did not improve the border. We forgive their appearance in the flower-beds in winter, for they supply gaps which would otherwise be difficult to fill; but in summer, when there such a wealth of richly-coloured flowers and foliage plants to choose from, they do not seem to be required.

There are some delightful grassy walks on the other side of the wall, along which this border runs. It is very pleasant to wander about here, the grass is so soft to the tread, and there are so many attractive objects for the eye to rest on. The *Yuccas* were in full bloom, and towered up some 8 or 9 feet high, their topmost flower-bells just catching the glorious rays of the setting sun, and reflecting, in consequence, a faint pinky hue. This seems to have been

a good year for these shrubs, albeit one might have expected just the reverse.

The Roses were all but over, but the almost perpetual-flowering Violas looked very pretty. One clump especially was very fresh and bright. The flower was of a primrose-yellow colour, with a distinct purple edge to each petal. Most of the plants I have mentioned were not labelled, so far as I could see, but this Viola bore the name "Duchess of Fife," somewhat to my surprise, as it was the counterpart of one called "Goldfinch." The latter possesses a delicious perfume, much stronger than that of almost any other Viola; but with this exception the two are identical; indeed, on reaching home I looked out the names in question in the cata-

other things there were which merit a word on their behalf, but for lack of space I must now close this article, hoping that my readers will go and see for themselves what a great amount of quiet pleasure can be obtained from a saunter round these charming old gardens. *V. P. Biddles, Kingston-on-Thames.*

PLANT NOTES.

ARISTOLOCHIA SIPHO.

WE remark in the last issue of *Möller's Deutsche Gärtner Zeitung* a notice of this handsome climber, and an illustration from a photograph of the plant in

writer of the article, Mr. A. Rehder, of the Arnold Arboretum, U.S.A., recommends that the *Aristolochia* be planted at some distance from the bole of a tree, and when the growths are strong enough, to take them up into the crown direct from the ground, so as to afford the young shoots a good opportunity of climbing unassisted into the tree. If a strong young plant be set out in good soil, one has not to wait for many years for a good effect.

EREMURUS ELWESIANUS.

OF all hardy Liliaceous plants, none is more striking than the species of *Eremurus*, and of all the *Eremuri* none is more beautiful than *E. Elwesianus*, with its noble spikes of starry, rosy-white flowers. It is very handsome as a specimen plant, but what a row of it looks like may be judged from the accompanying illustration (fig. 35, p. 137), obligingly forwarded to us by M. Marc Micheli, whose garden near Geneva is a veritable treasure-house of new and interesting species.

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 79 to 85.)

(Continued from p. 117.)

5, SOUTHERN COUNTIES.

BERKSHIRE.—Owing to the late season and deficiency of rainfall, I can hardly express an opinion as to the "quality" of fruit, with the exception of Strawberries, Raspberries, and small fruits, which are abundant and very good. Strawberries very heavy crops of most varieties, and the flavour is good, but not very fine fruit, and the season will be short here, unless rain comes soon. The land is very dry and cracking, and the rainfall for the last six months has been only half the average for the district. *Owen Thomas, Royal Gardens, Windsor.*

— The prospect of a good fruit crop was of the most promising in the early part of the season, but the fulfilment has come far short of the average in our immediate neighbourhood. Pears are very scarce, and Morello Cherries, that set remarkably well, have lately cast most of their fruit. Nectarines on walls are a very scarce crop, but Apricots promise some good fruits. We suffered a great deal from the cold nights in May, and had a deal of blight. *J. Howard, Benham, Newbury.*

— Apples, although below average, are a better crop in this district than last year, there being a sprinkling of Blenheim Orange Pippin and other late-keeping varieties which failed us last year. Pears are a poor crop on wall trees, worse on pyramid trees, and almost absent in the orchard. Of Plums, Victoria only has a full crop on wall trees, but all kinds are a failure on trees in the open. Sweet Cherries a good crop on wall trees, but there is none on orchard standards. Peaches and Nectarines are an average crop, and the trees are healthy. Apricot trees were in full bloom when we had the coldest weather of the winter, the end of March, consequently the crop is poor. Strawberries, though late, have been an enormous crop, and the bulk ripened satisfactorily. *T. Turton, Maiden Erlegh Gardens, Reading.*

DORSETSHIRE.—Apple trees are badly infected with mildew, and bear a short crop; and the best varieties are Beauty of Kent, Cockle Pippin, Dutch Mignonne, Ecklinville, Ribston Pippin, and Striped Beaufin. Pears are also very short; the best of the varieties are Ne Plus Meuris, Catillac, Beurré Diel, Glou Morceau, Madame Treves, Marie Louise, and Williams' Bon Chrétien. Strawberries have been very good, especially Royal Sovereign. *Thos. Denny, Down House Gardens, Blandford.*

HAMPSHIRE.—Fruit crops are, on the whole, disappointing, considering the wealth of bloom and general prospects in early spring, the prevalence of cold, damp weather being no doubt the cause of the partial failure of crops. Small fruits and Strawberries are really the only good crops here, the latter especially having been very good, Royal Sovereign

FIG. 35.—EREMURUS ELWESIANUS, FROM THE GARDEN OF M. MARC MICHELI, NEAR GENEVA.

logue of a nurseryman who makes a speciality of Violas, and found that almost the same description was given to both. We have, I think, quite a big enough nomenclature without all these needless synonyms so common in horticulture. *Eryngiums* always seem to have an aristocratic air about them wherever one meets them, and those at Hampton Court showed particular signs of blue blood in their veins, the leafy bracts, covered with a delicate bloom, looking lovely in the evening light. These plants should have more extended culture in the grounds surrounding "the stately homes of England," for they give an air of distinction not always easy to be got. Both this and the *Echinops* (Globe Thistle), of which there were some fine specimens, require a background of shrubs to do them justice. Many

the botanical garden at Jena. Too often *Aristolochia siphon* is employed in a formal way to cover a pergola, an arbour, or a wall, none of which methods shows the entire natural beauty of the plant. But allowed to climb into a tall tree or trees without any assistance from man is the manner to show off the capabilities of the plant, and bring out all the beauties of this Liana-like climber. The ground as well as the branches and limbs of the tree is covered with a complete tangle of the thin *Aristolochia* stems; and from these spring other stems clambering into the light by the aid of the old stems, and adding greatly to the picturesqueness of the whole.

Naturally, a planter would not plant an *Aristolochia* against a valuable tree, as its embraces would, it is to be feared, end in the death of the tree. The

having quite maintained its character as one of the best varieties grown. Monarch has been disappointing here, about 75 per cent. of plants, both old and young, failing to bloom. Pears are best on walls, both espalier and pyramid trees being a failure. Amongst Plums, Victorias are much the best. *Wm. Pope, Castle Gardens, Highclere.*

KENT.—This year, thus far, has proved to those growers who have all their eggs in one basket that it is a mistake. Take, for instance, Cherries. For several years past this fruit has paid better than any other fruit—Hops not excepted; consequently, large breadths have been planted; but I regret to say that, owing to adverse weather, the last two seasons have been most disastrous. Apples, although an average crop, have certainly not come up to expectations. The wealth of bloom was enormous, which set well in places, and there was promise of an enormous crop, but recently the fruits have dropped when of the size of a pigeon's-egg, and larger. All varieties seem to have suffered alike. We have fair crops of Ecklinville, Stone's, Golden Spire, Grenadier, Warner's King, Tower of Glamis, Worcestershire Pearmain, Ribston Pippin, King of the Pippins, The Queen, Frogmore Prolific, and Prince Albert; Blenheim Orange and Cox's Orange Pippins are poor, and the trees of Lord Suffield are entirely mildewed. Peach and other wall-fruit trees that were washed in the spring to clear them of aphids, have made good growth, but from present appearances, the fruits will be rather smaller than usual, owing to the cold nights we had in June and July. The crop of Gooseberries has been enormous; a large bulk has been gathered green, but immense quantities were left on the bushes to ripen. One of the best—if not the best—grown in this county, is Howard's Lancer, a strong grower, fruit white, of enormous size, splendid quality, and a heavy cropper. Strawberries: Royal Sovereign was excellent, carrying an enormous crop of large fruits of good quality. If flavour is wanted, what have we to equal Dr. Hogg, or the Viscountess? I saw these two varieties remarkably good at Mr. Bunyard's grounds; the plants were exceptionally strong and well cropped owing to the method of selection this firm employs. Plums promise well. Early Rivers especially is carrying a large crop. Damsons, perhaps, will be over average. American blight is very prevalent this year, the trees in many old orchards about here are white with it, and I find it necessary to wash with quarter pint of petroleum to four gallons of water to keep the pest in check. We use a Vermorel's knapsack, and well mix the oil and water in a can with a syringe; afterwards it can be kept mixed by the operator shaking the vessel upon his back. *Geo. Woodward, Gr., Barham Court, Maidstone.*

—The fruit crops in this part of Kent are very satisfactory. Apples are very plentiful with us; trees of Cox's Orange Pippin are very heavily cropped, and we have been obliged to thin the fruits of many of the common varieties. No caterpillar pest has devoured the foliage. The Pear crop is patchy, and it is only a few varieties that are bearing fairly well. Peaches and Nectarines set well, and blister has given us but little trouble; on the whole the crop is a heavy one. Raspberry Superlative has done excellently, and it is getting generally liked. Attention to affording water to the roots of fruit trees, owing to the drought, has been very necessary. *H. Markham, Northdown, Margate.*

—A peculiarity of the season in this district is the abnormal quantity of "vermin" on Apple trees, which give the trees the appearance of being scorched. The Apple trees are troubled, too, with a new pest in the shape of a dark fungus growth, nearly like ordinary mould, except that it is a dirty black-brown colour. This is most apparent on Lord Suffield Apples, and a few kindred varieties. *Champion Brothers, Mereworth, Kent, and Boro' and Covent Garden Markets.*

MIDDLESEX.—The trees never promised better early in the season, and after a poor crop the previous year we expected good crops this year, but the result is poor indeed—we never had fewer Pears. Early

varieties of Apples are cropping well, but good keepers are very scarce. Plums are a failure, both wall, trees, and others. Apricots, Peaches, and Nectarines are thin, doubtless owing to the frosty winds experienced when the trees were in bloom. *G. Wythes, Syon House Gardens, Brentford, W.*

—The promise on all fruit trees indicated a record year, but the cold winds and cold nights up to the end of June seriously affected all the crops except the Apple crop, which is very good. I have never known such a bad season for aphids. The Peach, Cherry, Plum, and Red Currant trees have been violently attacked, particularly the first-mentioned. *S. T. Wright, Royal Horticultural Society's Gardens, Chiswick.*

—All fruit crops outside with us are much later than usual this year, fully ten days. The most disappointing crops are Plums, and next to these Pears, both of which promised so well. These were in flower earlier than usual, a spell of cold weather punishing them severely at the critical period. Apples were held in check in time by the cold which did this harm, hence they escaped. Cherries are a very heavy crop on walls, and of good quality, but correspondingly late. Apples are good, and are swelling freely. Strawberries also are excellent in crop and quality. The green-fly was very troublesome to the Peaches and Nectarines, persistently so, but, thanks to a free use of Quassia extract, it was beaten. The black-fly was not so troublesome, but every appearance of it was attacked with the same remedial measures. The drought in this locality is becoming serious, watering being a heavy item of labour. *Jas. Hudson, Gr., Gunnersbury House, Acton.*

SURREY.—Having been pretty well all over the county of Surrey, I have found the best tree crop to have been Cherries, although these were not a fine sample. Morellos set abundantly, but have very much fallen since. Apples are a very light crop even in the warmer districts. Pears and Plums are still smaller; indeed, may be described as miserably thin. The best crop of the year is found in Gooseberries, as these seem to have been everywhere in remarkable abundance. Red and Black Currants are very fair crops, but want rain to swell the fruit. Raspberries should be abundant also. Strawberries have been good in holding soils, and where well mulched; in light soils the crop was moderate, except on young plants, and where cultivation was of the best. Small Nuts and Walnuts seem generally plentiful. We have seen enough this season to make us credulous as to the value of a great show of blooms in the spring. *Alex. Dean, Kingston.*

—Never before had the fruit-trees given better promise of an abundant harvest until late frosts affected the crops, so that in many places a very moderate harvest will be the result; here, however, we have partly escaped the general havoc, and have heavy crops of Apples, and taken all through, Pears are also good, though some varieties, notably, P. William's Bon Chrétien, are rather thin; small fruit generally is good, Morello Cherries being an exceptionally heavy crop. Blight and insect pests have been troublesome. *J. F. McLeod, Gr., Dover House, Roehampton.*

—Apples are swelling fast, and promise to be good. The varieties that are the best cropped are culinary varieties Duchess of Oldenburgh, Stone's, Ecklinville, Lady Henniker, Grenadier, Wellington, Lord Grosvenor, Tower of Glamis, Mère de Ménage, Golden Noble, Stirling Castle, and Hornead's Pearmain, one of the best late Apples. Dessert: Mother, Lady Sudeley, Ribston, and Blenheim Orange Pippins. Strawberries are fine in berry, but owing to the drought were soon over. Raspberries were good, especially Superlative. *C. J. Salter, Gr., Woodhatch Lodge, Reigate.*

WILTSHIRE.—On walls protected by glass coping, all fruit crops are good in these gardens, viz., Apricots, Pears, Plums, Cherries, Peaches, and Nectarines, also Figs, but without such protection they are comparative failures. In many instances not only the fruit, but the leaves also, are destroyed. Those varieties which have suffered most severely are Lord

Suffield, Sturmer Pippin, Alfriston, and Cornish Gilliflower; and in Pears, Marie Louise, Forelle, Bergamotte d'Esperen, and Glou Morceau. In some instances the trees are almost leafless. This injury was undoubtedly caused by the exceptionally cold weather we experienced throughout the month of May, as well as by a terrific hailstorm we had on June 2. *T. Challis, Gr., Wilton House, near Salisbury.*

(To be continued.)

BUDDLEIA VARIABILIS.

DR. HENRY was the first to discover this plant in the mountains north of Ychang. Mr. Hemsley was the first to describe it in the *Journal of the Linnean Society*. It was introduced into France in 1893, and exhibited for the first time at a meeting of the National Horticultural Society of France in 1894. On March 16, 1898, a coloured figure was given in the *Revue Horticole*, together with a description from M. Maurice de Vilmorin. Later still, in the same year (August, 1898), it was figured in the *Botanical Magazine*, t. 7609. Specimens have been obligingly sent to us by Mr. Gumbleton and Messrs. W. Paul & Son, of Waltham Cross. By the last-named exhibitors the plant was exhibited before the Royal Horticultural Society, and obtained an award. It is unnecessary, in the face of so much description and illustration, (see fig. 36, p. 139) to say more than that it is (presumably) a hardy shrub, with much of the habit of *B. Lindleyana*, a species we have found to be hardy, unless in exceptionally severe winters, when even *Buddleia globosa* is killed to the ground near London. The leaves are shortly stalked, lanceolate, acuminate, finely serrulate, dark green, but covered with a thick white felted stellate down on the under surface, and with small ear-shaped interpetiolar, leafy stipules at the base. (See Masters on the "Foliation and Ramification of *Buddleia auriculata*, *Journ. Linn. Soc.*, December 1, 1881.) The density of the inflorescence its degree of branching, the more or less foliaceous nature and conspicuousness of the bracts, are all subject to variation, as is likewise the colour of the flowers. Generally they may be described as more or less deeply lilac, with an orange throat; but as the specimen withers, they speedily become uniformly brown. M. de Vilmorin notes the variation in colour, and so does Mr. Gumbleton, in a letter with which he has favoured us, so that the term *variabilis* is well justified.

MARKET GARDENING.

MR. P. R. MORSE'S FRUIT-FARMS.

THE chief industry within a radius of 3 miles from Hatfield Peverel and Witham (both places having stations on the main-line of the Great Eastern Railway Company) is that practised on Mr. P. R. Morse's fruit-farms. So great indeed is the industry thus afforded, that nearly all the yearly holidays given to the children attending the several local schools are merged into one extended term, so as to fit in with the fruit-picking, commencing with the Strawberries, and following with Raspberries, Black Currants, Gooseberries, and Red Currants. As they are paid so much per pound and peck for gathering the several kinds of fruits mentioned above, mothers and their children earn good wages during the period covered in gathering, the produce of about 60 acres of Raspberries, and 40 acres Strawberries, Currants, and Gooseberries, heavy crops of the several kinds of fruit indicated being secured, packed, and despatched to London and other large commercial centres. A space of 5 feet is allowed between the rows of Raspberries, which include such excellent varieties as Carters' Prolific (mainly) and Superlative, the intervening spaces receiving a good manual surface-dressing as considered necessary in order to maintain a vigorous and fruitful growth in the canes, the horse-hoe or cultivator being run between the rows of canes two or three times in the year, as much with a view to stirring the soil to accelerate growth as to cut down any weeds that may spring up. The same

FIG. 36.—BUDDLEIA VARIABILIS: FLOWERS LILAC, WITH A GOLDEN EYE. (SEE P. 138.)

remarks apply to plantations of Strawberries, Gooseberries, and Currants.

Plantations of Tomatos to the extent of three or four acres, set in rows $3\frac{1}{2}$ feet apart, and at about 1 foot from plant to plant in the rows, were bearing good crops of fruit, some of which were beginning to colour at the time of my visit (August 6). The plants are secured to a wire running along each row, about 15 inches from the ground, and fastened to small posts driven into the ground at intervals, close enough to keep the individual wires fairly tight. The natural soil being of a light gravelly description, and not so deep as could be desired, the plants appear to have been either planted on the top of "raised" drills or ridges, or to have had some soil drawn up to them on either side afterwards, with a view to affording a greater body and depth of soil for the plants to root in, and at the same time to ensure a more uniform degree of heat and moisture about the roots. The plants, as might be expected in the conditions mentioned, coupled with the long spell of dry, sunny weather which prevailed up to the day of my visit, have made a dwarf, sturdy, and fruitful growth. The much-needed rain which fell steadily the whole of the following day (Sunday) will prove most beneficial to the crop in swelling up the fruits considerably, and if followed by fine, sunny weather for a week or two, remunerative crops of fruit will be secured from these plants. We may add, that Tomatos have been grown four years in succession in the same ground, and evidently without exhibiting any ill-effects in consequence thereof, although one might have reasonably expected the ground to have become "Tomato-sick" as a result.

Plantations of Apples and Plums have been made in recent years. It may be interesting to know that it is only eight or nine years since Mr. Morse began fruit-growing on certain portions of his farms. The several fields devoted to the culture of fruit are favourably situated as regards situation and aspect, the soil being also suitable for the purpose. Mr. Morse's fruit farms extend to within one mile of Hatfield Peverel station (whence all produce is despatched), and to within 3 miles of Witham, the latter town being the postal address.

THE HATFIELD PEVEREL VINERIES

are situate a little over a mile from Hatfield Peverel station. They consist of eight well-built and efficiently ventilated and heated spans, which have been erected within the last eight years, together with packing and potting sheds and engine-house, above which is fixed some feet above the highest house a large galvanised iron tank, from which the water is laid on to the several houses for distribution through the hose when attached to the stand-pipe, the supply being pumped out of a well by the steam-engine. No. 1 house is 110 feet long, 25 feet wide, and of good height. This house is planted with Gros Colmar and Muscat of Alexandria Grape-vines, Colmars being on one side, and Muscats on the other, the Vines being set 4 feet apart. No. 2 is 200 feet by 25 feet, and is planted with Gros Colmar throughout, with the exception of one Vine of Muscat of Alexandria, which was carrying 42 fine bunches on a 15 feet rod. No. 3 is 208 feet by 25 feet. It is planted with Gros Maroc, Gros Colmar, Lady Downes', Black Hamburgh, and Madresfield Court. The Vines (cut-backs) were planted in this and two preceding houses, seven years ago, and one and all were carrying immense crops of large solid bunches, consisting of large fleshy berries, the bunches literally touching each other. And in proof of this statement I may say that I counted thirty-nine bunches of Muscats on one Vine, which I selected as a fair sample of the crop in No. 1 house; some of these bunches would, I expect, turn the scale at $2\frac{1}{2}$ lb., and where well exposed to the influence of the sun, they were assuming the coveted golden-amber tint which is always present in examples of good cultivation of this much-sought-after Grape. I also counted ten good bunches of Gros Colmar on 1 foot of main rod. Equally heavy crops of fine bunches of Black Hamburgh, Lady Downes', and Madresfield Court are coloured, and colouring beautifully, as also is a

tapering, well-proportioned bunch of Gros Guillaume. The crops of Black Alicante and Gros Maroc are also very heavy, and give promise of finishing most satisfactorily. Readers of these notes may naturally ask, What about next year's crop? And my answer is, that judging from the exceedingly vigorous condition of all the Vines in the above-mentioned vineries, the wood being extra strong, short-jointed, hard, and brown, and the immense leathery leaves, and also bearing in mind the fact that the said Vines produced and ripened satisfactorily heavy crops—according to age and length of rod—during the two preceding years, my answer is, that the Vines, if subjected to the same skilful treatment that has been bestowed upon them during the last seven and a-half years by Mr. Young, the manager, will yield as good crops of Grapes next year as this. Of this I have no doubt whatever. There is a heavy mulch mainly of horse droppings on the Vine-borders, which had been watered a few hours before I made my visit of inspection, which prevented my seeing the description of soil which composed the borders, so, in reply to my question on this point, Mr. Young informed me "that the Vines were growing in the same kind of soil as the Tomatos, both inside and outside—light, gravelly soil!" "Then," I remarked, "you must feed the roots liberally and frequently with a good, rich fertiliser." "Yes," said Mr. Young, with a knowing smile, "the borders have been surfaced, dressed with artificials before applying water during the last few months." An examination of the mulch without disturbing it, revealed a net-work of young, quill-like roots—a fact which proved conclusively that a liberal and judicious use had been made of top-dressings of artificial and stable-manure, and that copious applications of water had been given at the roots to produce and ripen such enormous crops of first-class Grapes, and at the same time to make such splendid wood for another year. Not a trace of red-spider was to be seen in any of the houses. Before leaving the Vineries for the Tomato-houses I may say that it has never before been my good fortune to see such magnificent crops of Grapes—not even excepting the fine examples of Grape-culture which I have seen in the Clovenford and Fordingbridge vineries a few years ago.

No. 4 house is 225 feet long, 18 feet wide, and about 15 feet high from floor to bottom of ridge, contains 1,200 plants of Tomatos; these, like the plants in the four following houses, are secured to strings twisted loosely round the individual plants close to the ground, and fastened to longitudinal wires fixed to the rafters overhead, the plants being set in rows 18 inches asunder, and at 1 foot or so from plant to plant in the rows. And these in their several stages of growth—some finishing the tail-end of the crop, others in full bearing, and others swelling their first clusters of fruit close to the ground—bore evidence of sound cultural skill having been applied or directed by a master hand, the clusters of fruit and the individual fruits, smooth and round, being large and fine; I never saw better, if so good, the plants being very robust and clean, as well as prolific. The borders were not mulched, but they undoubtedly must have had generous applications of artificials immediately before applying ample supplies of water at the roots. Being Saturday, all the houses had been watered shortly before I arrived, and a goodly sprinkling of well-washed pebbles remained on the surface of borders in Tomato-houses. Houses Nos. 5, 6, 7, and 8 are respectively 100 feet by 25 feet, 160 feet by 14 feet (two), and 80 feet by 14 feet. The houses (mostly) have two-flow 4-inch pipes at front on either side, with one return on either side centre pathway. Mr. Strong makes a free and evidently judicious use of the top and side ventilators in his vineries and Tomato-houses.

In the vineries I observed several fine specimens of Maidenhair Fern (*Adiantum cuneatum*) for cutting from for marketing, and numerous plants of the Chrysanthemum and Pelargonium (scarlet and white) for the same purpose were located outside.

In conclusion, I should like to record my indebtedness to Mr. and Mrs. Strong for the hospitality and courtesy which they extended to me on the occasion of a most enjoyable and instructive visit. *H. W. Ward, Rayleigh, August 8.*

AMERICAN NOTES.

A NATIONAL UNIVERSITY FOR AMERICA.

WHILE it seems fortunately improbable that serious attempts will ever be made to establish this institution, there have been developed under the protection of the Government a series of scientific bureaux which, taken together, present many of the characteristics of a university, and which perform some of the same functions. This is very notably true of the original research work done in various lines of applied science under the immediate supervision of the Department of Agriculture. There are in this Department several well-organised, fully-equipped, and efficiently-officered divisions. One division is concerned with entomology, another studies vegetable pathology, another animal pathology, still another handles pomological problems; one division is devoted to questions of agricultural chemistry, and one to soil physics, and other divisions to other related branches. The original investigation in some of these divisions is of a very high order, and the facilities for advanced work in such agricultural-scientific problems are, in certain particulars, very attractive.

Up to the present time, however, these bureaux have been open to visitors only upon sufferance, and no students of any sort were admitted. Investigators in similar lines elsewhere in the United States, Canada, or Europe, have always been very liberally treated whenever they cared to make use of the libraries or museums of the Department; but such helps have been quite incidental to the regular work. It is plain to those who are familiar with the circumstances, that a small number of men, who are capable of the most advanced independent study, might possibly be accommodated with a more extended and systematic access to the facilities of the Department without in any way interfering with the present work. Such advanced students, under certain very strict regulations, could establish themselves in Washington, could use the laboratories, museums, libraries, and could have the counsel of the scientific experts there, and could therewith make better progress in certain lines of study than in any of the universities of the land. In fact, I know of one man who will presently go there in preference to taking work with one of the most noted instructors in America.

The officers of the Department of Agriculture have recently given these questions more than the usual amount of thought, and have seen their way clear to opening such opportunities in a limited way. Mr. Wilson, the Secretary of Agriculture, has lately announced officially the willingness of the Department to receive some such advanced students. His letter evidently rests upon a well-matured conclusion, and marks a new departure of the greatest importance to the more advanced study of the scientific problems connected with agriculture and horticulture. Mr. Wilson sets forth the facts and conclusions in his letter as follows:—

"Education in the sciences relating to agriculture, in an organised form, originated with Congress in 1863, when the agricultural colleges were organised, and in 1887 (I think) when the experiment stations were provided for. The best work done in these institutions is in their agricultural departments, where students are trained in the sciences related to agriculture, instead of getting a purely literary course of instruction. The United States, probably, has the best system of education along this line in the world.

"But when students are graduated in these institutions, they have no university especially designed for instruction in special work. The result is, that students who intend to prosecute some specialty after leaving college, begin to specialise in college, perhaps before they have become sufficiently trained in the subjects that pertain to a broad general education. There is really no time to specialise in a four-years' college course; it should be done afterwards, and, in fact, many of our best scientists have pursued post-graduate work in the institutions where they received their collegiate training.

"It has occurred to me that the sixteen scientific divisions of this Department could offer better facilities for this work than most of our agricultural colleges. Our scientific bureaux and divisions are directed by able men, are well equipped with laboratories and libraries, and the chiefs and assistants could direct the studies of a few young men without detriment to their work. It would not be necessary to charge either tuition or laboratory fees.

"The benefit to the Department would appear when wealthy colleges took away, as they sometimes do, our scientists, by offering them higher salaries than the law provides for the Department of Agriculture. When this occurred, we could turn to these young men for material to fill the vacancies. Moreover, when the colleges in the several States applied to us for young men trained in special scientific lines, we could put them in correspondence with students here.

"One hundred of these students could be distributed through our divisions without detriment to our work. The great object aimed at in establishing the system of agricultural education would thus be materially helped. Whether we would give degrees, or certificates of the work done, I have not yet determined. These young men, with the approval of the chiefs of division under whom they study, could be placed on the eligible lists of the Department without civil-service examination. It would open up another avenue for the young farmers of the country who devote time to the acquirement of knowledge along these lines." *F. A. Waugh.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Globe Artichokes.—Plants that have ceased to bear heads should be denuded of the old stems, cutting off these at the ground-level; and copious application of water afforded to the soil in order to enable the plants to mature the season's growth. Unless the Artichokes that were planted late in the spring of the present year were strong, and soon got well established, it is not desirable to allow them to produce more than three flower-heads apiece, and all others should be rubbed off when quite small. Let these young plants have plenty of nutriment in the form of liquid-manure water, and also a mulch of manure.

Cardoons.—In order to obtain fine stout stalks, the treatment should be identical with that of Celery. By the end of this month the plants should have attained their full size, when blanching may be begun; and the most convenient and best mode of blanching is to gather the leaves altogether, and wrap them round loosely with hay-bands or straw, and then earth-up in the manner of Celery. Growth during hot weather is greatly assisted by liberal applications of water to the soil, indeed at no time should the plant lack moisture at the roots.

Capsicums and Chilies.—Plants of Capsicums or Chilies that have been planted at the foot of south walls and on south borders will require frequent syringing, and considerable quantities of water, and when each plant has got the desired number of pods set upon it, the point of each growth may be pinched out.

Vegetables for Pickling.—This month is the most favourable for getting together Cauliflowers, French Beans, Onions, Cucumbers, Radish-pods, Nasturtium seeds, &c., for pickling. Each item should be gathered in perfect condition.

Potatoes.—Such varieties as are ripe should be lifted, dried in the sun for an hour or two, and then placed in small lots together in the Potato cellar, being careful first to sort out every diseased tuber.

Digging and Trenching.—Manure and compost-heaps may now be got in readiness for wheeling on to the vacant plots, if the land is of a heavy description, digging it early in the autumn; and with such land it is necessary to ridge it or leave it in a rough state. Those who trenched and dug deep last autumn and winter will find their crops suffer but little from the lack of rain this dry summer. Light land is not benefitted to the same extent by early digging, unless it is trenched.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Raspberries.—The whole of last year's canes of summer-fruited varieties may now be removed, so as to admit sunlight to the new ones. All weak canes of the current year may likewise be removed, only sufficient strong canes being left for next year's fruiting, or for making new plantations if these are contemplated. Mulching materials may be removed at the same time on cold soils and districts, and the surface stirred with the Dutch-hoe. It is not desirable to fasten the young canes that are left, provided they do not chafe against the supports; and if tying has to be done, the canes should be fastened singly to the wires. Weak plantations may be strengthened by applying firm-yard-drainings once a week till the middle of September, supplementing these with clear water.

Apples and Pears.—If any variety of fruit is required for exhibition or other special purpose, the trees should be assisted with liquid-manure, diluted in safe proportions according to strength, drainings from the farmyard or cow-shed, applying it at weekly or longer intervals. Liquid-manures made by soaking manure and soot in a tub of water require much care in their application, the soil being apt to get clogged with the solid matter contained in the mixture if the liquid be not quite clear, and nitrification is prevented. The ground over the roots for as wide a space as the application reached should always be moved with the hoe two days after the application, in order to check evaporation, and keep the soil in a healthy condition. Any leaves that shade the fruits must be removed, and injury by the birds must be prevented by covering the trees with netting; tits and blackbirds are the worst offenders, and once they get a taste, it is a difficult matter to keep them away from the trees.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Cattleyas and Lælias.—Some of the more forward plants of *Cattleya Trianaei* and *C. Percivaliana* will have completed the current season's pseudo-bulbs, requiring as a consequence rather less water at the root, and to be gradually exposed to more sunlight and ventilation. The compost of those plants whose growth is partially made, should be kept fairly moist, and be allowed to get dryish before water is afforded. Plants of *C. Mendeli* require the same kind of treatment; and those of *C. Mossiae* that are not yet showing their flower-sheaths should be carefully afforded water, the young growths being prone to decay; but when the flower-sheaths appear, the quantity of water may be considerably increased. *C. Schroderae* should be treated similarly; and *C. Bowringiana* will also require plenty of root-moisture till the new pseudo-bulbs are finished. Our plant of *C. Lawrenceana* has made some progress, and the plant is raised well up to the roof, but not exposed to strong sunshine. Until the flower-sheaths show, water must be afforded with discretion, gradually increasing the amount with the advance of the growth. Plants of *Lælia purpurata*, and the hybrids, *C. exoniensis*, *C. fausta*, *C. Lord Rothschild*, *C. Harrisii*, *C. Parthenia*, *C. Pheidona*, *C. Wendlandiana*, *C. Mantini*, *Lælio-Cattleya Canhamiana*, *L.-C. Wellsiana*, *L.-C. Eudora*, *L.-C. Pallas*, *L.-C. Nysa*, *L.-C. callistoglossa*, *L.-C. eximia*, *L.-C. Philbrickiana*, *L.-C. Phoebe*, *L.-C. Henry Greenwood*, *L.-C. Lady Wigan*, *L.-C. Amesiana*, &c., being in various stages of growth, must be treated each according to its needs. As the new growths of these plants approach maturity, gradually inure the plants to fullest light and more air. *Lælia pumila* and its varieties, *praestans*, *Dayana*, and *marginata*, being now in full growth, will need copious supplies of water when the compost gets thoroughly dry. These species are most thrifty when hung in a light position in the intermediate-house. The pretty hybrid, *L.-C. Blessensis*, an offspring from *L. pumila* and *C. Loddigesii*, and the rare *Sophro-Cattleya Calypso* also thrive most satisfactorily in a cool, intermediate-house temperature. *C. aurea* and its variety, *chrysotoma*, without doubt the handsomest Orchid at present in flower, should have the water-supply at the root gradually reduced as soon as the flowers open. For a few weeks the plants should be kept on the dry-side; the result of keeping the compost moist at this period is, that the roots do not sufficiently assist the plant to regain its vigour after flowering. The same kind of treatment is necessary for *C. Gaskelliana* and *C. Rex*, which are now in bloom. The autumn-flowering *C. labiata*, now in full growth, and showing its flower-sheaths, will need to be kept fairly moist at the root till the flowers open, when the supply must be lessened by degrees. *C. gigas*, *C. Warneri*, *Lælia tenebrosa*, and *L. cinnabarina*, now beginning to make roots freely, may be repotted or surfaced with fresh material. Plants of *Lælia anceps* and its numerous varieties showing flower-spikes, will need liberal treatment as regards light, sun-heat, and moisture, and the most favourable position should be allotted them in the Mexican or the *Cattleya*-house, slightly shading the plants overhead with tepid rain-water in the afternoon. The young growths are apt to topple over at this season, and it is prudent to support them with neat sticks. *Cattleya speciosissima* (*Luddeimanniana*), *Odontoglossum citreum*, and *Lælia rubescens*, should be grown under the conditions that suit *L. anceps*.

Pleiones will now require plenty of light, air, and water, till the foliage begins to change colour, when the compost should be kept merely moist. With the exception of *P. humilis*, *P. Hookeræ* and its variety, *brachyglossa*, all of the *Pleiones* thrive in a sunny corner of the *Cattleya*-house, and the species named are the better for being hung up near to the roof in the cool-house.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Vines and Vine-borders.—The renovation of the borders where Vines have shown signs of weakness from any cause must soon have attention, the old soil being replaced by new without the next year's crop being lost. It will take two years to complete the job if there be an inside and an outside border. The best time to commence the work is after the fruit is cut and the wood is ripe, and while the foliage is still green; and a beginning may be made forthwith if this season's crop of fruit is consumed. First, cart in or prepare the soil, the most suitable being middling heavy pasture loam, dug 4 to 6 inches thick; to this add one-eighth of mortar-rubble, chalk, plaster, &c., the light particles of which should be sifted out of it, and one-eighth charred soil, the whole being enriched with bone-meal at the rate of a quart to wheelbarrow load (1 cwt.) of soil. Very heavy loam may need a little more lime-rubble. If the vinery is a lean-to, begin taking out the soil next to the back wall, and continue working it out from between and beneath the roots till the front wall is reached, always guarding against damaging the roots with the digging-fork. Having done this, and wrapped the roots up with mats or litter, take out the drainage, and sweep the concrete at the bottom of border clean. The total depth of a border should not exceed 3½ feet, nor the drainage be more than 1½ feet deep. Should the border have been deeper, fill up with more drainage-materials rather than increase the depth of the soil, but should it have been shallower, decrease the depth of soil, and afford good drainage, this being very essential. Suitable materials for drainage consist of brickbats, sandstone, limestone, or even chalk, as this is not disintegrated if the frost cannot reach it. These things should be placed evenly by hand on those the next size, and the smaller on the top on the concrete floor, the bigger pieces at the bottom. The whole may be covered with a layer of sods placed close together, with the grass downwards. Then proceed to fill in the soil the full length of the vinery, making a bank 5 or 6 feet wide, building up sods in regular courses at the outside, so as to form a wall. When the filling-in is brought to within 6 inches of the surface, lay the Vine-roots in the soil at various levels, at the same time cutting back damaged roots to sound wood, making the soil firm about them, and afterwards afford water copiously, so as to moisten the whole mass of soil. The whole work should be done expeditiously, and the Vines shaded for a time with hothouse shading or by whitening the roof-glass, and in bright weather moisten the leaves twice a day, and ventilate sparingly, and only on the top of the house, keeping the ventilators a little bit open throughout the night. By taking care of the foliage, the roots will be induced to move, and establishment will partially take place before the winter. The present is a suitable time to cart in soil for use during the coming season, and a calculation should be made of the quantity and kinds required for Vine-borders, for Pines, Peach-borders, Cucumbers, Melons, &c.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Euphorbias (Poinsettias).—Any later plants of *E. pulcherrima* not yet finally potted should receive attention without delay, and it may also be necessary to afford a shift to larger pots of those plants in 5 or 6-inch ones, which are making vigorous growth and are already furnished with plenty of roots, the doing this tending to keep the growth vigorous and the bottom leaves from becoming yellow and falling off. Plenty of air should be afforded the plants, and shaded also, during the hottest part of the day; syringing them freely morning and afternoon, leaving a small amount of ventilation throughout the night. Manure-water, varied by an occasional application of clear soot-water, may be afforded plants well rooted, but not recently repotted.

Codiaeums (Crotons).—Brightly coloured shoots should now be plentiful on old plants which were beheaded some time ago, and if these are made into cuttings and inserted singly in thumb-pots and placed in a strong moist heat, closely shaded from the sun, to strike, useful plants fit for table decorations will be available in the autumn and winter. *Codiaeums* should, as cuttings, not be allowed to flag, and should be kept erect by securing them to small sticks, and be kept close under a bell-glass or hand-glass covering several cutting-pots. The bottom-heat applied should not be less than 85°, and the soil with which the pots are filled should consist of loam ¾, sharp sand ¼, with a surfacing of clean sand. Any plants which appear to need repotting in order to keep them growing throughout the winter, may now receive attention. *Codiaeums* should be placed close to the light, fully exposed to the sun, in order to bring out the brightest tints the leaves are capable of. The syringe should be freely used three or four times a day in hot weather. The plants must be grown hot and moist, and batches of cuttings of *Oplismenus Burmanni* (*Panicum*) *variegatum* may be struck. They come in useful for many varied purposes.

Chinese Primulas.—Successional plants may be repotted directly they have filled their pots with roots; and earlier batches, if growing freely, may receive weak manure-water on alternate waterings. Plenty of air and light are needed by these plants, care being taken to shade them from direct sunshine, and to afford them ample space and a cool bottom on which to stand the pots.

Freessias.—Home-grown bulbs should be sorted, and the best of them potted to the number of ten to twelve together, in 5 or 6-inch pots; the weaker ones may be placed thickly together in boxes, and both be put into cold-frames until growth begins, when they should be removed to slightly less cool quarters, and eventually to gently force them into early flowering.

Pilea muscosa.—Cuttings of this plant may be struck in small pots for winter and spring decoration. The cuttings will strike readily in a close, warm frame.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Olearia Haasti.—We have in this New Zealand evergreen plant an ornamental evergreen flowering shrub of much usefulness when it becomes a dense mass of white flowers. As a front-row plant in shrubberies, or as a clump on the turf, its effect is striking. It is likewise unaffected by a moderate amount of shade, and is therefore fit for planting under trees, and its flowering is then not so abundant; but the foliage, which is small and neat, and of a dark-green tint, makes it a very desirable plant in such situations.

General Remarks.—Most of the bedding-plants being now at their best, notes should be made of desirable alterations and re-arrangements in colour and material another year. Doing this now will admit of the gardener making his propagating arrangements more in accordance with requirements than when these are of a haphazard nature. The same applies to the re-arrangement and replanting of shrubberies, and of young trees; attention being given more particularly to the harmony or the contrast of the various tints of the foliage, and the forms of the shrubs and trees. Notes may be taken of shrubs which it may be desirable to buy, and a day during the next few weeks may be profitably spent in looking over the stores of a good hardy plant nursery. Where in the shrubberies overcrowding of the shrubs has begun, the present season may be utilised in marking those which will have to be removed—a method that saves much time later on. Flower-beds and flower-borders, herbaceous or other, will demand, whilst the hot weather lasts, and failing thunderstorms, copious, if not frequent, applications of water; and where desirable, as, for instance, round Dahlias, Hollyhocks, Michaelmas Daisies, and other strong-growing plants, a mulch of manure hidden under a sprinkling of earth may be applied. Great neatness and cleanliness ought to prevail everywhere, and spent flowers, dead leaves, and seed-vessels should not be tolerated on any plant. Let attention be paid to those subjects that will be employed in the spring flower-beds, in order to have strong, well-rooted plants. In some cases the points of the leading shoots may be once pinched off, and this is particularly useful in giving bushiness to Wallflowers. Antirrhinums, *Alyssum maritimum*, and plants of like habit.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, AUG. 23 { Royal Horticultural Society's Committee.

SHOWS.

TUESDAY, AUG. 23 { Brighton and Sussex Horticultural Society's Show (2 days).

WEDNESDAY, AUG. 24 { Harpenden Horticultural Society's Show.

THURSDAY, AUG. 25 { Ayrshire Horticultural and Agricultural Society's Show, at Ayr.
Swansea Horticultural Show.
Boston Horticultural Show.
Ellesmere Floral and Horticultural Society's Exhibition.

FRIDAY, AUG. 26 { Royal Horticultural Society of Ireland, Exhibition.

SATURDAY, AUG. 27 { Worsley Horticultural Society's Show.

SALES.

MONDAY, AUG. 22 { Great Trade Sale of Dutch Bulbs, 3500 lots; also Roman Hyacinths, Daffodils, Snowdrops, Lillium candidum, &c., at Protheroe & Morris' Rooms.

THURSDAY, AUG. 25 { Great Trade Sale of Dutch Bulbs, 2000 lots; also over 200,000 Kentia and other Palm Seeds, at Protheroe & Morris' Rooms.

FRIDAY, AUG. 26 { Orchids, at Protheroe & Morris' Rooms, by order of Mr. F. Sander.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—61° 2'.

ACTUAL TEMPERATURES:—

LONDON.—August 17 (6 P.M.): Max., 77°; Min., 60°.

PROVINCES.—August 17 (6 P.M.): Max., 78°; London; Min., 57°, Shetland.

The National Co-operative Festival. THE "One and All" flower show will be held this year in the Centre Nave of the Crystal Palace.

It is intended more especially for the exhibition of flowers, fruit, and vegetables raised by "co-operators" and allotment-holders, and does a great work in promoting horticulture among the people. It will be opened for private view about 2 o'clock in the afternoon of Friday, the 19th. At half-past 3 there will be a gathering of members and friends in the Summer Dining Saloon, which is situated in the southern annexe in the approach from the Brighton Station to the Palace. Here the guests will be received by Earl GREY, K.G., accompanied by the Countess, and their daughter, Lady VICTORIA GREY. An address is expected from Earl GREY, who has taken a foremost part in pressing forward the most advanced and beneficial developments of the Co-operative movement. Years ago, when he was well known as Mr. ALBERT GREY, his article in the Royal Agricultural Society's *Journal*, detailing his co-operative agricultural experiments at Howick, excited the deepest interest. Since he returned from Rhodesia he has renewed his public efforts for Co-operation of the best type, and what he may say on the 19th and 20th at the Crystal Palace will be anticipated with much interest.

The "One and All" Flower Show will be opened by the Earl, accompanied by the Countess, and their daughter, the Lady VICTORIA GREY, who also gives a Challenge Shield to the Co-operative Choir to whom is

assigned the first place in the Choral Competitions. The Countess GREY also gives a Challenge Cup to the Co-operative Society that obtains the greatest number of first prizes. The Cup or Shield respectively becomes the property of the Society retaining possession for three successive years.

In addition, the Council of the Agricultural and Horticultural Association, Limited, gives a "Champion Gold Medal" to the most successful exhibitor, subject to a scale of points and rules prescribed. Over and above these medals and special awards, the Council of the Agricultural and Horticultural Association gives money prizes to the aggregate amount of £350.

By way of illustrating the extent of this show we may say that the two classes for Vegetable Marrows in this section comprise more than 50 entries in each class; there are over 175 entries for the four classes of Potatoes, the other entries of vegetables being in equally remarkable proportions. But in addition to the large entries for the commoner kinds of vegetables usually grown by workingmen, the entries in the classes for the choicer vegetables usually grown by well-to-do amateurs and professional gardeners, such as Tomatos, Celery, and Cucumbers, are remarkably well filled, and the interesting comparison between the produce of these simple amateurs and the better equipped gardeners of the second section of the show has by no means in previous exhibitions always been to the advantage of the latter.

The position attained by the "One and All" Flower Show as the leading annual event of its kind, not only in the United Kingdom but in the world, was well maintained last year when 34,695 visitors attended the show, which comprised over 4000 exhibits, extending nearly a mile in length. The show last year, owing to the Jubilee Exhibition occupying the centre of the Palace, was held in a gigantic tent on the great terrace in front of the Crystal Palace, and the vast dimensions of this canvas structure were very striking. This year the show will again be housed under the glass of the Palace, and from the entries already received it will probably occupy the whole length of the great building.

This Great National Co-operative Festival and "One and All" Flower Show hold the same relation to the Agricultural and Horticultural Association as the Royal Agricultural Show holds to the Royal Agricultural Society. It affords an annual opportunity of demonstrating some of the results of the year's work. An exhibition of thousands of specimens of flowers, fruit and vegetables, grown in all parts of the kingdom, under every sort and condition of soil, climate and treatment, by independent cultivators, each working in his own way, counts for much in public estimation, and cannot fail to be highly educational and useful.

Next week we shall give a general account of the show in its leading features. To attempt anything like a detailed report would be futile, from the vast number of similar exhibits, neither would it be desirable if we could do it. Horticulture is not the only attraction offered, for we learn that the great orchestra will be filled by at least 6000 choristers, and there will also be a collection of photographs of gardens. Indeed, every inducement is held out to spend a useful and a happy day.

PROUSTIA PYRIFOLIA.—Recently Mr. LYNCH, of the Cambridge Botanic Garden, sent us magnificent specimens of this Chilean Composite. Our

space is by no means adequate to do justice to the beauty of the plant. The plant belongs to the curious group of the Mutisiæ, in which the petals are distinctly three in number, instead of five united together, as in most Composites. The stems are downy, and provided with small spines. The leaves are ovate, rather thick, and finely serrulate, in some specimens deeply so. The flower-heads (fig. 36) are very numerous, densely crowded in terminal panicles, the flowers pale lilac, and the pappus deep rosy-lilac. The plant was originally described in the *Annales du Muséum (Paris)*, xix., t. 4, 1812, by A. P. DE CANDOLLE and is rather variable. The figure in the *Botanical Magazine*, t. 5489, by no means does it justice. It was introduced from Chile by Messrs. VEITCH.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, August 23, in the Drill Hall, James Street, Westminster, at 1.5 P.M. At 3 o'clock a lecture on "Perpetual Fruiting Strawberries" will be given by M. HENRY DE VILMORIN.

HUNTERCOMBE MANOR.—The August number of the *Pall Mall Magazine* contains an account of this Jacobean mansion, with some very beautiful illustrations of the garden, the description of which was so familiar to the readers of our columns some ten or more years ago. The quaint and original descriptions were so much appreciated that they were gathered together into a book, the very title of which is tempting, *Days and Hours in a Garden*. The article in the *Pall Mall Magazine* says of it, "In the season of Violets a stranger entering would say it is a Violet garden. A little later on, it is all Daffodils, with a sprinkling of angel's tears. Later still, a garden of Primroses, lit up with 'many-coloured Tulips bright.' Then it is flooded with the amber of Wallflowers or the scarlet of Anemones. All May it is a realm of Iris, supreme in rainbow hues of gold and lilac; while in 'Royal June' it is as a page from the Rose-garden of Sâdi." Whoso desires to know the genesis and the evolution of this garden should read the sympathetic article in the *Pall Mall Magazine*.

THE CURATOR'S NEW OFFICE AT KEW.—The new office for the Curator, just off Kew Green on the Richmond Road, has an historic interest, in having been the residence of AITON, the author of the *Hortus Kewensis*. The Garden Library and the residence of Mr. W. WATSON are in this building.

PUBLIC PARK, WIDNES.—The 1st prize of 35 guineas in the public competition for the best design for laying out the Appleton House Estate as a public park has been awarded to Messrs. BARRON & SON, Elvaston Nurseries, Borrowash. The area of the Park is about 36 acres, and in addition to the general plan, which contains a lake, cricket and recreation-grounds, lawn-tennis ground, bowling-green, gymnasium, &c., they also furnish three alternative plans for dealing with Appleton House and premises; also designs for entrances, gates, band-stands, shelters, fountain, &c.

ITALIAN NATIONAL CHRYSANTHEMUM SOCIETY.—We have just received the first number of this new Society's *Journal*, and it is interesting to notice how all these continental Chrysanthemum societies are issuing periodical publications, in which their work is officially recorded. The President of the Society is Mr. A. SCALARANDIS, gardener to the King of Italy, a somewhat recent but nevertheless successful Chrysanthemum grower, who has met with important recognition both in Belgium and in France. The secretary, Mr. PAOLO RADARLI, is also a cultivator of repute, and amongst the members who already muster 160, we find names of well-known authorities and admirers of various nationalities. The Italian National Chrysanthemum Society intends to hold a show at Milan next autumn, and with such adherents as the gentlemen already named, Mr. Briccoe-Ironsidee, Dr. Baragiola, M. Calvat, M. Cordonnier, M. Rozain-Boucharlat, and several others, there should be such a display at Milan as would justify the hope that a large accession to the list of member-ship will take place.

SPORT IN CARNATION.—Mr. HERRIN obligingly sends us a flower of a Clove Carnation, the secondary bud of which, proceeding from the same stalk, is of a pale rosy-lilac self colour. This is only a case of a little less colour than usual, but the why eludes us.

not dispute their verdict; we agree with it. But of all persons in the world few require to exercise, and few do exercise, more foresight than do gardeners. Who can tell what Messrs. VEITCH may have in store for us if they continue intercrossing, possibly some-

hood could be infused into these crassulas, and among the multitude of seedlings there are sure to be some more hardy than others. Meantime the flowers of the hybrid are curiously intermediate in colour, form, and size, between those of the parents. Crassula

FIG. 37.—*PROUSTIA PYRIFOLIA*, D.C.: FLOWERS PAPPUS; FLOWER-HEADS MAGN. 2 DIAM., AND POLLEN GRAINS 300 DIAM. COLOUR ROSY-LILAC. (SEE P. 142.)

HYBRID BETWEEN CRASSULA COCCINEA AND ROCHEA FALCATA.—It is quite possible that many may have considered the hybrid shown by Messrs. VEITCH & SONS on Tuesday in last week, as less attractive as a garden plant than either of its parents. We shall

thing better than anything we have yet seen in this way, and therefore hybridisers and crossers who are necessarily doomed to so many disappointments at first should be strenuously backed up by their brethren. It would be a good thing if a greater degree of hardi-

coccinea has elongated flowers, with narrow lanceolate sepals, rich carmine petals, and the stamens more or less in union with, or at any rate, closely appressed to, the petals. The flowers of *Rochea falcata* are not much more than half the size of the *Crassula*, crimson-

yellow, with short ovate ciliate sepals, and stamens alternate with the petals, and almost free at the base. In the hybrid the flowers are intermediate in size, the sepals are more like those of the *Rochea*, as also the arrangement of the stamens. The anthers are shrivelled, and contain little pollen.

LYONS HORTICULTURAL EXHIBITION.—The syndicate of Lyons nurserymen some time ago announced that, on the occasion of the International Horticultural Exhibition, to be held at Lyons on Sept. 1, a grand horticultural fête should also be held. In 1894 a similar fête was highly successful, and 400 nurserymen from all parts of Europe were gathered in the fine Monnier rooms. The fête this year is to be held in the same saloons, which are large and handsomely decorated; and among the attractions offered is one to which attention is particularly called. The syndicate has procured the portrait or photograph of almost every one of those not now living whose name is famous in horticultural circles, and these photographs, enlarged by photography, will be on view to all the visitors. In organising this fête the *Chambre Syndicale* is guided by a graceful idea. It desires to make known to the present generation of horticulturists the form and features of their predecessors to whom the present celebrated establishments owe their reputation, and who have created horticultural science as much by their labours as by their writings. M. PERNET-DUCHER, 114, Route Henrioux, Lyon-Monplaisir, is the secretary.

SWISS NATIONAL CHRYSANTHEMUM SOCIETY.—We have just received the rules of this newly-formed Society, together with a schedule of prizes for the exhibition to be held at Geneva next November. We gather that its scope is on somewhat similar lines to the national societies of France and Italy, which may be briefly summed up as follows:—To encourage and develop the culture of the Chrysanthemum by every means in its power. 1, By organising shows; 2, By awarding medals or subsidies; 3, By awarding Certificates of Merit to the best novelties exhibited; 4, By arranging conferences at shows; 5, By giving advice to other societies desirous of holding Chrysanthemum shows and preparing prize schedules; 6, By supplying information to members, whether in Switzerland or abroad; and 7, By assisting amateurs to make selections of the best varieties to grow. The annual subscription is 5 francs for ordinary members, and 10 francs for honorary members. There is also a grade of corresponding members, and those elected as such will be entitled to admission to the Society's shows, and to receive its publications. Early in every year a journal is to be published containing a report of the progress of the Society, and a balance-sheet. A catalogue of the best varieties exhibited during the previous autumn will also be given. Part of the journal will be reserved for the publication of articles on the cultivation of the Chrysanthemum. The show will not be an international one except so far as new seedlings are concerned, and in this class exhibits from English raisers will be warmly welcomed.

INTERVIEWS.—We copy the following relating to fruit culture from the columns of the *Cable*. Mr. THOMAS WILLISHER, a Sussex farmer, consented to be cross-examined as to his farming ventures, and this is what he says about fruit:—"You seem likely to have fine crops of Apples and Plums?" "The Apples promise fairly well. They are the most important fruit I grow. The two chief varieties are the Wellington and the Glory of Hants; but I also grow Stone's Apple, Warner's King, Winter Queening, and Northern Greening. As to price, if the crops are good, Apples are cheap; if not, you can get an increased price." "Have you any difficulty about a market?" "No, they are sold in Hastings and London." "What is your number of Apple trees?" "I have 1500 Apple trees, 1000 Gooseberry bushes, 1000 each of black and red Currant bushes, 1000 Plum and Damson trees, and 500 Nut trees, Filberts and Kentish Cobs." "Any Strawberries?" "Only sufficient for use; they do not grow well on my soil." "Which fruit do you find the most profitable?" "Black Currants; the price in the market is 15s. or

16s. a bushel. For red Currants, I only get 7s. or 8s." "Which Plums do you find the most productive?" "The Victoria; I practically confine myself to that sort. The price for Plums, as of Apples, depends upon the crops." "Have you had any training as a fruit-grower, Mr. WILLISHER?" "None whatever. I took to fruit-growing because of the fall of prices in 1880. It was essential to do something else than ordinary farming. I commenced with fruit in a very small way, and it has gradually crept on."

A NEW CHRYSANTHEMUM CATALOGUE.—Mr. O. DE MEULENAERE acts the part of recorder of all the new Chrysanthemums for his countrymen in Belgium, having already published several very exhaustive and descriptive lists of novelties in years gone by. His last labours in this direction have resulted in the publication under the auspices of the Royal Agricultural and Botanical Society of Ghent of a third supplement to his descriptive list of Chrysanthemums. This new publication contains the novelties from all sources for the years 1896-1898, with the usual accompaniment of raisers' names, dates, section, and description, so far as the same are capable of being ascertained. Altogether, the work runs into thirty-six pages, and forms a useful work of reference to those whom it concerns. The publisher is M. AD. HOST, of Ghent.

POTATOS.—The production of Potatoes within the old tubers is not of very infrequent occurrence. It has often been described and figured in these columns, and is treated of from a physiological and morphological point of view by Mr. RENDLE in the *Journal of Botany* for 1893. Mr. NEWSTEAD of the Chester Museum now sends us some examples of a different but similar nature. The new tubers in this case are not formed within the old tuber, and liberated by the cracking of the latter, but a mass of densely aggregated buds or shoots is produced, forming an entangled nest-like mass, representing, we presume, the old tuber in a very modified form. The constituent shoots do not greatly lengthen or dilate, with the exception of one which turns downwards and forms a tuber of the ordinary character, its food having been obtained from the other shoots.

PUBLICATIONS RECEIVED.—*The Orchid Review* for August, No. 68, vol. vi. — *Journal of the Society of Arts*, August 5 and August 12, containing Cantor Lectures on Sources of Commercial India Rubber, 1 and 2, by Dr. D. Morris. — *Bulletin of Miscellaneous Information*, Royal Gardens, Kew, July, contains: Diagnoses Africanae XI, Fiji India Rubber, San José Scale and Chilliies. — *A Year's Work on a Kentish Fruit Farm*, by a Practical Man (Maidstone, Geo. Bunyard & Co.). — *Bulletin of Miscellaneous Information*, Royal Botanic Gardens, Trinidad, July, contents: conspectus, Ferns and Fern-allies; Cyatheaceae: Alsophila, Hemitelia, Cyathea. — *Bulletins of the Botanical Department*, Jamaica, for February and for March. The former includes papers on Cocoa in Trinidad, Venezuela and Grenada; Rubber; Ceara Rubber; Wax Palms of the Andes; Oka of Peru; Coccidae, and Synoptical list of Ferns; the latter Bulletin: Agricultural Chemistry of Cocoa and Elementary Notes on Jamaica Plants. — *Annual Report on Government Gardens and Parks in Mysore*, 1896-97. "The year was one of steady progress, and the public gardens and parks maintained their attractiveness. But owing to the dry weather which prevailed during a part of the year, the water supply was affected to a large extent, the Mango and other fruit crops were mostly a failure, and the trees and plants also suffered, though not very seriously." — *Contributions to the Flora of Queensland*, by F. Manson Bailey. Botany (Fungi); extracted from the *Queensland Agricultural Journal*, vol. ii., Part 1. — *Queensland Agricultural Journal*, June, containing many papers and Notes on crops, dairy, poultry, forestry, and allied industries. — *Agricultural Journal*, Cape of Good Hope, July 7, dealing with agriculture, stock, entomology, &c. — *Agricultural Gazette of New South Wales*, May; with papers on the Growth of Gall-making Insects, Report on the 1898 Vintage, Bees, *Paspalum dilatatum*, San José Scale, and other subjects. —

The Periodical Cicada (C. septemdecem), by C. L. Marlatt (U.S. Department of Agriculture). — *Report of the Botanical Department of the State Agricultural College*, Michigan, by W. J. Beal. An interesting record. Among the principal studies undertaken in the year (ending June 30, 1897), was that of Mushrooms and Toadstools; of which "many tons of good food, as valuable as beefsteak, go to waste in this State, simply from a lack of knowledge to enable the farmer and others to distinguish the edible from the poisonous. — From the Experiment Station of the same College come also Bulletins:— 1, *Study of Beans and Peas before and after Sprouting*, W. J. Beal; 2, *Study of Wheat and Buckwheat before and after Sprouting*, W. J. Beal; 3, *Study of Seeds of Timothy and Red Clover before and after Sprouting*, W. J. Beal; and 4, *Observations on the Leaves of Clovers at Different Times of Day*, W. J. Beal. — *The Fern Bulletin*, July (Midsummer Number), edited by W. N. Clute. — *Proceedings of the Twenty-fifth Session of the American Pomological Society*, held September 1 and 2, 1897, Columbus, Ohio. — *Bulletin de la Société Botanique de France* (Paris), July. — *Revue Mensuelle de Bibliographie Scientifique* (Paris), August. — *Bollettino della R. Società Toscana di Orticultura*, Luglio, 1898. — *Verzeichniss der Mitglieder des Vereins zur Beförderung des Gartenbaues in den Preussischen Staaten*, 1891. — *Botanisches Centralblatt*, Nos. 30 to 31. — *Rheinische Gärten: Das Heidelberger Schloss und seine Gärten*, Von H. R. Jung and W. Schroder (Berlin). — *Die Alpen—Pflanzen in der Gartenkultur der Tiefländer*, Von Erich Wocke (Berlin). — *Ueber die Bedeutung und den Ursprung der Paracorolle der Narcisseen*, Von Ladislaus J. Celakovsky.

PLANT PORTRAITS.

CYPRIPEDIUM HYBRIDS, one between *C. Spicerianum* and *C. villosum*, and the other from *C. insignis*. *Wiener Illustrierte Garten Zeitung*, July.

HABENARIA BLEPHAROGLOTTIS, *Meehans' Monthly*, August.

IRIS AITCHISONI, *Garden*, August 6.

IRIS ENSATA, Thunberg, var. *PADULARIA*, Naudin. — A pretty rhizomatous Iris, the foliage of which is adapted for forage. *Garten Flora*, July 15.

PHLOX DIVARICATA (= CANADENSIS), *Moniteur d'Horticulture*, August 10.

STRAWBERRY PRINCESS CLEMENTINE. — This may be called a Royal Sovereign Strawberry, as it was raised in the private gardens of the King of the Belgians at Tervueren. It is a cross between Louis Vilmorin and Sharpless. It is early, rounded or wedge-shaped. *Bulletin d'Agriculture*, &c., July, 1898.

TRITOMA CROCAT, *Garden*, July 30.

LAW NOTES.

RE SAMUEL RYDER, JUN.

THE above-named debtor made an application for his discharge at the London Bankruptcy Court, before Mr. Registrar Linklater, on Thursday last. It appeared from the Official Receiver's report that the proofs actually admitted amounted to £3420 6s. 6d., and the assets, so far as they were not assigned to creditors, amounted to £2645 0s. 5d., according to the debtor's statement of affairs, but the trustee reported that they had only realised £503 4s. 9d. A first and final dividend of 1s. 5d. in the pound had been paid on proofs amounting to £3420 6s. 6d. The Official Receiver submitted that the debtor's failure was at least in part due to his taking over a struggling business in Manchester, which he, an auctioneer in London, was unable to properly supervise. The bankrupt's assets were not equal to 10s. in the pound on his unsecured liabilities.

Mr. Carrington submitted that it was a case in which the failure had been caused through no fault on the part of the debtor, but the Registrar suspended the discharge for two years, that being the minimum period allowed by the Act when 10s. in the pound is not paid to the creditors.

Re EDGAR HARRY LAWTON.

The public examination of this debtor was held at the London Bankruptcy Court on the 11th inst., before Mr. Registrar Linklater. The summary of accounts showed gross liabilities amounting to

187 6s., of which £1418 17s. 6d. was due to unsecured creditors. In April, 1896, he entered into agreement with another person, who had a nursery Brighton, for the purpose of growing Orchids. It was arranged that the profits were to be equally divided, but in the September following the stock, &c., was sold to a company, called the Brighton and Worthing Horticultural Co., Ltd., which was formed to take over the stock and another business at Worthing. The bankrupt received as consideration 1233 fully paid shares as vendor, and he had since acted as director of the company without remuneration. He alleged his failure to have been caused through bad debts, and the adverse result of an action brought against him by the petitioning creditor. He had kept the usual books of accounts. The partly secured creditors held shares as security against an advance. The debtor was eventually allowed to pass his examination.

ALLEGED NOXIOUS FUMES.

Messrs. Jefford v. Goodall & Son.—The plaintiff in this action, Charles Jefford, of High Street, Bracebridge, sued Messrs. Goodall & Son, of Bracebridge, at the last sitting of the Lincoln County Court, before his honour, Judge Shortt, to recover the sum of £5 12s. in respect of damage caused to Potatoes and fruit-trees by the fumes from the defendant's works. The evidence was to the effect that the plaintiff owned a garden at the side of the defendant's manufactory, and for some years he had complained of a nuisance that had arisen, owing to the manufacture of asphalt. On June 25, on going into his garden, he found that his crop of Potatoes, &c., had been seriously injured. Mr. T. Jackson, of Beaconsfield Nursery, said he had been a market-gardener for upwards of fifty years. He inspected the plaintiff's garden a short time ago, and found everything in splendid condition. Eventually his Honour found for the plaintiff for 17s. 6d., but allowed no costs.

WORK ON "FORESTRY."—ACTION FOR THE LOSS OF A MANUSCRIPT.

At Leeds Assizes, on August 11, Mr. Justice Day and a special jury heard the case of *Simpson v. Bain*. In this case the plaintiff was John Simpson, head forester to the Earl of Wharfedale, Wortley, near Sheffield, who brought an action to recover damages for the loss of manuscript intended for the publication of a book, from James Arthur Bain, bookseller and printer, of Sheffield. Mr. Tindal Atkinson, Q.C., and Mr. Ringwood were counsel for the plaintiff; Mr. Chas. Mellor appeared for the defendant.

In opening the case, Mr. Atkinson said that the manuscript contained original matter, which was written by the plaintiff, who had had very considerable experience in horticulture, and had taken great interest in the art of forestry, which was much better known and practised abroad than in England. The subject, however, had recently engaged the attention of persons who were interested in the development of waste lands, and the plaintiff had written articles in connection with it. The art of forestry was practised largely in Germany, and the Germans had produced books on the subject. Plaintiff thought the opportunity would be a good one to write an English book on the subject, and he commenced to compose one of from 250 to 300 pages.

Mr. Mellor at this point intimated that the question would only be one of damages.

Mr. Atkinson, continuing, said that the plaintiff took the MS. to the defendant to be type-written, and it had to be returned to him. After the plaintiff had finished the MS. he wrapped it in a brown-paper parcel, and put an elastic band round it. The parcel contained chapters 9, 10, and 11 of the work. Plaintiff took the parcel to Sheffield, and handed it to the defendant in the Wharfedale Hotel, impressing upon him to be very careful with it, as he had no other copy, and it could not be replaced. Defendant promised to take proper care of the MS., and to return it safely. The parcel also contained an original pen and ink sketch of a forest near Newry, in the North of Ireland.

The MS. contained about 31,000 words. On re-

turning home the plaintiff made a memorandum that he had handed the MS. to the defendant to be type-written. Plaintiff's case was that these three chapters contained the pith and essence of the book, and that in losing them he lost all record of what he had written. The MS. and the type-written copy were to be returned about Christmas, and as they did not turn up, the plaintiff saw the defendant early in January, and asked him if the MS. had been lost, to which he replied in the negative.

Defendant told the plaintiff that he had sent the MS. to the Remington type-writing people, who had been very busy, and it had not been returned. On January 20 plaintiff wired for the return of the MS., and on the following day received a reply stating that it had been lost.

Plaintiff wrote in answer expressing his regret, and stating that the loss was irreparable. His client not being able to make good the loss, was compelled to bring this action to recover damages. The jury would only be called upon to assess the pecuniary value of the MS., which was original, and

FIG. 38. GOOSEBERRY DISEASE (ÆCIDIIUM GROSSULARIÆ): AFFECTED LEAVES AND FRUIT. (NAT. SIZE.)

had cost time and money, coupled with long experience, to prepare. Plaintiff had had to go to Germany to obtain information for his book, and had thus been put to considerable expense. Under the circumstances, he asked the jury to give the plaintiff very substantial damages. £100 and costs awarded.

THE GOOSEBERRY FUNGUS. (ÆCIDIIUM GROSSULARIÆ.)

SEE FIG. 38.

FEW plant diseases have proved more perplexing to mycologists within recent years than the *Æcidium* of the Gooseberry, a well-known object on the leaves and fruit in many parts of Britain. And yet now that its life-history is known, it seems almost surprising that its various spore forms remained undetected for so long. In Dr. Plowright's *British Uredineæ and Ustilagineæ*, 1889, p. 263, *Æcidium grossulariæ* is ranked among "Imperfect forms, the full life-history of which is unknown." And at that time practically nothing was known concerning it, although various attempts had hitherto been made to solve its life-history. Three or four years later, how-

ever, Dr. Klebahn, of Hamburg, had the good fortune to discover the missing spore forms, and succeeded in demonstrating that *Æ. grossulariæ* was a heteroecious species. By experimental culture he proved that the uredospores and teleutospores occur on two species of sedges, viz., *Carex acuta*, L., and *C. Goodenovii*, Gay, and that the fungus was nearly allied to *Puccinia caricis*, Schum. The fungus was also renamed and designated *Puccinia Pringsheimiana*, Klebahn.

During a visit to the Lake District in December, 1895, a uredine was found by the writer on the withered leaves of *Carex acuta*, and submitted to Dr. Klebahn, who recognised it as his *Puccinia Pringsheimiana*, and who produced from the material the aecidiospores on *Ribes grossularia* during the following spring.

With a view of studying the life history of the fungus at home, a series of cultures were arranged in 1897, and for this purpose ten small Gooseberry bushes (thanks to W. H. Stansfield, of Southport) were established in my garden during the winter, together with several plants of the common Nettle (*Urtica dioica*). In the month of April fragments of *Carex acuta* bearing teleutospores of the fungus were obtained from the shore of Windermere lake. On May 3 these were in an active state of germination, and were applied to the leaves of two Gooseberry plants and several Nettle plants, and were covered with bell-glasses. The remaining plants were kept as check plants in an isolated position. Spermatophytes were evident on both Gooseberry plants on May 28, and on June 6 the aecidiospores made an appearance. No result followed on the Nettles, and all the control-plants remained free throughout the season. On June 17 ripe aecidiospores were applied to the leaves of *Carex glauca*, but without any result.

At this stage the experiments were unfortunately interrupted through a tour abroad. The experiments, however, have been continued during the present year, and a number of plants of *Carex hirta*, L., *C. leporina*, L., and *C. Goodenovii*, Gay, were established both in pots and in the garden for the purpose. One-half the plants of each kind were kept as control-plants, and on May 31 to June 3, aecidiospores of the fungus—kindly forwarded from Windermere by my friend, Mr. C. Crossland—were profusely applied to the three sedges, which were in a thoroughly healthy condition, and each plant was covered by a bell-glass for several days. The first indication of a result was on June 12, when two or three leaves of *Carex Goodenovii* were observed to be showing discoloured spots on the upper surface. The following day a sorus of uredospores made its appearance, and on June 18 and 20 uredospores were abundant on the upper surface of the leaves of *Carex Goodenovii*. Not the slightest result followed on either *Carex hirta* or *Carex leporina*, and all the control-plants have remained free to this date. Teleutospores were evident on July 5. The fungus spreads rapidly by means of its uredospores; for instance, on June 22 germinating uredospores were applied to the three species of *Carex* above mentioned, and on July 1 had reproduced uredospores on *Carex Goodenovii*, but without result on either *Carex hirta* or *C. leporina*. This latter experiment has been several times repeated with precisely the same results. At the present time my *Carex Goodenovii* is invaded by a promising crop of teleutospores, and it is hoped next year to test the effect of the fungus on other species of *Ribes*. Of the many experiments with parasitic fungi few have given more pleasure to the writer than the working out of Dr. Klebahn's *Puccinia Pringsheimiana*. Henry T. Soppitt, 12, Glen View, Halifax, Yorks.

HOME CORRESPONDENCE.

WALNUTS: SHOWING HOW CUSTOM IN TRADE ALTERS.—In the fifties, the supply of Walnuts to Covent Garden Market came chiefly from abroad and many more came in the green shells than now. They arrived in upright, brown-rodded, round baskets with lid, and two handles at the top, and these were

called half-tun baskets—why, I do not know, as they held about 1 bushel; and when the Nuts were ripe enough, they would be shelled ready for sale by the peck or otherwise. As the season advanced, the Walnuts would at times come in a very dirty, black state, owing to the decay of the outer shell; and after removing the outer shell, it was necessary to cleanse them in a tub of water in which chloride of lime was mixed, and wash them with a stiff birch-broom or heather. On being taken out of the water they were allowed to drain dry before bleaching, and that was accomplished in what was called a colouring-tub, an upright vessel, made for the purpose, of nearly straight staves, tapering slightly upward, about 5 feet high, with a false wicker concave bottom fitted about 12 inches from the bottom of the tub, where a sort of pigeon hole was made in which to put the sulphur, for holding which a brown earthen pipkin was used; the sulphur being lit and placed within the tub under the Nuts, and a sack laid over the top. The sulphur was allowed to burn itself out before the sack was removed. The Nuts showed a marked improvement in appearance, and were then ready for sale. That was the custom with the merchants who dealt largely in them. The tubs would stand outside in front of the dealers' premises, and at times numbers of them would be in use at one and the same time, throwing off fumes to such an extent that it became a great nuisance to persons having business in the market, and complaints were made to the magistrate at Bow Street, and printed notices were served by the Market Superintendent on the tenants ordering the practice to be discontinued, which had the desired effect. Some of the market tenants then had kilns built in their cellars, with a pipe connecting with a flue to carry off the fumes. All that is now changed, and I doubt if any kilns now remain; and if anyone saw such a tub as described, they might wonder for what purpose it could be. Walnuts seldom come in the green shell; but very large quantities in bags, well sorted and well packed, in a uniform handy parcel, which command ready sales. T. P.

A ROYAL HORTICULTURAL SOCIETY PEAS TRIAL.—Mr. Dean suggests that any considerable Peas trial conducted by the Royal Horticultural Society, not only to test the merits of varieties innumerable, but also to determine which to recommend for farther culture, and which to advise for removal from the lists, should be made out in the breezy country air. That is most certainly an essential, not only because the soil at Chiswick is too light and porous, and readily dried, but also because the air there is too confined and superheated in warm weather. Much more room than can be there furnished is also needed. A good trial of diverse varieties, in rows of moderate length, would need fully an acre of ground, and one of diverse stocks of varieties would need 4 acres at least. Still, it is more good stocks of distinct varieties that it is desirable to test than diverse seedsmen's stocks of them. Certainly, it would be easy to obtain 200 that are claimed to be distinct. Such a trial would have to be on good Pea soil, not too remote from London. Possibly Mr. W. Poupart of Twickenham would be willing for due consideration to place an acre of his fine open land at the Council's disposal for the purpose. I had a very successful trial of twenty varieties on light sandy ground at Richmond, but at Twickenham the site is more open, and the ground more holding and deep. But were such a trial conducted, and a choice selection of the very best made and published, would seedsmen be prepared to act upon it? There would have to be determined beforehand by the selection committee certain conditions on which the selection should be based—hardiness, precocity, productiveness of pod and Pea, colour, sweetness, flavour, easiness to shell, and general taking appearance; also excellence for late cropping. Dwarfs, mediums, and tall, would have to be placed in their respective sections. Certainly a great and real trial of this nature should be full of exceeding interest, and have great value. A. D.

ROYAL SOVEREIGN STRAWBERRY.—It has been this season a subject of common complaint against this Strawberry that because of its long leaf-stalks the foliage overhangs the fruit as it ripens, excludes light and air, and thus causes it to rapidly decay. When looking over the breadth in the gardens at Ruxley Lodge, Esher, recently, Mr. Miller referred to this complaint, and said when he found the ripe fruits suffering from damp he had some long straight sticks pushed in under the stems, and then lifting them a few inches and fixing them on the

props, so brought the fruit up to the light and air that decay was at once checked. Could not this plan be adopted earlier, using either Bean rods or long Bamboo rods, a couple of wire ties being attached to each, so that they could be lifted from the ground a few inches, and be suspended to other rods, running along 12 inches above the plants? That would bring the fruits up to the light, would keep them clean and dry, and would also place them out of the reach of vermin. A. D.

FLORIDA VELVET BEAN.—The Director of the Florida Agricultural Experiment Station, in his *Bulletin* 43 for Sept., 1897, on p. 637, gives the name of this Bean as above instead of *Mucuna pruriens*, as given in a recent issue of the *Gardeners' Chronicle*, and speaks of it as follows:—"Another legume that has lately come into prominence, and that promises to be a valuable agent in reclaiming the worn-out soils of Florida, and also a most excellent food for stock, is the Velvet Bean. During the past two years this station has been conducting experiments with this plant, and the results have been very promising. It is now known that the plant will grow luxuriantly all over the State, and stock of all kinds are exceedingly fond of it. The practical results of feeding have been all that could be desired, and we believe it to be equal to the best legumes in feeding value. In the near future it is proposed to make a complete chemical study of this plant in different stages of growth, and to publish the information for the benefit of farmers. There is scarcely a doubt that it will yet play an important part, not only in solving the forage problem in Florida, but in improving both the mechanical condition and productive capacity of our thin sandy lands, by increasing their stores of both nitrogen and humus, and exerting various other beneficial effects." The present retail price of the Beans is about 2½ dols. per bushel. W. E. G.

WHAT IS HABENARIA CONOPSEA?—In answer to this editorial question, which is asked on p. 126, may I be allowed to say that I do my best loyally to follow the most recent botanical authority for the names of the plants I mention, and have been told at Kew to believe in *Index Kewensis*, and the *Kew Hand-List of Hardy Plants*? Where these two agree the name is to be considered final, but where they differ preference is to be given to the last as more recent. The two works agree in giving to the native plant generally known as the Gnat, or fragrant Orchis, the botanical name of *Habenaria conopsea*. Fifty years ago *Gymnadenia* was its prevalent generic name, and since that time British and continental botanists seem to have held various opinions about its right to each name. With regard to the hybrid in question I have leave to say that the finder of the three specimens I mentioned is Col. George Dixon, of Astle Hall, near Chelford, and that if any botanist should next year be visiting the neighbourhood of Arisaig, Col. Dixon will instruct him where to look for it. The spot is near a house called Garrowmore, about three miles to the north of Arisaig, very near the line of railway now being made from Fort William to Maleg, which will be open in two or three years, and give better access to that wild and beautiful district. C. Wolley Dod, Llandudno.

A NEW BRITISH ORCHID.—In connection with the notes on the above at pp. 61 and 126, it will be interesting to reproduce an article by Mr. Rolfe which appeared at p. 328 of the last number of the *Orchid Review*. *Habenaria conopsea*, it will appear, is another name for the familiar *Gymnadenia conopsea*, and owes its origin to the latter genus having, in the *Genera Plantarum*, been merged in *Habenaria*. Mr. Rolfe, however, thinks the two sufficiently distinct, and in forwarding the following note, he remarks that it is the third natural hybrid Orchid recognised in Great Britain within recent years. The note is as follows:—

GYMNADENIA × CONOPSEO-ALBIDA.

Another very interesting addition to the British Orchid-flora has just come to light. A note by C. Wolley Dod, in the *Gardeners' Chronicle* for July 23 (p. 61), states that about the end of June, a friend on a visit in the Highlands sent him for identification an Orchid which he found near Arisaig, in Inverness-shire, which he recognised as resembling *Habenaria conopsea*, but differing from it, especially in the spur, which was much shorter. Not knowing it, he sent it to his son, Captain Wolley Dod, who is well up in the native flora. It was new to him, though he doubtfully, and from description only, referred it to *H. odoratissima*; a native of the mountains of France and Germany; he also asked if more specimens could be obtained. With some difficulty, as the flowering-season was then over, two more were found. These were brought by Captain Wolley Dod to Kew (where one is now preserved), and a comparison with authentic specimens soon showed that they did not belong to *H.* (or really *Gymnadenia*) *odoratissima*. He had also suspected that the plant might be a natural hybrid between *Gymnadenia conopsea*

and *G. albida*, as it was found associated with these two species and *Orchis maculata*, and he left me to work the question out. These two species are very dissimilar; *G. albida* has white flowers, an equally tricuspidate lip, and a short, swollen and obtuse spur, not equalling the lip, while *G. conopsea* has rose-purple flowers, an unequally trilobed lip, and a filiform, acute spur many times longer than the lip. The hybrid—acut spur evidently is—has rose-purple flowers, but the spur is stout, and only twice as long as the lip, which latter organ is about intermediate in shape; the leaves also are intermediate in shape, but the spike closely resembles that of *G. albida*. Such a hybrid has already been recorded by Hegelmaier, in 1864, under the name of *Gymnadenia conopsea* × *albida* (*Estr. Bot. Zeitschr.*, 1864, pp. 102-104), and by Kerner, a year later, as *G. × Schweinfurthii* (*Verhandl. Zool. Bot. Gesellsch. in Wien*, xv., p. 213, t. 5, fig. 15-16). It was found by Dr. Hegelmaier, in July, 1863, in the Austrian Alps, and the Scotch plant is evidently substantially identical. The discovery is very interesting, and it seems probable that it might be found in other localities, where the two species occur intermixed, if searched for. The Scotch locality is described as within half-a-mile of the sea, and not more than 100 feet above it. R. A. Rolfe.

SCARCITY OF WASPS.—Several gardeners have remarked to me recently of the scarcity of wasps so far. That is rather a matter for congratulation, especially that Plums and Pears, the fruits they specially favour, are rather scarce. Still, even these insect pests may but be partaking of the general character of the season, and be only late. A week or two will reveal them or their absence. If really scarce, the cause may be found in the exceeding coldness of the usual season for the appearance of the hibernated queens. I noticed in a country show recently, where prizes were offered for the largest number of queen wasps to be delivered to the secretary by an early date, that not more than about forty were sent. That is few compared with what is sometimes seen, when prizes for their destruction are offered. A. D.

SEEDLING FUCHSIA.—I send you specimens of one of my seedling Fuchsias, which is somewhat distinct from many that have come under my notice, from the fact that the style and stigma are almost pure white, which renders the flowers, produced very profusely, very interesting and conspicuous, especially if arranged amongst plants with a suitable background. The habit is good, and the growth extraordinarily strong, scarcely requiring anything to support it in position. In this respect I have never seen its equal. The principal and chief characteristic is this, combined with the white style and stigma, and the extraordinary texture of the sepals. *G. Fry*, F.R.H.S., Lewisham, S.E. [The flowers sent by Mr. Fry are of a pretty Turk's-cap shape, with red sepals, and purple corolla, with organs as he describes them. Ed.]

BLIND STRAWBERRY PLANTS.—This is undoubtedly a very important subject to all Strawberry growers. In your last issue of the *Gardeners' Chronicle*, J. Barnard asks for information as to the cause of blindness in these plants; whilst on the previous page "D. T. F." gives some valuable information on the subject. So far, then, I think we can tabulate the causes of blindness as follows:—1, Excessive vigour caused by a superabundance of nitrogenous foods; 2, The destruction of the blossoms by frost and sudden changes in the climatic conditions; 3, Excessive drought or dryness; and 4, The destruction of the roots by digging between the plants. Plants may also become barren or partially so by imperfect fertilisation. The practice of propagating from blind plants is not to be recommended. A series of experiments on this important subject would, no doubt, yield valuable information to that already obtained; and would add greater force to the theories already propounded. Are Strawberries protandrous or protogynous? If either, would it not be better to grow several varieties in immediate proximity to each other for fertilisation? S. H.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

AUGUST 9.—Present: Dr. M. T. Masters, in the chair; Mr. Bennet-Poë, Rev. W. Wilks, Mr. Marshall, Rev. Prof. Henslow, Hon. Sec., and the following visitors:—Prof. J. Bailey, of the University, Ithaca, N.Y.; Herr J. K. Budde, Curator of the Botanical Gardens, Utrecht; and Mr. Gordon.

Tomato with Red and Yellow Fruit.—Mr. J. McLean, Luttrellstown, Clonsilla, Co. Dublin, sent some golden-yellow fruit, with the following observations:—"The plant which produced them is one out of 145 Frogmore (red) selected. The first cluster produced the true red sort, but on the same plant three trusses consisted of yellow fruit, as sent." Prof.

Bailey observed that he had raised yellow-fruited Tomatos from the seed of red-fruited plants, but had not seen a case resembling the present one, in America; though he had known a cutting of a red-fruited sort to bear yellow fruit, as well as a red fruit being striped with yellow.

Scolopendrium var.—Mr. Marshall exhibited a plant raised from a frond, which was remarkable for its great size, being quite a foot broad, and terminated with numerous barren subdivisions. It was buried, leaving the subdivisions only exposed. Roots were formed at the bases of the incisions, so that five plants were raised. Of these two repeated the remarkable fronds, two reverted to the wild form, and the one exhibited bore four fronds with digitate extremities, one frond with a crisped margin (*var. crispum*), one being flat as in the wild state. The first two will, it is hoped, establish a new race.

Tomatos with Supernumerary Carpels.—Dr. Bonavia sent two specimens; one, consisting of four carpels, which, instead of being coherent to form a single fruit, were only united at the base, and therefore nearly apocarpous. The other had several extra carpels issuing out of the centre above. These formed a whorl of carpels, in addition to the normal series. It resembled the "Mellarose Orange" in this respect.

Poppy-head, with Pistillody of the Stamens.—Herr J. K. Budde exhibited a fruit of *Papaver somniferum* with a complete whorl of miniature carpels around the base; these being metamorphosed stamens. This peculiarity is well known; but it is interesting to hear that Prof. de Vries has succeeded in fixing it by selection, so that this monstrosity now comes true by seed. A similar phenomenon is common among Wallflowers. With reference to hereditary monstrosities, Mr. Bailey observed that a species of *Echinops*, with a fasciated and twisted stem, as also the spirally-twisted variety of the Fuller's Teazle, can be now perpetuated by seed. Prof. Henslow inquired if the Weeping Ash was known to be perpetuated by seed, as of thousands of seedlings in his garden at Ealing, none ever showed any inclination to weep; though the late Prof. J. S. Henslow found a slight tendency to weep to exist for two or three years in his experiments at Hitcham; but the plants grew erect afterwards. Mr. Wilks observed, on the other hand, that a young tree a few years old at Shirley had begun to show a tendency to weep.

Crassulaceous Hybrid.—Mr. Veitch sent trusses of flowers of a new hybrid, raised by Mr. Seden, between *Kalosanthes coccinea* (female) and *Rochea falcata* (male). The flowers of the hybrid were small, as in the female parent, but the colour approached that of the male. In many points it was intermediate between the two parents.

Cattleya granulosa, Dimerous.—Dr. Masters exhibited, on the part of Mr. Cobb, a blossom with its parts in twos, there being two large sepals, two lips, &c.—not a rare phenomenon in trimerous flowers, as *Iris*, &c.

Hybrid Nymphæas.—Dr. Masters exhibited several kinds, as shown in the Drill Hall by Mr. Hudson, Mr. Mitford, C.B., and others, with the purpose of calling attention to the different arrangements and numbers of the air-canals in the stems of the flowers and in the petioles. He observed that the *Nymphæas* could be grouped by means of them.

Plymouth Strawberry.—A specimen was received from Mr. J. Arrowsmith, of Bank Road, Glazebrook, Manchester. It is a monstrous condition of the ordinary fruit, in which some of the achenes are replaced by leaves, as in the well-known Alpine Strawberry, of which the present case is a variety. It was described by Ray, who gave the name, having received it from Plymouth. It resembles the green Rose, in thus having its floral organs more or less in a state of reversion to leaves.

Strawberry Plants Defective.—Some plants were received from Mr. J. Lyne, of The Gardens, Foxbury, Chislehurst, in which the crowns were generally blind. The variety is Royal Sovereign. Mr. Lyne writes:—"Last autumn we planted a bed of last season's runners, with the object of getting early runners this year. They grew well, and made a fine lot of early runners. All trusses of bloom were picked off the parent plants as soon as they appeared. The runners were layered, four in a 6-inch pot, and all rooted well; but last week, when transferring them into single pots, we found about half were blind, the crowns being brown within. A healthy plant would be often growing in the same pot with defective ones." Perhaps some grower of Strawberries may have had a similar experience, and can throw some light on the mystery. Sections of the crown-buds revealed no visible fungi nor insects, but the scales were turning brown from the exterior part inwards, apparently suggestive of an external source of the mischief.

Floral Committee at Chiswick.

AUGUST 16.—The thunderstorm early in the morning had refreshed the plants, which had suffered from the heat and lack of moisture. The *Violas* were inspected, but only one was selected for three marks, namely, Bronze Queen (Forbes), bronzy crimson with fiery gold centre, a somewhat striking variety.

Awards of Merit were made to *Canna William Marshall*, a magnificent variety, showing an advance in form, the large broad petals giving the flowers the appearance of a red and gold-coloured *Cattleya*, the ground is yellow, much spotted with orange-red, and with a yellow margin. This is a seedling raised at the gardens of the Society, and named by the Floral Committee; also to *Canna Stadtrath Heidenreich*, a deep bright vermillion self, of very fine character, with bold dark foliage. Three marks were awarded to *Comte de Bouchard*,

yellow, spotted with bright crimson, fine in quality; the same to Countess de Vartoux Florence, yellow, heavily spotted with bright orange-red; and an Award of Merit was made to a fine variety named *Partenope*, rich orange-brown, the petals feathered on the edges with crimson, dwarf, and very free.

Three marks were awarded also to a very fine strain of the double Indian Pink, *Dianthus chinensis*, containing many handsomely marked varieties, well deserving of a place in the garden; and also to *Dianthus lacinatus*, single-flowered, mixed; composed of many pretty varieties, all of large size with fantastically-cut margins. All the Indian Pinks appear to be good dry-weather plants. Both the foregoing were from Messrs. WATKINS & SIMPSON.

MEETING OF THE GHENT CHAMBRE SYNDICALE.

At the last monthly meeting of the *Chambre Syndicale des Horticulteurs Belges*, and of the *Société Royale d'Agriculture et de Botanique*, the following Awards were made:—

Certificates of Merit for *Odontoglossum Adriæ* (*crispum* × *Hunnewellianum*), *var. M. Verdonck*, from M. Maurice Verdonck; and *Cyrtostachis Rendah*, from M. L. De Smet-Duvivier (*à l'unanimité*). Honourable mention for cultivation was allotted to *Aralia Kerchoviana*; and Honourable Mention also for *Selaginella prœflora*, from M. De Smet-Duvivier.

ISLE OF WIGHT.

AUGUST 9.—The Whippenam Cottage Garden Society held their first exhibition on the above date in the picturesque Rectory Gardens which adjoin Whippenam Church.

FIG. 39.—ODONTOGLOSSUM CRISPUM LEHMANNI (SCHOFIELD'S VARIETY).

(See "Orchid Committee Report," p. 123, ante.)

The exhibition was favoured with the presence of the Queen and Princess Henry of Battenberg (Governor of the Island), Princess Victoria of Schleswig-Holstein, and the Duke and Duchess of Connaught. The exhibits were numerous and of excellent quality, considering the dry season. Her Majesty evinced much interest and pleasure in the garden products of her parishioners; and there is no doubt but this exhibition will be a great stimulus to the development of cottage gardening in the Royal parish. School gardening is taught at Whippenam Schools by the head mistress (Miss Thomas) with great success. S. H.

WARGRAVE AND DISTRICT GARDENERS' ASSOCIATION.

AUGUST 9.—A monthly meeting of the above Association was held on Tuesday in the Parish-room, Mr. W. POPE presiding.

It was decided to ask him to do so at the next meeting. Messrs. W. POPE, F. POPE, and W. GREENAWAY, were unanimously appointed judges for the ensuing month. The Certificate of the Society was presented to Mr. W. POPE for his exhibit of a group of *Streptocarpus*. A splendid lot of *Caladiums*, including *Comte de Germainy*, *Sirius*, *Elsie*, *Comtesse de Brosse*, *candidum*, *John R. Box*, *Princess Teck*, *argyrites*, &c., were staged for exhibition by the chairman, who also showed two dishes of Tomatos, red and yellow, perfect in form and colour. A discussion took place on *Caladiums* and garden matters generally, in place of the usual paper.

SEVENOAKS HORTICULTURAL.

AUGUST 10.—No more delightful place could be selected for holding a flower show than Knole Park, in which Lord Sackville had kindly allowed the show to be held. It is close to the town, is delightfully undulated, and contains magnificent Oaks and Beeches. The day was windy, and the heavy clouds threatened rain, but not any fell, and there was a good company.

Groups.—One large tent was filled with these and specimen plants. There were groups of flowering and foliage plants arranged in a given space, and these were placed along the wall of the tent, on one side, and alternately there was a group of Ferns of equal size, and this mingling materially helped the effect. Mr. A. HATTON, gr. to Mrs. SWANZY, The Quarry, had the best group of Ferns, a very effective one; Mr. Hough, gr. to Mr. LOMBARDE, Beechmont, was 2nd; both were well arranged, and the Ferns in excellent condition. The best arranged group of plants came from Mr. C. SUTTON, gr. at Chevening. This had Palms, *Gloriosa superba*, *Campanula pyramidalis*, *Begonia corallina*, *Carnations*, *Codæums*, Ferns, &c., admirably disposed; Mr. G. FARNELL, gr., Firlawn, Tonbridge, was a good and close 2nd.

The best collection of six exotic flowering-plants came from Mr. A. GIBSON, gr. to T. A. BURNABY-ATKINS, Esq., Halstead Place, who had very fine examples of *Dipladenia Brearleyana*, and *D. insignis*, both grandly grown and bloomed; *Clerodendron Balfourianum*, *Ixora Dixiana*, and *I. Fraseri*, and *Anthurium Scherzerianum*; Mr. A. HATTON was 2nd, with fine examples of *Allamanda Hendersoniana*, *A. nobilis*, *Gloriosa superba*, *Ixora Fraseri*, &c. Mr. HATTON had the best six specimen foliage plants, staging *Alocasia Thibautiana*, a very fine character; *Latania borbonica*, *Marattia salicifolia*, a fine example; *Cibotium princeps*, *Anthurium Veitchianum* and *A. crystallinum*. Mr. J. TALMAGE, gr. to Miss HODGSON, Hereford, was 1st with four very fine specimen *Caladiums*, and there were also good bushes of *Coleus* and specimens of Hardy Ferns. Mr. J. TALMAGE had the best six varieties; Mr. C. Noble, gr. to Miss AUSTIN, Sevenoaks, coming 2nd.

The best specimen flowering plant was *Dipladenia boliviana*, a very fine large-flowered variety, from Mr. C. SUTTON, Mr. GIBSON being 2nd with *Anthurium Scherzerianum*. The best specimen foliage plant was *Alocasia Thibautiana*, from Mr. HATTON; Mr. GIBSON was 2nd, with *Cycas revoluta*.

Fuchsias were nicely-grown bush specimens. The best six were from Mr. G. COOPER, gr. to H. FOSTER, Esq., Hippingham; Mr. H. HEATH, gr. to Mrs. PETLEY, Riverhead, was 2nd. Mr. TALMAGE had the best four specimen *Begonias*; Mr. W. ADAMS, gr. to J. DIXON, Esq., was 2nd.

Zonal Pelargoniums and table plants were also shown. There were classes for plants shown by gardeners in smaller places, and by amateurs, all of which were pretty well filled.

In cut flowers, Mr. C. SUTTON had the best twelve *Roses*. Mr. SEALE, Vine Nursery, Sevenoaks, had the best twenty-four *Dahlias*. The best twelve came from Mr. A. PARKER, Ivy Hatch. *Cactus* and single varieties were also shown. The best collection of twelve bunches of stove and greenhouse cut flowers came from Mr. GIBSON. There was a class also for bunches of hardy flowers. Mr. E. HODGSON, gr. to Miss MORPHEW, Sevenoaks, had the best six bunches of border *Carnations*. There were classes for cut flowers shown by amateurs and others.

Fruit was also invited, the leading class being for six dishes, but owing to the names of the exhibitors not having been supplied, we cannot give them. Some very good Black *Hamburg Grapes* were staged, and Mr. HOUGH had two good bunches of *Muscat of Alexandria*. *Peaches*, *Nectarines*, *Plums*, *Apples*, *Cherries*, &c., were also staged.

The best collection of *Grapes* in three varieties came from Mr. T. OSMAN, gr., Ottershaw Park, who had *Alicante*, *Black Hamburg*, and *Chasselas Napoleon*, one bunch of each; Mr. W. HOUGH was 2nd.

In the way of table decorations, the best-arranged dinner-table was set up by Mr. S. COOK, The Gardens, Rosefield, done in good taste; Mr. W. A. SEARING was 2nd. The latter had the best centre-piece; and Miss ETHEL COOK the best bouquet. Mrs. SEALE had the best-arranged basket of flowers.

Vegetables.—The class for a collection of nine varieties of vegetables brought a good competition, and it was a class that seemed to have aroused a good deal of local interest. There were other classes also for vegetables.

Miscellaneous.—A collection was sent by Messrs. VEITCH & SONS, of Chelsea, making a very fine and imposing group of plants; Messrs. J. FRED & SONS, Lower Norwood, had a magnificent collection of *Caladiums*; and Mr. SEALE a large and finely arranged bank of plants and cut flowers in great variety; Messrs. CUTBUSH & SON, Highgate, had a fine group of plants; Messrs. H. CANNELL & SON, Swanley, a striking collection of *Cannas*; Mr. J. R. BOX, Croydon, cut flowers; and other smaller exhibits were also staged.

BISHOP'S STORTFORD.

AUGUST 10.—This Society, which dates back to 1838, held its annual show on a most extensive scale in the grounds of John Parker, Esq., J.P., The Grange, on the above date.

The fruit and the vegetable classes brought together some first-class produce. *Grapes*, *Peaches*, and *Nectarines* were all first-class. Like the Shrewsbury show, that at Bishop's Stortford does not depend upon horticultural productions merely, but includes classes for honey, corn, roots, and poultry. This in a purely agricultural district, is most commendable, and should be more frequently adopted.

It is well worthy of remark that the present hon. secretary, Mr. W. Smith, has held that post, which is no sinecure, for the past twenty-eight years, and his interest in the welfare of the Society appears to increase rather than diminish as the years go by.

Plants.—In the group class alluded to above, Mr. G. Barker, gr. to H. A. BLYTH, Esq., was placed 1st with a tasteful arrangement, well broken up and diversified, being more in the way of the groups seen staged at such places as Shrewsbury, but a little lacking in colour at the back; Mr. J. Richardson, gr. to Sir J. BLYTH, was a good 2nd; he, on the other hand, had rather too much colour, whilst his arrangement was of the old-fashioned form and outline.

The best six stove and greenhouse plants were staged by Mr. T. Lodge, gr. to Mrs. MENET, being followed closely by Mr. G. Beech, gr. to J. BARKER, Esq.

The 1st prize for six foliage plants was awarded to Mr. J. RICHARDSON, who had some well-grown examples of Palms, Mr. G. BARKER, who came 2nd, having a uniformly healthy lot of plants.

Exotic Ferns, which were excellent, were shown best by Mr. B. Calvert, gr. to Col. ARCHER HOUBLON, Mr. Clarke, gr. to C. GOLD, Esq., M.P., pressing close for the 2nd prize, both exhibitors showing several well-grown Adiantums.

The tuberous Begonias were a feature of the show, the plants well-flowered, and of up-to-date varieties. The best group came from Mr. W. Pavitt, gr. to W. SMITH, Esq.; this was comprised entirely of well-grown and freely-flowered plants, the double varieties being conspicuous by their high-class quality. Mr. E. HARRIS, gr. to A. TAYLER, Esq., was a close second, some of whose plants were larger, and many smaller, than the preceding exhibitors, being scarcely so well flowered.

Tuberous Begonias in hanging baskets were shown best by the aforementioned, but the prizes were reversed. And in the classes for six double and six single varieties, Mr. E. HARRIS was likewise 1st.

Cut Flowers.—These constituted a great attraction in the show. Messrs. PAUL & SON, Cheshunt, were 1st for twenty-four bunches of hardy perennials, or bulbous flowers, staging in their well-known style; Mr. H. BRACE, gr. to H. A. HARE, Esq., came in 2nd with a good display.

The best Dahlias were staged by Mr. MORTIMER, of Farnham, in the open classes, the local exhibitors not being so well up in the newer kinds.

The 1st prize in the class for dinner-table decorations was awarded to Miss STREET, of Bishop's Stortford, whose arrangement was very tastefully done, pink and white predominating; Mrs. F. KNIGHT, of Saffron Walden, was a good 2nd in this class of twenty-three competitors.

The best decorated fire-place and mantel board was that shown by Mrs. C. JOSCELYNE; it was very light and tastefully done, showing the touch of the artist. Mr. T. LODGE had the best exhibit of this kind open to gardeners only, but he used more material than that of the previous prize-winner. It is worth noting that in all of these decorative classes the frequent mistake of depending largely upon exotic flowers, as Orchids, &c., was not all evident.

Fruit Classes.—For eight dishes of fruit, Mr. A. Handscomb, gr. to R. C. HALDANE, Esq., was placed 1st, the Grapes, both black and white, being excellent; also the Peaches and Nectarines. Mr. B. CALVERT, gr. to Col. ARCHER HOUBLON, followed in this class.

The best black and the best white Grapes, both first-class, were shown by Mr. E. Skelton, gr. to J. BARKER, Esq., the Graperies; Mr. CALVERT in the black class, and Mr. J. RICHARDSON in the white, were each 2nd respectively.

The last-named exhibitor had the best dish of Peaches, fine fruits from under glass. H.

HASTINGS HORTICULTURAL SHOW.

AUGUST 10.—This annual event took place in the Alexandra Park, in overcast and windy weather, which deterred many persons from visiting the show. The result goes far to confirm my opinion, that country flower shows are united out, and even the addition of good bands and sports played, are powerless to stimulate the interest of the general public, at any rate in the south of England.

Fully aware of the waning popularity of flower shows, the Committee look to the 6d. admission to make the affair pay its expenses, and alas, almost to the universal regret of exhibitors the time of closing the tents was postponed till 10 o'clock, making it impossible to those who came from a distance to pack up and leave even by a late train. I much doubt the wisdom of this, and there was evidence it had deterred many an old supporter entering the lists, while it entailed more expense and work for the committee, not to mention the necessity of engaging extra police to take care of the exhibits. With all this, it is pleasing to record on the whole a good show, the only marked deficit being in the fruit, notably in Apples, Pears, and Plums, while Figs which are generally so fine, were conspicuous by their absence. Grapes made the best display, Madresfield Court and Alexandra Muscats being extra fine, both in berry and colour.

The honours in flowering and foliage plants, and Ferns, were pretty equally divided between Mr. J. WARREN, Handcross Park, Mr. T. PORTNELL, Beaufort, and Mr. ALF. GADD, St. Leonard's, the second failing this year to take the high standing he usually does, but in neither collection was there a plant that deserved special mention. Class 6, eight exotic Ferns, was well filled, Mr. J. WARREN taking 1st, with grand examples of *Davallia polyantha*, *Marattia alata*, *Adiantum*

cardiochlaena, *Nephrolepis davalloides* *furcans*, *Cibotium Barometz*, and others.

Cut Flowers were few and not up to the usual standard, which must be due to the dry season. Roses, only one exhibitor in twenty-fours, and a very good fresh box, quite an eye-opener to local exhibitors, but no better than one might expect from a "National" prize-winner. For the first time I have seen *Nemesis Suttoni* staged in a collection of cut annuals, and it attracted much attention, while hybrid annual *Chrysanthemums*, *C. carinatum* × *C. segetum* were most conspicuous, owing to the richness of their colours, particularly the variety named *Morning Star*. It was a little too early for Dahlias, but there was a good competition, the local champion, J. STREDWICK, coming in well both for show, Cactus, and Pompons.

Fruit.—There was nothing of extra merit in the fruit, though the Peaches of J. SNOW, Wadhurst, were good in colour, size, and finish; and a fine dish of Plums, *Reine Claude du Comte d'Athens* were conspicuously 1st, coming from Mr. J. WARREN, gr., Handcross Park. Melons were too mixed, and not of fine colour, and they gave the judges a thankless task. Would it not be better to give four prizes for Melons, leaving the exhibitor to show green or scarlet-fleshed, or other kinds at his option?

Table Decorations not so good as usual, Miss RUST, of St. Leonard's, being a good 1st, but overdone with Gypsophila. Another local exhibitor took 1st in the open class, J. NORCUTT making lavish use of the leaves of *Aralia Veitchii* and other fine-foliage to finish and fringe his stands, while the pretty neutral-coloured *Streptocarpus Rexi* was used with telling effect in combination with flowers of brighter hue.

Groups were up to the usual standard of excellence, Mr. PORTNELL securing an easy 1st, his three plants of *Disa grandiflora* being very telling.

Nurserymen's Exhibits were few. Mr. J. CHARLTON, Tunbridge Wells, staged about sixty bunches of cut flowers of hardy herbaceous perennials, and he had also fifty bunches of seedling Carnations and Picotees, some of which were of considerable merit.

In conclusion, I am glad to be able to say that the experiment of keeping open till 10 o'clock answered well financially, as there was a crush of spectators in the evening; but there was muttered thunder among those exhibitors who came from a distance, and had not netted enough prize-money to afford them bed and board at the Queen's Hotel. *Experience.*

MILVERTON HORTICULTURAL.

AUGUST 11.—The eighth annual exhibition of this Society was held on the above date, in four tents, two of which were set apart for cottagers' produce, and, taken on the whole, numerous fine exhibits of vegetables, fruit, and flowers were brought together.

In the gentlemen's gardeners' tent, the groups formed the most attractive feature, and the 1st prize was won by P. GROVE, Esq. (gr., Mr. E. M. GARLICK), whose arrangement displayed much originality in design; J. D. BARBOUR, Esq. (gr., Mr. G. HOPKINS), taking 2nd prize, with a tastefully-arranged lot of plants.

Some good examples of Ferns were shown. The 1st prize for three specimens was taken by T. WILCOX, Esq. (gr., Mr. H. SNEYD). For six stove or greenhouse plants, three foliage and three in flower, C. J. SHAW, Esq., gained 1st prize, his best plants being a well-flowered *Bougainvillea glabra*, *Codiaeum Queen Victoria*, *Cycas revoluta*, and *Allamanda Hendersoniana*.

J. D. BARBOUR, Esq., was well to the front with a collection of fruit; his best dishes comprised Figs, Black Rabicoune (excellent), Ballegarde Peach, and Elruge Nectarine. The Grapes shown call for little comment. The 1st prize for two bunches was taken, for moderately good bunches of Muscat of Alexandria, by R. O. MILNE, Esq. (gr., Mr. W. DRAPER).

Non-competitive exhibits were rather many, viz., a fine group of plants, consisting of Kentias, Lilliums, *Codiaeums*, *Eulalias*, and Ferns, from Mr. R. GREENFIELD, nurseryman, Leamington, who also showed hardy herbaceous flowers in great variety. Messrs. HINTON BROS., Warwick, staged a fine and varied collection of Sweet Peas. Mr. F. PERKINS sent a fine and diversified collection of flowers and hardy herbaceous plants, in about forty diverse species. The wreaths and crosses of Messrs. FINCH & Co. were greatly admired.

Mr. E. CRAMP, of the Manor Fruit Farm, Whitnash, staged a very fine collection of fruit, consisting of a Melon, excellent Grapes, Peaches, Plums, Tomatos, &c. H. T. M.

TAUNTON DEANE HORTICULTURAL.

AUGUST 11.—Everything that could assist in making a flower show a success was to be met with at the thirty-first exhibition of this society held in Vicary Park. The entries were mostly numerous, excepting in classes which the peculiar season this year had told against, and lastly, the weather was glorious.

Specimen Plants.—Lot no one despair of finding specimen stove and greenhouse plants if they are required for any special purpose. There were five collections of twelve specimen stove and greenhouse plants in flower, and four of them made one of the finest banks of specimens we have seen for many a day. We doubt if ever before Mr. JAMES CYPHER, of Cheltenham, has put up twelve finer examples than those which won for him the 1st prize on this occasion; they were grandly grown and bloomed, and beautifully fresh.

Chief among them were *Statice profusa* and *intermedia*, *Ericas Austriana*, *Aitoniana*, *Fairicana*, and *Turnbulli*, *Ixora Duffi*, a very fine *Allamanda nobilis*, *Stephanotis floribunda*, and *Bougainvillea floribunda*. Mr. W. FINCH, Coventry, was a very good second; his leading plants were *Erica ampullacea*, a fine piece, *Allamanda grandiflora*, *Rondeletia speciosa* major, and *Stephanotis floribunda*; and Mr. ROWLAND, gr. to W. BROCK, Esq., Exeter, was 3rd, with some very good plants.

With six specimens Mr. CYPHER was again 1st, having equally fine examples of *Erica Austriana*, *E. amula*, *Statice intermedia*, *Stephanotis floribunda*, *Bougainvillea Sanderiana*, and *Ixora salicifolia*. Mr. VAUSE was 2nd, his best plants were *Erica Lindleyana*, *Bougainvillea glabra*, and *Ixora coccinea*.

In the amateurs' division for twelve, foliage plants admissible, Mr. W. THOMAS, gr. to W. G. MARSHALL, Taunton, was 1st; and Mr. ROWLAND 2nd. These positions were reversed in the class for six plants. In that for four specimens, Mr. PEEL was 1st, and Mr. ROWLAND 2nd.

Orchids.—Two collections of four Orchids were staged, Mr. W. THOMAS coming 1st with *Cattleyas gigas* and *Gaskelliana*, *Cypripedium Rothschildianum*, and a large example of *Epidendrum pismatocarpum*; Mr. J. CYPHER was 2nd, having *Vanda coerulea*, two *Cattleyas*, and *Laelia crispata*. In the amateurs' division, Mr. THOMAS was again 1st; and Mr. PEEL 2nd.

Begonias.—Other flowering-plants consisted of Begonias, shown in the open class, for eight specimens. Here Mr. THOMAS was 1st with finely-grown and flowered plants; he was also 1st with six single-flowered in the amateurs' division, but was beaten with six doubles; the Rev. J. D. PRING, Taunton (gr., S. Dyte) taking the 1st prize with capital varieties.

Zonal Pelargoniums were present in somewhat severely-trained specimens, grown in large pots. In the open class, Mr. H. MOCKRIDGE, Trull, 1st for six single and four double flowered plants; Mr. H. GODDING, florist, Taunton, 2nd in both classes. These plants were also well shown in the amateurs' division. Mr. C. HARMAN had the best four single and Mr. S. BENNETT the best four double-flowered specimens.

Fuchsias were represented by fairly well-grown and bloomed bush specimens, but they fell below Trowbridge form. Mr. H. B. GOLDSMITH was 1st in the open class with four specimens, and also in the amateurs' division, with the same number. Mr. H. MOCKRIDGE had the best specimen light variety, and Mr. W. T. TIDBURY the best dark.

Cockscombs were fairly good in both divisions. *Gloxinias* and *Achimenes* were in good character; the latter are excellent exhibition specimens when well grown, and the Taunton committee decline to drop them. They also stand by Japan Lilies, Balsams, *Petunias*, and others of the old subjects, though they appear to be gradually declining features.

The best newly-introduced plant was *Acalypha Sanderiana*, shown by Mr. THOMAS in good character, and which naturally attracted a good deal of attention. Mr. J. CYPHER was 2nd, with the same subjects a little less fully developed. The best new foliage plant was from Mr. THOMAS, one of the newer introduced *Crotons*. The best specimen stove plant was *Clerodendron Balfourianum*, from C. J. ESDAILE, Esq., Cothelstone (gr., T. Essex). Mr. T. TIDBURY was 2nd, with *Stephanotis floribunda*. The best greenhouse plants was a fine piece of *Dasyllirion acrotrichum*, from Mr. S. KIDLEY; Mr. W. FINCH coming 2nd, with a small but good specimen of *Erica Marnockiana*. Specimen Ferns, and *Lycopods*, &c., were also staged.

Foliage Plants were shown in the form of very fine specimens. Mr. J. CYPHER, who was 1st with eight, had four splendid Palms, viz., *Kentias australis*, *Fosteriana*, and *Belmoreana*, and *Latania borbonica*, and four brilliant *Codiaeums* (*Crotons*), in *Queen Victoria*, *Cheloni*, *angustifolium*, and *flambeau*. Mr. W. FINCH, who was 2nd, had *Latania borbonica*, *Codiaeum Queen Victoria*, and *Cycas revoluta*. Mr. PEEL had the best six in the amateurs' division, and Mr. ROWLAND the 2nd best. Mr. ROWLAND had the best eight exotic Ferns in the open division; and Mr. PEEL the best six in the amateurs'. As a rule, the Ferns are too much crowded at Taunton to be seen to the best advantage, for though the tents are spacious the exhibits are numerous. *Selaginellas* are also shown, but not up to the mark of by-gone reputation. Nice bushes of *Colours* were staged, and there were pretty table plants.

Groups of Plants arranged for Effect were seen to much greater advantage than formerly, as they now have a tent to themselves. Of the four shown in the open class Mr. ROWLAND had the best good plants of the usual character, being effectively grouped in a space of 100 feet; Mr. FINCH was 2nd and Mr. PEEL 3rd. Of the four, of 50 feet, entered in the open class, Mr. ROWLAND was again 1st; Mr. C. E. ESDAILE 2nd, and Mr. PEEL 3rd.

Specimen Plants of good quality were shown by cottagers, chief among them Ferns, *Campanula pyramidalis*; one of these trained over a wire arch was very effective; *Plumbago capensis*, *Fuchsias*, *Begonias*, *Zonal Pelargoniums*, &c.

Cut Flowers are always a strong feature here, though owing to the incidence of the season, Roses, Dahlias, Asters, and Gladioli, were not up to their usual mark. Mr. J. MATTOCK, Oxford, was awarded the 1st prize for thirty-six capital blooms of Roses in the open class, having in remarkably good character Mrs. J. Laing, Alfred Colomb, Duke of Teck, Dupuy Jamain, Marschal Niel, Medea, A. K. Williams, Marie Baumann, L'Eclair, Her Majesty, Charles Lefebvre, Ulrich Brunner, Niphotos, &c.; 2nd, Mr. THOMAS HORBS, Easton

House, Bristol; Mr. MATTOCK also had the best eighteen blooms, the leading varieties being L'Eclair, Lawrence Allen, one of Messrs. Cooling & Sons' new varieties, likely to be very useful; Marchioness of Londonderry, Horace Vernet, Mr. W. J. Grant, Comte Raimbault, and Maréchal Niel. 2nd, Messrs. JARMAN & Co., Chard, With eighteen Teas, Mr. MATTOCK was again 1st, having good examples of Noman, Cochet, Maréchal Niel, Ernest Metz, The Bride, Medea, Madame Cusin, Innocente Pirola, Souvenir de S. A. Prince, and Catherine Mermet. Dr. BUDD, Bath, was 2nd. In the amateurs' division Dr. BUDD was 1st, with twenty-four, and also with twelve varieties, and also with twelve Teas; Mr. THOMAS HOBBS being 2nd in each case. Mr. G. HUMPHRIES, Florist, Chippenham, had the best twelve Dahlias; Messrs. JARMAN & Co. were 2nd. Mr. HUMPHRIES took the 1st prize, with twelve nice fancy Dahlias, being the only exhibitor. He was also 1st with six Cactus and nine Pompon varieties, shown in bunches. Mr. J. BURGESS, Kingswood, had the best nine bunches of single varieties. In the amateurs' division Messrs. HOBBS, BURGESS, and Mrs. McALLISTER, were the leading prize-winners in the classes for Dahlias.

Gladioli were somewhat poor in quality, the best twenty-four came from Mr. S. Bird, gr. to F. H. Fox, Esq., Wellington; Messrs. E. Foote & Son, Sherborne, were 2nd.

Phloxes of the herbaceous type appeared to show the effects of the drought, but stands of P. Drummondii were delightful, especially a collection from the Rev. J. D. PRING. Mrs. HICKLEY had some good trusses in the amateurs' division.

Asters fell much below their usual level, the "Comets" made the best display.

Hollyhocks.—A stand of twelve which gained the 1st prize for Mr. W. SMITH, were very good; Mr. J. BURGESS was a good 2nd.

Carnations, owing to the late season, were very good, the best twelve coming from Mr. H. W. WEGUELIN, Teignmouth, who had bold yellow-grounds and fancies; and Mr. W. S. CLEMENTS, Tiverton, was 2nd. In the amateurs' division Mr. C. WITHERS was 1st.

Begonias were shown at Taunton as cut blooms; the quality, double and single alike, good.

Twelve bunches Stove and Greenhouse Flowers.—The best came from Mr. THOMAS, consisting of some good Orchids and hot-house flowers; Mr. H. M. MAIDMENT, Bristol, was 2nd. Mr. THOMAS was also 1st in the amateurs' division.

Bunches of flowers of hardy, herbaceous, and bulbous plants were not up to the usual mark, but bunches of hardy annuals made an attractive display.

Table Decorations, including wild flowers in bouquets and collections, filled one tent. Mr. J. CYPHER had the best table piece, yellow and pale salmon-tinted Carnations being used with good effect; Mr. G. LOCK was 2nd. Mr. CYPHER was also 1st with an epergne; Mr. A. MURRELL, Bristol, was 2nd. Mr. W. H. COLES, Bristol, was 1st with a hand bouquet, and Mrs. J. CUFF, Taunton, 2nd.

Some special prizes offered by Mr. R. Sydenham, for nine bunches of Sweet Peas, introduced these charming flowers to the schedule for the first time, and a very good beginning was made. Mr. J. SNOW, The Gardens, Oakford, Devon, was 1st, and Mr. McALLISTER 2nd. Other prizes were awarded.

Collection of Fruit in eight kinds came from Mr. Strugnell, gr. to W. H. LONG, Esq., Rood Ashton, Trowbridge, who had good Alnwick Seedling and Foster's Seedling Grapes, Alexander Noblesse Peach, Stanwick Elruge Nectarine, Negro Largo Fig, Apricots, Melons, and Cherries; 2nd, Mr. A. CROSSMAN, gr. to J. BRITTON, Esq., Yeovil, who had Madresfield Court and Buckland Sweetwater Grapes, Dymond Peach, Pine-apple, Nectarine, &c. Mr. MITCHELL, gr. to J. W. FREMING, Esq., Romsey, had the best four dishes, Madresfield Court Grapes, Dymond Peach, Pine-apple, Nectarine, and Melon; Mr. CROSSMAN was 2nd. Mr. MITCHELL had the best three bunches of Black Hamburg Grapes, fine in every respect; Mr. T. W. GREAVES took the 2nd prize. Mr. MITCHELL also had the best three bunches of White Muscats, the Rev. T. GREAVES taking the 2nd prize. Any other white was Buckland Sweetwater, which won the 1st prize for Mr. Smith, gr. to W. A. TODD, Esq.; the Rev. T. GREAVES came 2nd, with Foster's Seedling. The best three bunches of any other variety of black Grape was Madresfield Court, also from Mr. MITCHELL; Mr. C. COOPER, gr. to W. McADAM SMITH, Esq., coming 2nd, with Black Alicante. Melons were represented by several fruits. The best dish of Peaches was very fine Sea Eagle, from the Frome Fruit and Flower Company; Mr. MITCHELL came 2nd, with the same variety. Some fine Apricots were staged, mainly Moor Park. The 1st prize went to Mr. F. M. NEWTON. The best dish of Nectarines was Pine-apple, from Mr. KIDLEY; Lord Napier came 2nd, staged by Mr. J. WEBBER, Dunster Castle Gardens.

Pears were sparingly shown, and of poor quality. Jargonelle and Citron des Carmes were the best. Plums were few and late in ripening. Cherries were represented by good Bigareau, Napoleon, and Morello. The best dessert Apples were Beauty of Bath, Irish Peach, and Gladstone. Currants, red and white, were fine; and many varieties of Gooseberries were staged. Kitchen Apples were plentiful, the leading varieties, Lord Suffield, Peasgood's Nonsuch, Warner's King, and Ecklinville.

Vegetables were not so fully represented in the open classes as we have seen them, but in the cottagers' tent they were very numerous and remarkably fine. Mr. T. WILKINS, gr., Henstridge House, won the 1st of Messrs. Sutton & Son's prizes; this appeared to be the principal vegetable class. Major ALDWORTH was 2nd. Potatoes were remarkably good. The class for six dishes brought clean, bright samples of

symmetrical shape. The crowded state of the tents prevented much information being obtained.

Miscellaneous collections were numerous. Messrs. KELWAY & SON, Langport, had one of their remarkable collections of Gladioli and hardy flowers; Messrs. CLIBBON & SON a fine collection of hardy flowers, &c. which they had brought all the way from Manchester; Messrs. E. WEBB & SON, Stourbridge, had hardy flowers and other plants; Mr. J. MATTOCK had charming bunches of Garden Roses; and Messrs. TUPLIN & SON and WEGUELIN, Carnations. Messrs. R. VEITCH & SON, Exeter, had a large and most interesting collection of plants and cut flowers, including many novelties; Messrs. JARMAN & Co., and Mr. B. R. DAVIS, had Begonias and other flowers; Mr. W. J. GODFREY, Exmouth, had Cannas, Carnations, &c.; and there were other smaller exhibits.

MANCHESTER & NORTH OF ENGLAND ORCHID.

AUGUST 11.—The fortnightly meeting of the above society was held in the headquarters, Coal Exchange. *Present*: Messrs. G. S. Ball, Jas. Backhouse, W. Holmes, R. Johnson, H. Greenwood, Thos. Mills (secretary), and P. Weathers.

The Orchids exhibited were few in number, but there was some striking plants, which came from Mr. R. LEDOUX, of West Derby, in the shape of a gorgeous specimen of *Aërides odoratum*, which was named A. Ledouxianum [see p. 134. Ed.] The plant was of gigantic dimensions, showing traces of splendid cultivation, and bore about seventy splendid flower-spikes. The committee awarded this plant a Silver Medal. Messrs. CHARLESWORTH & Co., of Bradford, sent *Oncidium ornithorhynchum album*, carrying four well developed flower-spikes, First-class Certificate: and a plant of *Cattleya calummata*, which received an Award of Merit. Mr. S. GRATRIX, Whalley Range, sent a fine hybrid *Cypripedium*, named C. × Olivia, the parents of which are C. tonsum × C. concolor. The flower is of good size and well-proportioned, with a similarity to C. × Antigone, and C. Aphrodite in colour and marking, First-class Certificate. Mr. G. W. LAW-SCHOFIELD, Rawtenstall, sent a very pretty *Odontoglossum crispum*, which is flowering from a newly-imported scrap of a plant. The great feature of this flower is the lip, which is almost one mass of rich chocolate-brown. The committee desire to see it again when it has been cultivated, before making an award; judging from what could be seen of the flower on the day of showing, it promises to be one of first-rate quality. Mr. E. J. SIDEBOTHAM, Bowdon, sent a well-flowered plant of *Cattleya speciosissima*. Mr. O. O. WRIGLEY, Bury, staged a splendid form of *Cypripedium Harrisianum* superbum, undoubtedly one of the finest forms of this old hybrid in cultivation, Award of Merit. Mr. T. STATTER, Stand Hall, showed *Cypripedium* × *Excelsior* (Harrisianum superbum × *Rothschildianum*), a very distinct and good hybrid, Award of Merit; also C. × Numa, which also received an Award of Merit; *Cypripedium* insignis, called "Green-bank var.," peculiar for its flowering at this season, and certainly a charming form, of good size, inclined to be somewhat yellowish, the spots on the dorsal sepal are small and uniform, crowned by a small mass of tiny violet spots, Award of Merit. Mr. J. RICHARDSON, Hale, Altrincham, showed a well-grown and flowered plant of *Cattleya Dowiana aurea*, which received a Cultural Certificate. P. IV.

THE EDINBURGH WORKMEN'S FLOWER SHOW.

AUGUST 13.—This show, the president of which is the Rt. Hon. Mitchell Thomson, Lord Provost of Edinburgh, was held in the Corn Exchange Grass Market, Edinburgh, on the above date.

The full official announcement deserves insertion here, as lucidly setting forth the age and scope of this very useful and successful society. From this it appears that this is the thirty-fourth annual exhibition of plants, belonging to the working classes of Edinburgh, grown at windows, or in small garden plots, back-greens, area-gardens, &c. Fully 400 prizes were awarded. The show was open from 1 to 8 o'clock: admission from 1 to 3, 6d.; from 8 to 8, 1d. Deep interest was taken in the show, and especially in the distribution of the principal prizes, which, in the absence of the Lord Provost, were ably and genially distributed by Professor Geddes. Among others on the platform were Mr. and Mrs. D. T. Fish, Councillor John Harrison, Mr. R. Morrison (the treasurer), and Mr. George Brodie (the secretary). Mr. Fish, in moving a hearty vote of thanks to the subscribers, spoke hopefully of the power of horticulture in the sweetening and ennobling of the home and the life. The usual votes of thanks were then proposed to the committee of management, the various officials, and to Professor Geddes, for so ably presiding over the meeting for the presentation of prizes.

SHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT.

AUGUST 15.—The monthly meeting of the above Society was held at the Parish Rooms, Shirley, Southampton, on the above date, when Mr. W. F. MAYOSS presided over a rather thin attendance of the members.

J. H. Aldridge, Esq., M.D., gave a very useful and interesting lecture on "Farm and Garden insects, and their relation

to Flowers and Crops," illustrated with lantern slides. Mr. R. Beck assisted the lecturer with a number of beetles, being one stage in the existence of some of the insects dealt with. Mr. Beck, in a few strong remarks, contrasted the usefulness of the American Bureau of Agriculture with our own Government Department, in the former case, free advice being given on any question of crops, land, or insects, in any one of the States, quite free of costs except postage. Hearty votes of thanks were accorded to the lecturer, to the exhibitors, and to the chairman at the close of the lecture.

SHROPSHIRE HORTICULTURAL.

AUGUST 17, 18.—The annual exhibition of the Shropshire Horticultural Society was held on the above dates in the Quarry Grounds, Shrewsbury. The opening day was remarkably fine, and a splendid exhibition was made.

Plants, and especially the group classes, were much as usual—they can hardly be excelled. Mr. CYPHER again won the class for the large group of miscellaneous plants, with an arrangement that may be well described as a work of art, and Mr. EDMONDS' 1st prize exhibit in an equally extensive group of ornamental foliage plants was equally or more remarkable. We have not seen a group containing better cultivated specimens than many of the *Acalyphas* and other species shown by Mr. EDMONDS.

Fruit was shown in abundance, and the quality of almost all of it was magnificent. There were upwards of 320 bunches of Grapes in the exhibition, and some of these were more than remarkable—they were extraordinary. Muscats and other first-rate varieties were splendid, and among the 2nd class varieties we have never seen better Duke of Buccleugh and Gros Guillaume. Collections of fruit, Peaches, Nectarines, Apricots, and other kinds were capital. The decorative dessert table, and the garden produce classes were judged on the point value system, and the prizes in each case amounted to what the point value of each exhibit was worth. Thus the difference between the money value of the 1st and 2nd prizes is supposed to be commensurate with the difference in merit of the two collections. Cut flowers were shown in quantity, and the non-competitive exhibits from the trade helped to increase considerably the display in the six tents.

Vegetables were good, and the tent that was filled with the cottagers' productions in fruits, flowers, and vegetables, bore evidence to the interest taken in gardening by many of the cottagers.

The Hon. Secretaries, Messrs. Adnitt and Naunton, again demonstrated how smoothly the arrangements of a large exhibition may be made to run.

PLANTS.

Groups.—For the best miscellaneous group, in and out of bloom, arranged for effect, occupying a space of 300 square feet, Mr. CYPHER, of Cheltenham, was well to the fore, with another of his characteristic light and tasteful combinations of flowers (both of choice and commoner things) and of foliage, which blended so well one with the other. A graceful plant of *Phoenix rupicola* was used as a central object, being flanked on either side by four well-grown examples of *Humea elegans*. Light Palms and *Aralias*, *Fraxinea ramosa*, *Liliums* on single stems, graceful *Oncidiums*, and finely-coloured *Cattleyas*, made up a splendid group, in conjunction with very bright plants of the choicest *Crotons*. The 2nd prize was well won by Mr. FINCH, of Coventry, whose group as a whole was even brighter than Mr. Cypher's; but the effect was not so light, the rustic cork used being a little too much displayed. The plants here were also finely grown, *Ixoras* and *Crotons* being used with telling effect. Mr. Roberts, gr. to Miss WRIGHT, of Helston Hall, Coventry, showed an admirable group for the 3rd prize, the ground-work of dark green moss, however, made it a little too sombre in appearance.

In the class following, and of similar dimensions, but composed of foliage plants only, Mr. EDMONDS, gr. to the Duke of St. Albans, Bestwood, Notts, was fairly in advance of Mr. CYPHER, to beat whom redounds to the credit of any exhibitor. Mr. EDMONDS is well-known for group exhibition, but on this occasion he fairly surpassed himself with a group which has scarcely ever been equalled, and certainly never surpassed. Every plant was used so as to be seen with advantage, whilst the groundwork was beautifully undulated. The most notable features were the finely-coloured plants of *Acalypha musaica*, the tallest of which were fully 7 feet high, and well clothed to the base, each plant with one stem only; highly-coloured *Crotons* and *Dracenas*, with dwarf *Caladiums* and *Begonias*, added to the effect, which was further enhanced by the light and graceful *Bamboos*, *Casuarina* (sp.), and *Palms*. Mr. CYPHER, who came in 2nd here, had a group of similar arrangement to his premier one in the former class, omitting the flowering plants. *Crotons* were here used with telling effect, the blending of other plants with the foregoing being excellent, the groundwork being rich with choice little stove plants. The 3rd prize was awarded to Mr. FINCH, who was apparently unable, for want of sufficient material, to finish his arrangement so well as he would otherwise have done.

Specimen Plants, &c.—An additional class, and a most commendable one, was on this occasion included in the Shrewsbury schedule, viz., one for thirty stove or greenhouse plants, limited to 10-inch pots, not fewer than twelve to be in flower. Mr. Lambert, gr. to Lord HARLECH, Brogyntyn, Oswestry, staged an admirably grown group of choice and well chosen subjects; of the flowering plants he had profusely flowered dwarf examples of *Ixora* in choice kinds, and others of *Dipladenias*, equally as good. The foliage plants were chiefly of *Crotons* and *Dracenas*, with *Phormium varie-*

gatum, Alocasia Sanderiana, Heliconia illustris, and some clean Palms. Mr. CYPHER, who was 2nd, had as his best plants Ixoras and Allamandas in variety, with Phenocoma prolifera Barnesi and a good Erica, with two bright plants of Statice intermedia, his Crotons, Dracaenas, and Ferns being likewise good.

For twenty specimen stove and greenhouse plants, not fewer than twelve to be in flower, Mr. CYPHER was invincible. He has rarely staged a group of plants of similar merit. The flowering plants were Phenocoma prolifera Barnesi, a dense plant in profuse flower and well coloured, being some 5 feet across; two splendid plants of Statice profusa and S. intermedia, the latter much the better as regards colour; three superb Ericas, viz., E. Austriana, E. ampulacea Barnesi, and E. Irbyana, a trio of the best autumn Heaths; two very fine Ixora macrothyrsa, with dense, brilliant, and huge trusses; two Bougainvilleas, B. glabra and B. Cypheri, with a good Allamanda nobilis and Clerodendron Balfourianum. Of foliage plants he had three immense plants of Kentias at the back in the best of health, a large plant of Latania borbonica, and four well-furnished specimens of Crotons, viz., C. Sunset, C. angustifolius, C. Chelsoni, and C. Queen Victoria, all being brilliant in colour. Mr. FINCH was awarded a 2nd prize in this class, his best plants being Sobralia macrantha nana, well flowered; Rondeletia speciosa major, with some good Ericas and Ixoras.

For a single specimen stove or greenhouse plant, Mr. CYPHER was once more to the fore with a large well-flowered example of Erica Austriana, very fresh and bright; and Mr. FINCH 2nd, with Erica Marnockiana, smaller, but good; and Mr. LAMBERT 3rd, with Dipladenia amabilis, also well flowered.

With six plants, not fewer than four in flower, Mr. LAMBERT repeated his previous success, showing large well-managed plants of Ixora Williamsi and I. Pilgrimi, with a capita Allamanda Hendersoni, and a very good Dipladenia amabilis, also a grand plant of Croton Warreni, in quite a small pot, and Kentia Belmoreana.

For six plants in another similar class, Mr. Innes, gr. to G. BURR, Esq., Oaklands, was 1st, with medium-sized plants.

Other Plant Classes.—Small Pelargoniums, six varieties, 1st to Mr. MYERS, florist, Sutton Lane Nurseries, Shrewsbury, for an excellent exhibit, the plants dwarf and bushy, well clothed with foliage, and bearing immense trusses of flowers. Mr. BATEMAN, Abbey Foregate, Shrewsbury, who was 2nd, had a capital half-dozen.

Zonal Pelargoniums (doubles), six varieties, 1st to Mr. MYERS, who had similarly good plants to those in the preceding class; 2nd to Mr. A. BATEMAN, with another worthy half dozen.

Dracaenas, six varieties.—1st to Mr. Bird, gr. to Mr. WATKINS, Shotton Hall, Shrewsbury; 2nd to Mr. LAMBERT, both having vigorous plants, but scarcely up to the mark in point of colour.

Table plants, twelve varieties.—1st to Mr. EDMONDS, with light and pretty examples, well furnished down to the pots; 2nd to Mr. A. Hall, gr. to J. C. WATERHOUSE, Esq., Prestbury, Macclesfield.

Orchids, six varieties.—1st to R. C. Townsend, gr. to Col. R. T. LLOYD, Aston Hall, Oswestry, with a capital exhibit for the season, the Cattleya gigas, C. Mossii, and C. Mendelli all being fresh and good. 2nd to Mr. Steventon, for Cypripedium Parishii and C. barbatum nigrum.

Glazinias, twelve plants.—1st to J. PARSON-SMITH, Esq., the plants dwarf, with finely-developed flowers in good selections of colour.

For a collection of thirty plants in pots not exceeding 5 inches diameter.—1st to Mr. Townsend, gr. to Col. R. T. LLOYD, the best being Cattleya gigas, Cypripedium Rothschildianum and C. Charlesworthi, with 2nd to Mr. Birch, gr. to Mr. WATKINS, Shrewsbury.

Fuchsias, three varieties.—1st to Mr. ALBERT MYERS, with dwarf plants, freely flowered, and in small pots; 2nd to Mr. BATEMAN, with plants not so freely flowered.

Fuchsias, three varieties (smaller).—1st to Mr. Walford, gr. to Mr. WACE, College Hill, with capital decorative plants; 2nd to Mr. BATEMAN.

Begonias (Tuberous), six varieties.—1st to Mr. DAVIS, Yeovil, Somerset, who had only double varieties of his own select strain, the plants extremely dwarf and sturdy, with flowers equal to a Hollyhock in size; 2nd to Mr. Jones, gr. to A. M. BARBER, Esq., Wellington.

Coleus, four varieties.—1st to Mr. A. MYERS, for grand plants, averaging 5½ feet high, and 3 feet through, of close pyramidal shape, and well coloured; 2nd to Mr. Steventon, gr. to Mr. J. H. SLANEY, who had good plants.

Caladiums, six varieties.—1st to Mr. Sawley, gr. to Mr. DARBY, Adcote. They were good plants, but of the older kinds.

Ferns, Exotic, six varieties.—1st to Mr. Edward Jones, gr. to A. M. BARBER, Esq., Wellington, who had four finely-grown Adiantums amongst others.

Group of 150 square feet, open to the County of Salop only.—1st to Mr. Tugwood, gr. to T. F. KYNNESELEY, Leighton Hall, Trowbridge, for a light arrangement, in which Eulalia japonica was used to good effect, but the ground-work was hardly complete, being bare; Mr. C. ROBERTS, who was 2nd, had a pretty group, which was deficient in flower, otherwise it would have run the other very close; 3rd to Mr. Bremmell, gr. to H. H. FRANCE-HAYHURST, Esq., Overley, Wellington, whose group was rather overcrowded, otherwise very pretty and tasteful.

FRUIT

As usual at the great Shrewsbury Show, which is always held in August, the display of fruit was splendid. We noticed no particular kind as being in any sense weak.

Decorative Fruit Class.—The class for a decorative dessert-table has been a feature at Shrewsbury for several years past, and a pretty one also. The table is 10 feet by 4 feet 6 inches. This fruit-table may be decorated with cut flowers and foliage-plants, but decanters, wine-glasses, electro-plate, &c., are excluded. The greatest number of points, 124, was obtained by Mr. J. McINDOE. His floral decorations consisted of two tall glasses, a central epergne furnished with Carnations, Montbretias, and Acacias, &c., and a few smaller glasses. He had four bunches of Grapes, one of Chasselas Napoleon, one of a new Grape, named Black Duke, a seedling from Gros. Guillaume crossed with Duke of Buccleugh; also Muscat of Alexandria, and Madresfield Court. There were two Melons, one of McINDOE's Best of All, and one of Yorkshire Beauty. His Spencer Nectarines were very highly coloured, and Pineapple, Nectarines, Stirling Castle Peaches, also Pears, Apples, and Figs, were all commendable.

Mr. J. H. Goodacre, gr. to the EARL OF HARRINGTON, Elvaston, obtained 119 points.

Garden Produce Class.—This is a class for the best arranged exhibit of garden produce on a space 8 feet by 4 feet 6 inches; any foliage may be employed for decoration. There were six dishes of fruits and six dishes of vegetables. The best show was made by Mr. J. H. GOODACRE, who obtained 102 points. He had two very large bunches of Barbarossa Grapes, and two of Muscat of Alexandria; also a good Melon, excellent Peaches and Nectarines, Apples, Tomatos, Cauliflowers, Beans, Peas, Potatos, &c. Mr. J. McINDOE was the next best in the class, winning 90½ points; he had excellent Muscat of Alexandria and Madresfield Court Grapes, Peaches, splendid Plums, Nectarines, Melons, Tomatos, Celery, &c. Mr. T. WILKINS, gr. to the Lady THEODORE GUEST, Henstridge, Blandford, obtained 90½ points, and Mr. S. BREMMELL 8 points.

The best collection of fifteen dishes of fruit, in not fewer than fifteen varieties, was from Mr. J. H. Goodacre, gr. to the EARL OF HARRINGTON, Elvaston, Derby. He had Muscat of Alexandria, Gros Maroc, Canon Hall Muscat, and Alnwick Seedling Grapes, two rice Melons, and Queen and Cayenne Pines; also Lord Napier Nectarines, Royal George Peach, Moor Park Apricot, Brown Turkey Figs, Transparent Gage Plum, Williams' Bon Chrétien Pear, and Lady Sudeley Apples. The fruit, including Grapes, was of first-class quality. The 2nd prize was taken by Mr. J. McINDOE, gr. to Sir J. W. PEASE, Bart., Guisboro', Yorks; and 3rd, Mr. J. EDMONDS, Bestwood Gardens, Notts.

The winner of the class for a collection of nine dishes of fruit, Pines excluded, was Mr. J. Jones, gr. to Mrs. F. MEED, York House, Malvern, who had very fine Madresfield Court Grapes, excellent Peaches, Nectarines, Figs, and Apricots. The 2nd prize was well won by Mr. BANNERMAN, gr. to Lord BAGOT, Blithfield, Rugeley; and Mr. A. McCulloch, gr. to W. F. WEBB, Esq., Newstead Abbey, Notts, was 3rd.

The best nine dishes of fruit, open to Salopians only, was from Mr. CHAS. ROBERTS, gr. to Miss WRIGHT, Haleson Hall, Oswestry. The Apricots, Nectarines, Peaches, and Grapes were the best dishes. 2nd, Mr. J. Langley, gr. to the Rev. F. M. BULKELEY OWEN, Tedsmore Hall, West Felton, whose Madresfield Court Grapes were remarkably good in size of bunch and berry. 3rd, Mr. S. Bremmell, gr. to H. H. FRANCE-HAYHURST, Esq., Overley, Wellington. There were six exhibitors.

The best four bunches of black Grapes, in two varieties, were Black Hamburg and Madresfield Court, from Mr. J. CAMPBELL, gr. to C. M. NEWTON, Esq., Mickloover Manor, Derby. The long, rather thin bunches of Madresfield Court had excellent berries and high finish. Black Hamburg had likewise capital finish. 2nd, Mr. J. LANGLEY, who had Black Hamburg, and fine large heavy bunches of Gros Maroc. 3rd, Mr. G. DAVIES, gr. to Rev. F. ALDERSON, Welsh Frankton. There were eight exhibitors.

The best four bunches of white Grapes were from Mr. J. CAMPBELL, whose Canon Hall Muscats were magnificent in colour and size of berry; his other variety was Muscat of Alexandria. An excellent 2nd was Mr. T. Lambert, gr. to the Right Hon. Lord Harlech, Brogyhydy, who had very large Muscats, but of less finish, and first-class bunches of Foster's Seedling. The 3rd prize was taken by Mr. Alex. Kirk, gr. to J. T. LATON, Esq., Norwood, Alloa, N.B., who had immense Duke of Buccleugh and Muscat of Alexandria. There were four other exhibitors.

The class for two bunches of Black Hamburg Grapes was won by Mr. J. CAMPBELL in fine style, and he was followed by Mr. D. Airdrie, gr. to J. H. N. GRAHAM, Esq., Stirlingshire, and Mr. J. Jones, gr. to Mrs. F. MEED, Malvern. There were fourteen exhibitors.

Madresfield Court Grapes were shown best by Mr. J. JONES; Mr. J. CAMPBELL was 2nd, and Mr. L. Barlow, gr. to F. R. TREMLOW, Esq., Market Drayton, 3rd. There were other exhibitors.

Black Alicante in two bunches from Mr. J. LANGLEY were especially fine in size of bunch. Mr. F. BANNERMAN beat Mr. A. H. Hall, gr. to J. C. WATERHOUSE, Esq., Macclesfield, for 2nd place.

The best Gros Maroc were extra large-berried bunches from Miss J. CAMPBELL, and those from Mr. A. KIRK, who was 2nd, were hardly less good. 3rd, Mr. J. LANGLEY.

Muscats from Mr. W. Pilgrim, gr. to Sir J. MAYRICK, Bart., Redorgan, were long bunches of moderately finished berries.

The 2nd prize went to Mr. J. CAMPBELL, and the 3rd to Mr. J. Skitt, gr. to Mrs. H. BRIGHT, Ashfield, Liverpool.

The "Any other white variety" was won by Mr. A. KIRK, who had extraordinary bunches of Duke of Buccleugh, the berries being uncommonly large, but not exceptionally well finished.

The "Any other Black Grapes," open to Salopians only, was won by Mr. J. LANGLEY; and the same exhibitor won for two bunches of Black Hamburgs; also a local class.

Mr. T. Lambert, gr. to Lord HARLECH, had the best two bunches of Muscats, open to Salopians only.

Mr. W. Dawes, gr. to Lord TREVOR, Brynkymalt; and Mr. F. Tugwood, gr. to T. F. KYNNESELEY, Esq., Ironbridge, had also 1st prizes in local Grape classes.

Peaches.—There were thirteen entries for the best six Peaches and a dish of Barrington, the fruits being large and well coloured, from Mr. J. BOWERMAN, gr. to C. H. HOARE, Esq., Basingstoke, who was 1st. Mr. W. IGGULDEN, Frome, Somerset, was 2nd, with extra large Sea Eagle; and 3rd, Mr. J. H. GOODACRE.

The best six Nectarines were from Mr. J. Howard, gr. to Sir R. SUTTON, Bart., Newbury, who had intensely coloured fruits of Pine-apple; 2nd, Mr. J. BOWERMAN, with Pine-apple; and 3rd, Mr. C. Crooks, gr. to the Dow. Lady HINDLIP, Droitwich. There were thirteen exhibitors.

The best six Apricots were from Mr. R. Goodacre, gr. to F. BATES, Esq., Whitfield, who had Early Red; 2nd, Mr. J. GOWARD, with the variety Moor Park; and 3rd, Mr. C. CROOK. There were twenty-four exhibits in this class, and many of them were excellent.

Plums.—Mr. J. McINDOE had the best dish of green or yellow Plums, showing Early Transparent Gage; Mr. J. LANGLEY, with Transparent Gage, was 2nd; and 3rd, Mr. J. HOWARD, with Magnum Bonum.

In the class for Purple or Red Plums, Mr. J. H. LANGLEY beat Mr. DAVIES, gr. to W. E. KING, Esq., Leominster.

The best green-fleshed Melon was Sutton's Hero of Lockynge, from Mr. W. Pilgrim, gr. to Sir GEO. MEYRICK, Bart., Anglesey. There were fifteen exhibitors.

The best scarlet-fleshed Melon was shown by Mr. J. Durnell, gr. to R. L. KENYON, Esq., Oswestry, the variety being unlabelled.

The best dish of Cherries was shown by Mr. J. H. GOODACRE, and there were eleven other exhibitors.

Apples, Pears, and Plums were shown in four classes, open to the county of Salop only, and considering the date of the season, the exhibits of culinary and dessert fruits were admirable.

VEGETABLES.

These were excellent, the Potatos especially, and the number of exhibits, as usual, was large. The collections in the special prize classes were all that could be wished; and, indeed, as fine as we suspect could be shown in any country in Europe. Below we have given particulars of some of the principal classes; but there were also others, including a number of single-dish classes, for prizes offered by Mr. R. SYDENHAM.

In Mr. ED. MURRELL's special class for twelve varieties, the best exhibitor was Mr. R. C. Townsend, gr. to Colonel R. T. LLOYD, Aston Hall, Oswestry. He had very fine Onions, Cauliflowers, Tomatos, Pears, Cucumbers, and Potatos; Mr. J. Robinson, gr. to R. W. D. HARLEY, Esq., Brampton Brian Hall, was 2nd.

For Mr. MURRELL's prizes for a collection of six kinds, Mr. J. Abbott, gr. to Mrs. GUISE, Hadnall, was the best exhibitor.

MEASRS. FRITCHARD & SONS, Shrewsbury, offered prizes for the best twelve dishes of Potatos, and the winner, Mr. J. COOKE, Corner Farm, had a collection that worthily won 1st position.

The best bunch of nine autumn Onions was from Mr. G. Risebrow, gr. to Col. KENYON SLAYER, Shifnal, and Mr. B. Ashton, gr. to the EARL OF LATHOM, Ormskirk, was 2nd.

Mr. G. Lye, gr. to Mrs. KINGSMILL, Newbury, beat all competitors for a bunch of spring-sown Onions, and was followed by Col. KENYON SLAYER.

The best six Turnips were from T. B. WOOD, Esq., Ludlow, and the best six Carrots from Mr. T. WILKINS, gr. to Lady THEODORE GUEST, who had Sutton's New Red Intermediate. Mr. R. LYE, who had Tender and True, won 1st prize for six Parsnips.

Celery was good for the present date, and the best was from Mr. J. ABBOTT.

Cauliflowers were, as usual, of capital quality. Mr. J. Birch, gr. to Mrs. WATKINS, Shotton Hall, had the best three Carters' Autumn Giant.

Scarlet Runner and French Beans were shown in considerable quantity, and, as usual at Shrewsbury, the general quality was high. The same may be said for the Peas. Mr. B. ASHTON had the best dish of these, and Mr. POPE, gr. to the EARL OF CARNARVON, Highclere Castle, Newbury, was 2nd.

There were fifteen pairs of Cucumbers, the best being from Mr. R. LAWLEY, gr. to Mrs. DARBY, Adcote, who had Sutton's Peerless.

The best dish of Tomatos was an excellent type of Perfection, and was shown by Mr. A. H. HALL.

In the Potato classes quite a number competed for the prizes for five dishes; and the best collection was from Mr. B. ASHTON. He had Sutton's Al Reliance, Duke of York, Mrs. Breeze, and Veitch's Prolific. The 2nd prize went to Mr. A. H. FORDER, gr. to Col. W. CORNWALLIS-WEST, Ruthin Castle.

Mr. J. J. BREWIN won in the class for three dishes, showing Mrs. Breeze, a coloured kidney; Cigarette, a nice cooking round white ; and International. Mr. C. J. Waite,

gr. to Sir P. TALBOT, Glenhurst, Esher, was 2nd. Mr. Waite had also the best single dish of Potatoes in Sutton's Windsor Castle, a very excellent half-dozen tubers.

The winner of Messrs. Carter & Co.'s 1st prize for a collection of twelve distinct kinds was Mr. W. POPE and Mr. C. J. WAITE was a capital 2nd, whilst there were four other collections.

In Messrs. Sutton & Sons' class for nine kinds, there were six prizes offered, and it was Mr. W. POPE who had the honour to beat the rest of the competitors. The quality left nothing to be desired, and Mr. R. LYE, who was 2nd, and Mr. J. BOWERMAN, who was 3rd, may also be complimented on the quality of their exhibits. There were nearly a dozen competitors in this class, and the produce was a most important feature of the vegetable section.

Mr. J. BIRCH won 1st prize for a collection of eight kinds in a class in which the prizes were offered by Messrs. Jones & Sons, Shrewsbury, and there were several other exhibits.

Messrs. Webb & Sons, Stourbridge, offered prizes for a collection of vegetables in eight kinds, and for a dish of certain varieties of Tomatoes. The 1st position for the collection was won by Mr. J. BOWERMAN, and he was followed by Mr. W. POPE and Mr. R. LYE.

The best collection of vegetables in competition for prizes offered by the Ichthemie Guano Company, Ipswich, was from Mr. H. HUXTER, gr. to T. B. WOOD, Esq., Henley Hall, Ludlow, who won also the similar class for fruit.

Mr. J. McINDOE had the best four Melons in the class subscribed by the With's Chemical Manure Co. Hereford.

CUT FLOWERS, DECORATIVE CLASSES.

For six bouquets and six baskets with plants, Ferns, and cut foliage, in unison (a new and an instructive class) there were three competitors, and the prizes amounted in the aggregate to £37 10s., with a Silver Cup in addition to the 1st Prize. Messrs. PERKINS & SON, Coventry, were (as anyone may surmise) well to the front, winning the 1st prize with a surpassingly fine display. In the arrangements Orchids predominated, but other flowers were used with good effect. A bridal bouquet was composed chiefly of *Odontoglossum crispum* and *Pancreatium fragrans*, with Lily of the Valley. A basket of similar design, but with *Frailea ramosa* and *Pancreatium*, stood beside it, and beautiful it looked. In a bouquet the prevailing tints were yellow and brown, and here again a basket was in evidence with similar tints and colours. Another bouquet was made of *Epidendrum vitellinum*, *Ixora* and *Odontoglossum crispum*. To accompany this there was a basket of similar tints; whilst in another case *Cattleya gigas* prevailed, with the yellow *Oncidium flexuosum*, and *Dendrobium Phalaenopsis Schroderianum*. The whole exhibit having evidently been well thought out. The 2nd prize in this class was awarded to Messrs. JONES & SONS, Shrewsbury, who had a beautiful display, but not so much varied as the preceding exhibit. *Cattleyas* were here used profusely, so also was *Dendrobium Phalaenopsis Schroderianum* with *Oncidium varicosum*. Preference here was given to *Asparagus* almost entirely, whereas a few full coloured fronds of *Adiantum cuneatum* would have added to the effect. The 3rd prize was awarded to Messrs. JENKINSON & SON, Newcastle, Staffordshire.

Ball Bouquet and Bridal Bouquet.—1st to Messrs. PERKINS, who showed in their usual style; in the last named of these two bouquets, *Oncidium papilio* was used most effectively. 2nd to Messrs. POPE & SON, of Birmingham, who also had two good examples, spoiled, in one instance, by using *Cypripedium Lawrenceanum* inverted instead of erect.

For two similar Bouquets, without any Orchids in their composition, Messrs. JONES & SON were easily 1st, showing two pretty arrangements.

One Bouquet of Cactus Dahlias, with any kind of foliage.—1st to Mr. W. TRESEDER, Cardiff, who had a most beautiful example made only of one variety which in itself supplied two tints, the centre of the flowers being pale lemon yellow, with the outer petals deepening to pale terra-cotta, a very pleasing combination; the foliage used being *Asparagus plumosus*. 2nd, to Messrs. POPE & SON, who had a darker coloured arrangement, being made of *Bertha Mawley*, some of the flowers being too large, but the whole was well finished.

Bouquet of Sweet Peas only, with any kind of foliage.—Messrs. POPE & SONS were 1st with an arrangement of soft colours, white and pale pink with bronzy fronds of *Adiantum rubellum*. Messrs. PERKINS & SONS, who were 2nd, used brighter colours with good effect.

Bouquet of Roses only, with Rose foliage.—Messrs. PERKINS & SONS were 1st with a charming arrangement, very light and tasteful, the prevailing tints being the apricot of William Allan Richardson, with a pale yellow Tea-scented variety; 2nd, to Messrs. POPE & SONS, who depended chiefly upon Catherine Mermet, but with good effect.

Button-holes and Sprays, six of each.—Messrs. PERKINS & SONS won here again with appropriate arrangements, not too large or too heavy, and being extremely tasteful in design. Messrs. JENKINSON & SON were 2nd, with a good selection which, if they had not been so much crowded together, would have shown to better advantage.

Single Stand of Cut Flowers.—1st, to Mr. LOVATT, with a pretty display of Sweet Peas only, easily beating other stands in which Orchids, &c., owing to bad arrangement, did not appear to advantage. 2nd, Mr. F. H. NORRIS, Handsworth.

OTHER CUT FLOWERS.

Collection of Stove and Greenhouse Cut Flowers.—1st to Mr. B. CROMWELL (gr. to T. SUTTON TIMMIS, Esq., Cleveley Hall, Liverpool), who had a very superior exhibit of huge bunches

of *Lapageria rosea* and *L. r. alba*; similar ones of *Ixora coccinea* (extra fine), *Dipladenia Brearleyana*, and *Gloriosa superba*, being likewise good; 2nd to Mr. McDONALD (gr. to G. H. KENRICK, Esq., Edgbaston), in whose box *Ixora macrothyrsa* and *I. Westii*, were extra good.

For Six Bunches in a similar Class, the 1st prize was again won by Mr. CROMWELL, with another excellent display; whilst Mr. McDONALD was again 2nd.

Roses, twenty-four single blooms—1st to Messrs. D. & W. CROLL, Dundee, who staged an extra fine box, the best blooms being Mrs. J. Laing, Her Majesty, Etienne Levet, The Queen, and Marie Van Houtte; 2nd to Messrs. HARKNESS & SONS, whose box, when notes were taken, looked the better of the two, the finest flowers were Mrs. John Laing, Comte Raimbaud, and Duc de Rohan.

Dahlias, cut blooms.—For twenty-four show and fancy vars.—1st, to Mr. M. CAMPBELL, High Blantyre, whose flowers, although of full size, were of excellent quality, fresh and bright in colour; the best were Colonist, Virginal, Willie Jarrett, and Norman. 2nd to Mr. MORTIMER, whose flowers were smaller, but good, and of distinct colours.

Messrs. JONES & SONS, Shrewsbury, in very severe competition, obtained 1st prize for a collection of Cactus Dahlias to fill a space of 5 ft. by 4 ft. The blooms were first rate, and though fewer in number than those in the 2nd prize collection from Mr. M. CAMPBELL, High Blantyre, N.B., showed to better effect. 3rd, Messrs. KEYNES, WILLIAMS & Co., Salisbury. There were several other competitors.

For twelve show and fancy vars.—1st to Mr. H. STODDARD, Florence, Longton, a good exhibit; 2nd to Mr. Seabury, gr. to Rev. L. M. BULKELY OWEN, Tedsmore Hall.

Six bunches Cactus in vars.—1st to Mr. James DAVIS (gr. to W. E. KING-KING, Esq., Bodenham Manor, the variety Delicate, being the best; 2nd to F. W. SHARPE, Esq., Twyford, and Mr. KEEBLE.

Pompons, twelve bunches, distinct.—1st to Messrs. KEYNES, WILLIAMS & Co., Salisbury, who had an admirable exhibit, the best being Lillian-Phoebe, Whisper, Emily Hopper, and Bachus; 2nd to Mr. M. CAMPBELL, whose flowers were too large.

The best collection of Carnations and Picotees shown in sprays with their own foliage and without collars or other supports was from Messrs. LAING & MATHER, Kelso, N.B. In this exhibit the blooms were very large, full, and brightly coloured, and whilst they were disposed in the best of taste, the bamboo stands being very suitable to the purpose. Among the varieties could be noticed many of the newest and most choice. Mr. M. CAMPBELL, High Blantyre Nurseries, N.B., who was 2nd, also showed very well, and Messrs. THOMSON & Co., Sparkhill, Birmingham, were 3rd.

The best collection of Gladioli sprays (Nurserymen) was from Messrs. HARKNESS & SONS, Bedale, Yorkshire. Plants and other garnishing were permitted, but beyond some sprays of *Gypsophylla paniculata* which were laid over the surface of the boxes, not any appeared in the 1st prize exhibit. The Gladioli, however, were large, bold and of excellent quality. 2nd, Messrs. WALLACE & Co., Colchester, and 3rd, Mr. W. F. GUNN, Olton, Birmingham.

There was considerable competition in the class for Mr. ECKFORD's prizes for Sweet Peas, there being nearly a dozen exhibits. The 1st prize was worthily won by Mr. A. BESSELL, 1, High Street, Ludlow. The blooms in this exhibit were first rate in quality, and in their disposition the best taste was evident.

The best six bunches of Gaillardias were from Messrs. HARKNESS & SON, Bedale.

The best twelve Carnations or Picotees, three blooms of each, were from Mr. A. W. JONES, Handsworth, Birmingham and Messrs. THOMSON, Spark hill Nurseries, Birmingham, had 1st prize for twelve Picotees. The exhibits in either instance were very good.

The best twelve Sprays of Carnations, distinct, were from Messrs. LAING & MATHER, Kelso-on-Tweed, who had very fine varieties, and the blooms and grass too were good.

Mr. J. DAVIS (gr. to W. E. KING-KING, Esq., Bodenham Manor) had a capital collection of twenty-four Asters.

Mr. Eckford's Challenge Cup, for thirty six varieties of Sweet Peas, to be correctly named, was splendidly won by Dr. C. H. C. SANKY, Boreatton Park.

The best collection of Dahlia blooms, any varieties, upon a space 10 ft. by 5 ft., shown with natural foliage and buds (Nurserymen) came from Mr. W. TRESEDER, Cardiff. This collection redounded to the credit of the Welshmen, the Pompons, singles, show varieties, and Cactus were of capital quality. Mrs. W. Noble, among the Cactus; Thomas Keith, Whisper, and Guiding Star, among the Pompons; and Beauty's Eye, single-flowered, were conspicuous. 2nd, Mr. M. CAMPBELL, and 3rd, Messrs. KEYNES, WILLIAMS & Co., Salisbury.

The best collection of tuberous rooted Begonias as cut flowers or plants, was a collection of plants from Mr. B. DAVIE, Yeovil Nurseries. Stella, salmon pink double Thunderer, double scarlet, Ajax, double crimson, Royal Sovereign, beautiful tint of yellow, Klondyke, double yellow, and Mrs. Nichols, pretty pink, were conspicuous varieties in this fine exhibit.

NON-COMPETITIVE EXHIBITS.

Messrs. PRITCHARD & SONS, Shrewsbury showed a magnificent collection of seedling border Carnations in upwards of eighty sprays, some of which were composed of as many as thirty blooms. Messrs. PRITCHARD & SONS had also a large group of Ferns, for the most part consisting of choice varieties of the better known species. The plants though small, were good and representative.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, made a pretty display of cut flowers. *Gladiolus Gandavensis* hybrids, many beautiful varieties of *Montbretias*, Lilies, border Carnations, Gaillardias, &c., were noticed. Of the fifteen varieties of *Montbretias* shown, *Gerbe d'Or* yellow; *Etoile de Feu*, scarlet; and *flore pleno*, a double-flowered variety, were conspicuous. The exhibit was backed by capital spikes of *Tritoma* and other fine flowers.

Messrs. F. SANDER & Co., St. Albans, had a group of choice and rare plants, in which the showy *Acalypha Sanderiana* was again very effective; several *Nepenthes*, a nice plant of *Dendrobium bigibbum*, *Cattleya Gaskelliana*, and an immense clump of *Dracena Sanderiana* were principal feature.

Mr. Peter Blair, gr. to His Grace the DUKE of SUTHERLAND, Trentham Hall, Staffordshire, exhibited blooms of a new border Carnation named Trentham Rose. It is a clear rose colour, apparently of very free habit, moderate size, and does not burst its calyx. (First-class Certificate.)

Messrs. H. CANNELL & SONS, Swanley, Kent, treated the Salop people to a view of some of their lovely Cannas, which were staged in the spacious marquee in which the large groups were arranged. The best varieties were well represented, and a very gorgeous group of plants was the result.

THE JADOO COMPANY, Ltd., had a group of stove and greenhouse plants in pots, growing in the Jadoo Compost.

Messrs. R. SMITH & Co., Worcester, upon the ground-floor, made a display of hardy herbaceous flowers, intermixed with ornamental plants in pots. *Arundo Donax* and some other sub-tropical plants were included in this interesting exhibit.

Mr. ALBERT MYERS, Sutton Lane Nurseries, Shrewsbury, had a group of Zonale *Pelargoniums* in pots, also sprays of same. They represented very fine varieties, and were well-grown specimens.

A large exhibit from Mr. J. H. WHITE, Worcester, contained *Crotons* and other stove plants, also greenhouse species and hardy plants, including *Gladiolus* sprays, &c.

Mr. H. DEVERILL, Banbury, showed a grand lot of herbaceous perennial cut flowers, and Mr. JOHN FORBES, Hawick, N.B., had blooms of Cactus and show Dahlias, also Carnations of the various sections, *Pentstemons* and other plants.

Messrs. W. J. BIRKENHEAD, Fern Nursery, Sale, Manchester, made one of their well-known and popular exhibits of choice species of Ferns.

From Messrs. E. WEBB & SONS, Stourbridge, came bunches of hardy flowers, a collection of plants in flower illustrative of their Excelsior strain of *Gloxinias*, also tuberous-rooted *Begonias*, in pots, Sweet Peas in sprays, and a few good vegetables.

Dahlias were shown by Mr. S. MORTIMER, Rowledge Nursery, Farnham, Surrey, who had nine dozen very fine blooms of Cactus, and show varieties.

Mr. ED. MURRELL, Portland Nursery, Shrewsbury, had a group of cut Roses, representing such popular varieties as Mrs. John Laing, Marchioness of Londonderry, &c., also some of the prettiest Noisettes.

Mr. B. R. DAVIES, Yeovil Nurseries, had a group of fine tuberous-rooted *Begonias* in pots.

Mr. H. PATTISON, Cherry Orchard, Shrewsbury, exhibited blooms of *Violas* and *Pansies*.

From Messrs. R. HARTLAND & SON, Lough Nurseries, Cork, came a collection of blooms of tuberous-rooted *Begonias*.

Mr. HENRY ECKFORD, of Wem, Salop, as might be expected so close to his home, showed a collection of his beautiful varieties of Sweet Peas, and a Gold Medal was awarded him for them.

Messrs. JARMAN & Co., Ltd., Chard, Somerset, showed good vegetable, especially Potatoes and Onions, and in addition a quantity of Dahlias and other flowers.

Mr. WILLIAM SYDENHAM, Tamworth, had a display of *Viola* blooms put up in sprays, and Messrs. HARRISON & SONS, Leicester, a collection of Broad Beans.

Messrs. DICKSON, Ltd., Chester, staged a group of miscellaneous plants, including specimens of *Cupressus macrocarpa lutea*, their new *Cordylus Kippisii*, and *Acalypha Sanderiana*.

Obituary.

JAMES PULHAM.—Many of our readers, and especially those who have had dealings with Mr. Pulham in the capacity of garden architect and constructor of rockeries, waterfalls, lakes, &c., will regret to learn of his death, which took place on Thursday, August 11, at the age of 78 years. The funeral took place at Broxbourne churchyard on Monday (15th). We are informed that the business will be carried on as heretofore under the same title.

GARDENING APPOINTMENTS.

Mr. F. W. CAVILL, for the past two years Gardener at Ainderby Hall, Northallerton, as Head Gardener to J. J. HARRIS, Esq., Derwent Lodge, Papecastle, near Cockermouth, Cumberland.

Mr. CHARLES WILLIAM TURNER, as Head Gardener to Mr. DIX PERKIN, Greenford Green, Harrow, Middlesex.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending August 13, is furnished from the Meteorological Office:—

"The weather was rainy and very unsettled generally during the earlier part of the week, but after Tuesday it cleared up over England, and subsequently over the eastern parts of Ireland and Scotland also; in the extreme west, however, rain continued to fall daily.

"The temperature was, as a whole, slightly above the mean for the time of year, except over the 'Midland Counties,' 'England, S.W.,' and 'Ireland, N.,' where the average values for the week were identical with the mean values for the time of year. The highest of the maximum were registered towards the end of the week, and ranged from 35° over 'England, S.,' 'England, E.,' and the 'Midland Counties,' 83° over 'England, S.W.,' and 'England, N.E.,' and 86° over 'Scotland, E.' and 'Scotland, W.,' to 78° in the 'Channel Islands,' 76° in 'Scotland, N.,' and 74° in 'Ireland, N.,' The lowest of the minima occurred during the earlier half of the week, and were as low as 35° in 'Scotland, W.,' and 39° in 'Scotland, E.,' but exceeded 40° over the greater part of England, and were not lower than 51° in the 'Channel Islands.'

"The rainfall was in excess of the mean except over 'England, S.W.,' the 'Midland Counties,' and 'England, N.E.,' where there was a deficiency. On the extreme west coasts of Ireland the fall was very large.

"The bright sunshine was greatest over the 'Channel Islands' and 'Scotland, E.,' but was slightly deficient over England. The percentage of the possible duration ranged from 54 in the 'Channel Islands,' 48 in 'Scotland, E.,' and 41 in 'England, S.W.,' to 34 in 'Scotland, N.,' and 32 in 'England, N.E.'"

CARNATION FUNGUS: F. G. Burn the affected leaves, and spray the plants with liver of sulphur $\frac{1}{2}$ oz. to 1 gal. of water.

CATERPILLAR: Miss Turner. The caterpillar on the Gloire de Dijon is that of the "Vapourer" moth (*Orgyia antiqua*), now seen so commonly in the streets of London. R. McL.—W. J. L. The caterpillar of one of the Hawk-moths, *Sphinx*. We do not know which.

CRIMSON RAMBLER: G. R. H. We have a good plant on an iron arch, and do not find the iron injurious.

CUCUMBER: J. L. The insects are millepedes, and very injurious. You could trap them with slices of Potato, or scatter some soot on the soil. A. W. C. The appearances seem to indicate eel-worms at the roots, but the material sent is insufficient. The soil is very deficient in manure. M. E. Eel-worms in the root. They abound in the soil, which should be baked before using. Burn the affected plants.

CULTURE OF ODONTOGLOSSUMS: C. W. K. Sphagnum on Odontoglossums. The free growth of the Sphagnum-moss is generally regarded as an indication that the house and treatment are suitable. Up to a certain point it is very beneficial to the plant, but when it becomes so deep and dense as you describe, it is best to clip it back to the original level, i.e., whenever it begins to cover the young growths. Small though the crop may be, it may be used for mixing with fresh potting material. Sphagnum from some localities is very much more inclined to grow in this manner than that from other parts of the country.

CYCLAMEN COUM: H. F. Your roots are not diseased. The roots are storing up food for future use. The flowering period may be delayed, but the plants, if let alone, will multiply. Wait in patience.

"DOUBLE BUNCHES" OF GRAPES: A Constant Reader. The judges at a show would be likely to regard such bunches as deformed, they being two shoulders of the bunch, with the tail-piece missing. No schedule that we know of has a class for double bunches of Grapes.

GLADIOLUS: C. E. and F. W. L. It is *G. cardinalis*, or a seedling from it. We are afraid the yellow spots are the young state of some fungus too young to be determined in its present stage. Send specimens later on.

GOOSEBERRIES: Ribes, Blackburn. You should send fruits and leafy shoots to some cultivator in a large way living in your own neighbourhood. It is not easy to name varieties from fruits only.

GRAPES: Vitis. The berries are badly shanked, and there are some appearance that point to the spot fungus, *Glæosporium laticolor* having attacked them. Shanking is due to many causes. It may be due to over-cropping for several years, which has lowered the stamina of the Vine; to excessive summer pruning; to loss of roots owing to a soured state of the border brought about by the stagnation of the drainage, or the lack of it. In October or earlier you should examine the border, and ascertain its condition, and that of the roots. It may be found necessary to clear out the old soil, and replant the Vines, or plant new ones. When you have examined the border, send us samples of the soil and of the roots. Cut out and burn all berries that have the "spot." Shanked berries must also be removed, being uneatable.

INSECTS DESTRUCTIVE TO IXORAS, CROTONS, &c.: J. Walshaw. The specimens sent are those of the American cockroach, *Blatta americana*, extremely common in the West Indies and the warmer parts of America. They were introduced to your plant-house with Orchids, &c., from those countries. Being at first no larger than ants, their presence is easily overlooked. They may be scared away by strewn powdered borax in their haunts or trapped in bottles sunk in the ground, or ordinary beetle traps, or killed by the various advertised baits.

LEAVES OF THE LIME BLACKENED: W. H. M. The leaves have been attacked by aphid and red spider, which have caused exudation of the sap, and a deposit of sooty matter. We do not find any living fungus.

LILY BULBS DISEASED: H. K. The bulbs are affected with the Lily-fungus, often figured and described in our columns. Burn the affected bulbs, and before planting others next season, spray them with Bordeaux Mixture. The disease is very intractable.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. McMillan. The double-flowered variety of *Rosa lucida*, called Rose-button.—A. F. Poa annua.—C. A. B. 1, *Rudbeckia Newmanni* of gardens; 2, *Harpallium rigidum*; 3, *Hemerocallis fulva*; 4, *Campanula rapunculoides*; 5, *Statice latifolia*; 6, *Saxifraga hypnoides*.—W. Thomson. 1, A grass, which we cannot name from the specimen; 2, *Rhus cotinus*; 3, *Cornus sibirica variegata*.—D. L. Specimen quite shrivelled and discoloured. It is probably *Olearia Haasti*.—X. Y. Z. No. 4, *Cattleya Eldorado*, light variety.—F. G. S., Bishop Auckland. *Dendrobium bicameratum*, a curious botanical species, not generally prized by Orchid growers.—M. R. 1, *Valeriana officinalis*; 2, *Alstromeria pelegina*; 3, a shrivelled specimen of *Clematis*; probably a garden form, or a cross from *C. coccinea*.—A Twenty-five Years' Subscriber. *Olearia Haasti*.—Shirley. 1, *Acer spicatum*, so far as we can tell from the leaves only; 2 and 3, *Acer eriocarpum*.—Sir Charles Wager's Maple.—Scottie. *Leycesteria formosa*.—A. L. *Orobanche minor*, introduced with the soil. The plant is parasitic on roots of a variety of living plants. Common in the warmer parts of the country.—E. J. C. *Asolepias syriaca*.—H. E. *Acanthus spinosa*.

PEAR LEAVES: G. M. The leaves are attacked by a mite of extremely small dimensions. We fear there is no cure, but next season you might try spraying with Petroleum Emulsion. The publisher deals with advertisements and financial matters. You should have addressed the editor.

PLUM: Q. R. We do not recognise the fruit, and imagine it to be a local variety. It is similar to the Orleans, but is rather bigger, less sweet and piquant in flavour; but being early, and a good cropper, it is worth looking after as a market Plum.

POPLAR GALL: S. W. E. A gall on the leaf-stalk of a Poplar produced by a gall fly.

ROSE AND LABURNUM LEAVES DISFIGURED: Lexden. Most likely due to the too ardent sun-heat acting on leaves probably wet with dew, rain, or water artificially applied.

SOLANUM: A. C. C. We find nothing the matter with your plant. Perhaps it may be a dwarf variety, if so, it would be useful.

TOMATO: H. The spotting is caused by a fungus *Cladosporium*. Burn the affected fruits, and spray the plants with Bordeaux Mixture, or with liver-of-sulphur, at the rate of $\frac{1}{2}$ oz. to the gallon of water. Avoid spraying the ripening fruits.

VINES: C. B. Carefully read instructions given in this column on "Shanking of Grapes," to *Vitis*. For Grapes to be unripe and green at this date, although started in March, seems to show that the amount of heat applied has been insufficient. Few varieties require more than six months to ripen off their fruit.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 27, 1898.

B I C T O N .

THE seat of the Hon. Mark Rolle, is near Budleigh Salterton, South Devon, and has for many years been famous for its success in matters pertaining to horticulture. Its arboretum also is of so complete a character, that to the student in these pursuits there are opportunities for inspection and comparison such as cannot be obtained in any private establishment in the United Kingdom. The number of genera and species now proved to be suitable to the soil, climate, and surroundings of this district is, indeed, large, and fresh additions are constantly being made. The success that has attended these ventures in days gone by is a good guide for fresh attempts in the same direction, and so in every part of this extensive domain plants and veritable trees are flourishing that to the new-comer, as he gazes upon them for the first time, fills him with surprise and increasing delight, for he has always associated the culture of these rare and beautiful forms with protection, such as glass structures afford, and treatment that is not always of the simple greenhouse.

The mansion is a very large and not very handsome brick building, a good portion of which is hidden by the glass erections placed on either side. Standing on high ground, with a broad open lawn in front, the house has a most imposing appearance. Grand views can be obtained of the English Channel, which is here about three miles away. Budleigh Salterton is the most important township in the district, and is a most charming spot, pleasantly situated in a valley facing the sea towards the south-east; it is much sheltered, and has a warm and genial climate. A pleasant terrace-walk faces the sea, whilst the pebbly beach is one of the most remarkable of any part of the south coast; the West Down Beacon, rising some 200 feet above the sea-level is a bold and prominent feature in the place, on which beacon-fires in recent and earlier times have announced to watchers at Haldon and other hills in the southern part of the county the joys of jubilee or of coronation, and in earlier days messages of importance from the sea.

Immediately on entering the Bickton gardens, the first thing to attract attention is the unrivalled avenue of *Araucaria imbricata*. Originally planted about the year 1843, there must have been a bold confidence on the part of master and man to believe these comparatively new and rare subjects would withstand the climate. They were certainly justified in their venture; and ever since the novelty, distinctness, and beauty of this drive in an otherwise purely English landscape, have been expiated upon with intense pleasure.

The avenue is 500 yards long, the number of trees on each side twenty-five, the space between each tree 50 feet, whilst across the drive and grass-space the distance is 38 feet from tree to

tree. A few of the trees have lost some of their lower branches, but many are grand specimens. I enclose a photo of one of the tallest (fig. 40, p. 154), which has attained a height of 55 feet, with branches right down to the ground. The average height of the whole of the specimens is 50 feet. Many of them have stems of considerable size. One recently measured at a foot from the ground, had a girth of just 12 feet.

Passing through this avenue, and turning to the left, we enter the gardens, and close by is the house of Mr. J. Mayne, the courteous and intelligent gardener. As befits a garden of so worthy a proprietor, I must acknowledge, and do so most heartily, that I found everything in the gardens, pleasure-grounds, glasshouses, and arboretum, in a condition that would give satisfaction to the most exacting.

My rambles occupied some hours, the distance traversed being by no means slight. Passing with Mr. Mayne into the glass structures, the first we entered were the Melon-houses: here the fourth crop were well ripening, the fruit being of good size, and beautifully netted. The sorts mostly grown are Sutton's Scarlet, which is exceptionally fine; Masterpiece, and Triumph. Each division as it finishes its fruit is cleaned, and fresh soil and plants are again at work, without any loss of time. In the portion lately occupied by Cucumbers were large numbers of *Calanthe Veitchi*; several pseudo-bulbs are grown in 5 and 6-inch pots; at present they are full of healthy growths, which will shortly be followed by stout pseudo-bulbs producing spikes 3 to 4 feet long. These Mr. Mayne always manages well, and finds their flowers very useful in the winter. The flowers of *Calanthes*, as I know, suffer much in the neighbourhood of large cities and manufacturing centres, fog and smoke together causing the blooms quickly to fade, and bring disappointment, so that many do not grow them as freely as used to be the case; but in Devonshire, as I have proved at Bystock, and here at Bickton, and in many other gardens, the flowers of *C. Veitchi*, when the best varieties are grown, are of an intense colour and unusual size, and retain their freshness right into February and March, it being no unusual thing for *C. vestita*, *Veitchi*, *nivalis*, &c., to be in bloom for a matter of three and four months. The later introductions, such as *Requiem*, *Williamsii*, and a number of others, are naturally later in blooming; and when these can be obtained so as to be grown in quantity, I venture to say that displays will be made down here of which *Calanthe* growers have little conception. Anyhow, *C. vestita oculata gigantea* ought to be obtained, and if treated well, so that its leaves were long retained on the bulb, it would flower with a freedom and vigour right into the spring.

Passing into the vineries, the first house, one with an inside border, had borne a good crop, a few bunches remaining giving evidence of this. Next a house of Muscats, the canes planted five years ago, were carrying a grand lot of fruit. Lady Downe's and Alicantes in another house were equally good. Presently we came to other vineries, and respecting one some interesting particulars were given us. This had been a Peach-house, and as such the trees had done well; but a vinery in the kitchen garden full of Lady Downe's and Alicante though bearing well, could not, on account of the absence of fire-heat, retain its fruit long after ripening, damp and cold caused so many berries to rot, that more than half were useless. It then occurred to Mr. Mayne to exchange the occupants, which accordingly was done five years ago. At the time of this operation the Vines were ten years old, and the Peach-trees several years older, but the removal had so little effect on each, that the next year a few fruits were carried by each Vine and Peach; and since that time they have done well, and borne good crops. The bunches generally hang till about the New Year, when all are cut, and preserved in the fruit-room in bottles, where they keep in good condition till May, and even June, in fact until the first crop ripens. The bunches on these canes just now are superb.

The old Pine-pits now came under notice; here in days gone by fruit in quantity and fine in size was grown. In fact, we have heard of some fruiting-plants being stood outside and the fruit ripened in the open. Well, with sunshine as it was when I took my notes, and a warmth of 90° in the shade the day before (July 17), I do not at all doubt the probability of such finishing process being carried on. At the present time many of the Pines are carrying good fruit, Smooth Cayenne being the variety chiefly grown. A number of others are coming on in various stages; all being grown in and plunged in tree leaves, with just a little litter and tan added to these.

In a portion of this pit a number of young *Crotol*s and *Dracenas* were growing well up to the glass, the pots also plunged in tree leaves; good growth and colour can be obtained here, better than in the stove proper, in consequence of the density of the climbers on the roof of the latter.

In this house were plants of *Dendrobium Phalaenopsis*, *D. chrysanthum*, just opening its golden flowers; *Zygopetalum Mackayi*, *Peristeria elata*, showing flower; *Calanthe veratrifolia*, *Cælogyne cristata*, *Nepenthes* in baskets, &c.; beside the usual class of plants met with in a house of this description. A large *Medinilla magnifica* ought not to be overlooked, nor a grand mass of *Rondeletia speciosa major*, fastened to wires on the roof.

In the frames near by, I noticed a quantity of the double-flowered white *Primula*, just ready for potting into 48's, in which size of pot they will flower during the winter. The cuttings were taken in May and rooted, then stood in the frames, and well they now look; which may be said of the *Poinsettias*. In pits adjoining, some *Cyclamens Butterfly* and *Vulcan* (Sutton's) were robust, and full of healthy foliage. These were raised from seeds sown last August, and having been kept growing, they will by November have formed dense masses. Fine rows outside came into view of the blue and white *Campanula pyramidalis* (Wythes' strain); these are just ready for use indoors. *Salvias*, *splendens*, *Betheli*, and *Pitcheri*, are also in quantity, with a number of the scarlet *S. rutilans*, for spring-flowering; *Libonias*, *Eupatoriums*, &c., and a large number of up-to-date *Chrysanthemums* grown for furnishing large flowers, were looking well. *Montbretias* in pots are found to be very serviceable, and a quantity of them are grown.

In a border close by were quantities of *Carnations* full of flower, among them being the old Clove, Mrs. Reynolds Hole, Raby Castle, Burn's Pink, and numerous others, named and unnamed.

The Camellia-house is just 100 feet long—not a modern erection. A bed runs right through the centre, in which are trees of many years' growth; others are growing in a narrow border at the back, and fastened to wires on the wall, whilst some are planted on the front, and trained up the front rafters and across the roof. So that the house is a perfect archway of shining leaves, with large bushes underneath at all seasons, and it is in the winter and spring a mass of white, scarlet, and striped flowers. At times, a large plant is cut down in order to induce bottom growth, and to give air and light to others, for the specimens having grown so freely, parts of the house are like a thicket. The show-house has on the roof large *Heliotropes*, *Niphetos Rose*, and *Clianthus puniceus*; the stages being gay with zonal *Pelargoniums* *Ballet Girl*, and *Rose of Castille* *Fuchsias*, *Salvia patens*, *Celsia cretica*, *Coleus*, *Trachelium coeruleum*, *Cannas*, and *Hydrangeas*; whilst over all were large plants full of flower, of *Humea elegans*. Here, amongst a few *Odontoglossums*, were several *Masdevallia Harryana*, flowering most freely.

Before entering the Palm-house we passed a wall on which the yellow Banksian Rose has been established for years, and every spring produces a most abundant lot of flowers. Adjoining this is a large plant of *Magnolia fuscata*, then blooming, its deliciously scented flowers betraying its presence.

The Palm-house is a large structure of glass and iron, in which were large Palms, Aroids, and Musas; *Philodendron pinnatifidum* being a very fine plant. Here were two *Areca Baueri* 30 feet high, *Dracena latifolia* very strong; a fine *Caryota* 25 feet high; and

masses of *Alpinia nutans* now in flower. The back wall was covered with Citrons, Guavas, Hibiscus, single and double-flowering varieties; as well as the large-flowering *H. Lamberti*. On the narrow front border were numerous *Streptocarpus*, and *Begonias* of the fine foliage section. On the roof were plants of *Passiflora racemosa*, with numerous scarlet flowers and purple threads; and close by *P. Loudoni* also, with scarlet flowers, just a shade lighter, the threads in this variety being a clear white. Leaving this house, we pass large bushes of *Aloysia citriodora*, *Chimonanthus fragrans*, bearing many seed-pods; *Cassia grandiflora*, *Lonicera semperflorens*, and *Trachelospermum jasminoides*, full of its pure white flowers. *W. Swan, Exmouth.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

VERONICA DIEFFENBACHII.*

WE are indebted to Mr. Lindsay, of Kaimes Lodge, Murrayfield, for a specimen of this very rare *Veronica*. It is a hardy shrub, about 2 feet high, with thick, leathery, oblong-acute leaves (fig. 41). The flowers are in axillary spikes, and of a lilac colour. It is a native of the Chatham Islands.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT DULCOTE, TUNBRIDGE WELLS.

GREAT has been the improvement in this beautiful property, some five acres in extent, and most pleasantly situated on Broadwater Down, during the few years it has been in the hands of Walter Cobb, Esq. The owner is a man of great energy, and with the necessary amount of capital at his command he has carried out improvements about the place in the best manner. In the massive dwelling-house everything that the sanitary-engineer and decorator could suggest as likely to beautify and improve the healthiness of the building has been done, and in the gardens and pleasure-grounds neatness and order everywhere prevail.

The old plant-houses, excellently well built, but in most instances too lofty to accommodate the fine general collection of Orchids which was removed from the old establishment at Sydenham, have been utilised for the stronger and larger-growing species, and for suspending plants near to the roof.

For the *Cattleyas* of the smaller-growing rare species, and for the cool-house Orchids, new houses with all the accessories of extensive rain-water tanks and the best appliances for heating, shading, and ventilation have been arranged, and in these houses the plants are growing luxuriantly. Especially is this the case in the *Odontoglossum*-houses, where plants of several years' growth show increased size in their pseudo-bulbs and flower-spikes. In the first division of the chief lean-to cool-house, with some good examples of the *Pacho* form of *Odontoglossum crispum* in bloom, were several excellent types; also *O. Pescatorei*, *O. cirrhosum*, *Epidendrum vitellinum majus*, which grows at this place to a remarkable size, with very large and healthy foliage, the batch still in bloom having been flowering for the past three months; the pretty-looking *Ornithidium Sophronite*; the singular-looking *Zygopetalum stapelioides*; varieties of *Masdevallia Chimæra*, *M. bella*, and other *Masdevallias*; a number of the somewhat rare *Lycaste leucantha*, carrying a large number of flowers, the sepals of which are of an emerald-green tint, and the petals pure white; the ivory-white *Lycaste Cobbiana*, *Cochlidia Noezliana*, *C. vulcanica*, and *Sophronitis grandiflora*. In this house varieties of *Cypripedium insigne*, viz., *Wallacei*, *violaceopunctatum*, and *Chantini* grow very strongly, their

broad green leaves, in some cases, having a resemblance to those of *C. Rothschildianum*.

In the next division the front stage is filled with plants of *Odontoglossum crispum*, an importation of this year; but with pseudo-bulbs already plump and furnished with stiff, broad foliage, and in some few instances flower-spikes were remarked with sufficient flowers upon them to show that the varieties were worth retaining.

A noteworthy feature in the culture of the *Odontoglossum* here is, that crocks in the pots are dispensed with, and good drainage is secured by placing the rhizomes of bracken and rougher parts of the peat used in the bottoms of the pots. The plants so potted are light, and the method is said to be in every way preferable to the old method. At the end of the house, and on the highest part of the back staging, is a fine collection of species which Mr. Howes finds to grow well together, viz., *Odontoglossum Edwardi*, *O. ramosissimum*, *Oncidium zebrinum*, *O. macranthum*, *O. serratum*, and others of that class, which grow to

FIG. 40.—*ARAUCARIA IMBRICATA* IN THE GARDENS OF THE HON. MARK ROLLE, BICTON. (SEE P. 153.)

very large proportions, and most of them flower for the greater part of the year, the roof being partially covered with their flower-spikes. In the same house the specimens of *Cattleya citrina*, *Oncidium Forbesii*, *O. Marshallianum*, and *O. crispum*, are growing grandly—one large specimen of *O. crispum grandiflorum* having seven leading growths. From end to end of the houses, along the front, a rain-water tank is fixed, and beneath the back staging varieties of *Begonia rex* are planted, which grow to a very large size, and possess very handsome foliage.

In the smaller *Cattleya*-house are grown rare varieties of the showy *Cattleyas*, and suspended overhead a nice batch of *Cattleya aurea* with a few good *C. x Hardyana*, and one of a grand variety of *C. x H. Massiana*; also a small batch of *Lælio-Cattleya x Hippolyta*, of which the one certificated as *L.-C. x H. Dulcote* variety is by far the best. The small house situated at the end contains some good *Lælia purpurata* in sheath, and of *L. crispa superba*, and a few others in flower; also a batch of plants of the blue-flowered *Dendrobium Victoria Regina*, some of which had expanded flowers.

Taking the remaining Orchid-houses in succession, we noted in the first a capital lot of plants of deciduous *Dendrobiums* finishing up their growth, and with these a few sturdy ones of the rare *Oncidium bifolium*. To this succeeded a tall span-roofed house containing a fine lot of *Vanda Sand-riana* suspended from the roof, and growing splendidly, notwithstanding the fact that in winter the temperature is often as low as 50° to 55° Fahr. Here, also, are some plants of *Coelogyne Dayana*, with immense growths, and a number of plants of different species of *Phalaenopsis*. The next house, which is of similar construction to the last contained *Vanda suavis* and *V. tricolor*, with some *Cymbidiums*, including *C. Traceyanum*, on the centre stage; and on a shelf a good collection of *Miltonias*, and a very vigorous plant of *Pescatorei cerina*, which recently bore fourteen flowers; also a fine batch of *Epidendrum Wallisii*, and in flower some good examples of *Sobralia xantholeuca*, *S. leucoxantha*, *S. macrantha*, *Epidendrum O'Brienianum*, and some superb forms of *Oncidium Kramerii*. On a shelf near the glass in the next house were some fine masses of *Cypripedium niveum*, *C. bellatulum*, and others of that section, and suspended overhead were *Coelogyne cristata maxima*, *C. c. alba*, and other varieties; while in a shady corner stood a fine specimen of *Phaius tuberosus* with a dozen leading growths, which has had to be shifted from house to house several times before the present very suitable spot was found. The *Cypripedium*-house contains the best species and varieties, and "weeds" are rigidly excluded. On one side we noted a quantity of the pure yellow *C. insigne*, principally *C. i. Sanderae*, one of the specimens of which bears fourteen leading growths; and with these were *C. x Chapmani*, *C. x Gertrude*, *C. x Chas. Rickman*, *C. x Leysonianum*, *C. x Anna Louise*, and most of the best *C. bellatulum* hybrids. Of his own crosses, *C. x J. Howes*, a fine hybrid of *C. Sallieri*, Mr. Cobb thinks the best of its class; and his two newest acquisitions, *C. x P'Ansoni* and *C. x Mrs. Reginald Young*, both of which have secured First-class Certificates, are among those that he most cherishes. Many of the plants are now in bloom, and the house at this season is very showy. *C. Parishii*, a plant which formerly had thirteen flower-spikes, is still in bloom, as are some plants of *C. Curtisii*, *C. Stonei*, &c.

Passing an interesting array of seedlings, we came to a range of intermediate-houses, which hold a good show of *Lælia anceps*, of which there are several true *L. Amesianas*; some well-bloomed plants of *Zygopetalum maxillari*, *Oncidium curtum*, *Brassia Lawrenceana longissima*, *Lælia superbiens*, *Epidendrum Capatianum* and other *Epidendri*; *Cattleya Loddigesii* and other *Cattleyas*, &c. Other Orchids grown in quantity, and in fine order, were *Dendrobium Jamesianum*, *Miltonia Roezli*, *M. vexillaria*, and various species of *Anguloa*.

In the other plant-houses were many showy plants, well grown; in the open ground a grand lot of *Chrysanthemums*, many beds of *Carnations*, and other flowers, and on the outskirts of the lawn some splendid *Conifers*, from 30 to 50 feet in height. *J. O'B.*

THE PRINCIPLES AND PRACTICE OF PRUNING.

(Concluded from p. 134.)

AS regards the detailed pruning of a tree, this must be taken in hand at two periods of the year, viz., in the winter and the summer. In the former season the most important part of the operation must be performed, viz., that dealing with the older wood, with the training of the parts of the tree, and the more careful and accurate preparation for fruit-formation; for more can naturally be done during the dormant condition of the tree, when the sap is at rest, than during the summer, when life is active. In the summer it is more a question of general thinning-out, or suppression of the redundant green twigs, which have sprung up everywhere on the tree, as a result of the vigorous summer activity of the latter, which, throwing off the restraint of cultivation, tends to revert to its original ancestral condition.

* *Veronica Dieffenbachii*, Bentham, in *D. C. Prod.*, 8, and in *Hook. Fl. N. Zealand* (1843 to 1845).—Fruticosa glaberrima; foliis lineari oblongis subobtusis, basi parum angustatis amplexicaulibus; racemis axillaribus folio longioribus glabris; sepalis lanceolatis acutis, corollæ tubo brevioribus; capsula ovoidea sub-acuta, calyce sub-triplo longiore. Chatham Islands.

The following observations are concerned only with general principles, and will not usually, therefore, distinguish between winter and summer-pruning, the main features of each of which have respectively been stated above.

There are various of the more detailed processes in pruning which require really more knowledge, care, and tact than the untrained practitioner would at first imagine. For instance, in pruning-back a main lateral branch, this should always be effected close above a lower eye or bud, for the outgrowth from

from the latter will not only be considerably diverted from its right direction of growth as an even continuation of the mother-branch, but, as a result of this, will not draw the sap in such full and sufficient quantity to the fruit developing all along the whole branch. For it is obvious that along a straight or evenly-curved branch the sap will be more even in flow and more unchecked in quantity.

I have stated above that in the case of our hardy fruit-trees trained to walls or espaliers, it is dangerous to shorten the lateral branches, as this induces the

with the finger and thumb at a point near the base so as to leave them still attached and hanging from the injured portion. In this way they for a time draw a portion of the sap, which prevents the buds below from bursting forth, and yet does not detract to any appreciable extent from the supply of sap to the fruit spurs on the mother-branch. These hanging twigs at length gradually wither up, when they can be easily pulled off. If, however, the nipping of these green twigs takes place towards the end of the summer, say at the end of July or August, the likeli-

FIG. 41.—VERONICA DIEFFENBACHII: FLOWERS OF A LILAC COLOUR. (SEE P. 154.)

the latter, which is to form the continuation of the branch, will not tend so much to spoil the general curvature of the branch as would an outgrowth from an upper eye, for the cut surface immediately above its origin would be more quickly covered, owing to the fact that the tissues increase in thickness more rapidly on the upper than on the lower surface of a shoot, and thus the even continuity of the new outgrowth with the branch would be the sooner established. Moreover, the reason why it is always, in the case, at least, of these main branches, advisable to prune to an eye, lies in the fact that if a dead stump of wood be left beyond an eye, the outgrowth

production of too many woody twigs; this rule applies in a general way to all trees, but is less to be regarded in the case of pyramids, standards, &c., as attention has in these latter to be paid to the acquisition of the proper form, when some shortening of the lateral branches is inevitable; but this shortening partakes usually only of a slight character. But where shoots which are nipped or cut off low down, as in the vigorous green tertiary shoots formed in summer, are liable to break out again very shortly, and perhaps with as great vigour as before, it is advisable, though involving a little more time and labour, not to remove the shoots at all, but to twist them

hood of their again shooting out will not be so great (except in a wet season), for the activity of the sap's movement and the general vigour of the tree have passed their maximum, and a gradual decline of the life-energy has set in. Yet it is probably the better plan to undertake the summer pruning and training early on in the season, say in May or June, for the superabundance of green twigs being removed and the branches trained as far as possible into their proper positions, the sun, air, and rain-showers will have freer access to the tree all through the summer, which will be a most important factor in the formation of good fruit the same year, and in the ripening

of wood for the production of fruit the ensuing season.

As it is a fact that no two branches of a tree are alike in character, but that some are more vigorous in growth or more fertile than others, it follows that each branch must receive its own peculiar treatment, and that the same treatment must not be applied to all alike, as if the tree were a mere machine, for in a tree, as in everything else, true unity is always constituted by variety in its separate parts. If a branch is too rank as compared with the others about it, that is to say, if it tends to produce too much wood at the expense of fruit-spurs, its vigour must be diminished. This may be done either by leaving it entirely unshortened, so that the sap at length exhausts its exuberance in the natural manner throughout the length of the branch, with the result that the surrounding branches again equal it in strength, or the effective measure may be adopted of bending the too vigorous branch out of the perpendicular or obliquely-ascending plane into the horizontal, or, in the case of many wall or espalier trees, out of the horizontal into an obliquely-descending position, so as to induce the shoot to grow towards the ground. The more horizontally-inclined or decumbent is the direction of growth of a shoot or branch, the less vigorous will inevitably be its growth. In a horizontally-growing branch, for instance, the leafy twigs, instead of being more or less radially disposed around a branch as in an upward-growing shoot, will appear on the upper side only, where the fullest amount of light is to be obtained, and consequently the sap will be drawn principally to the upper side of the branch, resulting in a lop-sided development of the latter (a transverse section of the branch showing its upper side to possess a much thicker layer of wood than the lower); this uneven distribution of the sap and consequent one-sided development of the branch must result in a retardation of the growth in length of the branch and of its general vigour. The natural course of the sap is upward, and when this course is in any way disturbed or thwarted, weakness of the organ concerned must ensue. Hence, wall and espalier-trees with horizontally-trained boughs will be less vigorous in vegetative growth, and therefore adapted to produce finer fruit, than pyramids and other forms with ascending boughs, and, to take an illustration from our forest trees, the "weeping" varieties will always be found to be less vigorous than the type form. So that in Nature there are very few instances of plants with perfectly horizontal or "weeping" vegetative branches, for this is an unnatural and, as I have shown, a mode of growth unfavourable to the attainment of true vigour and the fulfilment of the proper life-functions.

Another method of reducing the rankness and strength of a branch is that of making in the lower part thereof a deep transverse incision reaching as far as the inner and older layers of the wood; in this way a considerable portion of the area of the pathway of the sap being interrupted (this pathway lying chiefly in the younger layers of wood), the nutrition and, consequently, the vigour of the branch will be very much lessened; but the incision being only on one side of the branch the sap will continue to flow, though in diminished quantity, through the branch, and after a time the wound will heal.

If, in an unfruitful branch, it is desired to induce the formation of fruit-spurs from dormant eyes, this may frequently be done by making an incision in the stem immediately below the eye, reaching as far as the wood but not penetrating the latter, or by entirely removing a circular area of the cortex all round the branch at that point; this practice is founded on the well-known fact that the elaborated sap containing the organic food substances, such as the sugars and proteids, assumes a descending course through the cortical and bast-tissues of the plant; these tissues, therefore, being removed below the eye which it is wished to force into a fruit-bearing twig, the substances above-mentioned accumulate here in great quantity, and cause the sprouting of the eye.

The same practice may be applied when it is wished to increase the size or improve the flavour of fruit

already in process of development, the incision being made below the fruit-spur on the mother-branch. It is to be noted that in these instances the ascending sap is quite unaffected in its course, the wood being left quite undisturbed.

Conversely, to those branches of the tree which are lacking in the necessary vigour, the process of shortening must be applied, as also the nipping off of the fruit-forming buds, and in this way the production of more woody growth will be induced, and a spur to greater vegetative vigour be given. Here again, the method may be applied of making a deep incision into the younger wood on one side of the main stem of the tree, just above the insertion of the branch which it is desired to strengthen; by so doing a portion of the ascending sap will be interrupted at that point and diverted into the branch, increasing thereby its nutrition and vigour.

There is a natural tendency in all vertically-growing stems for the upper appendages, as branches or flowers, to develop at the expense of the lower ones; this may be, in some measure, overcome by giving the branch at first a horizontal direction of growth prior to the natural ascending or vertical one.

In order to secure a proper development of the fruit, careful attention must be paid to the tending of the fruit-buds as they form; if the twig on which they appear requires shortening owing to its too woody extension beyond the buds, this must never be done until the buds are considerably advanced in the formation of the floral organs, for if the twig be pruned too early the fruit-buds might be induced to change their mode of growth owing to the great accumulation of watery sap in their immediate neighbourhood, and develop into vegetative shoots instead of into flowers; this, however, will not be possible when once the distinctive character of the organs enclosed in the bud are laid down, and the shortening of the twig will then act beneficially by increasing the quality and vigour of the individual flowers, and eventually of the fruit. I need hardly add that thinning of the buds or flowers will frequently have to be practised where the size of the fruit is a consideration.

In certain forms and kinds of fruit-trees, and by certain cultivators, as in Belgium and France, a systematic rejuvenating process is forced upon the tree, whereby, as the old stem or branches become unfit for fruit-bearing, they are, at the proper time and place, replaced by younger shoots, which themselves, at a future period, are in turn succeeded by others, and so on throughout a long period in the life of the tree. A young lateral shoot is carefully trained exactly parallel with the old one in such a way that at the proper time, when the latter is removed, the former may supply its place and function. By this method of perpetual rejuvenescence, as it were, of the tree, there is no doubt that a larger quantity and a better quality of fruit will be produced in a given time, and superior fruit will be obtainable for a longer period. But the very severe wounding treatment involved in this process must in the long run weaken the vitality of the tree. On the whole, it seems advisable to adopt less slashing and wounding, and more natural methods.

In spite of all that has been said in favour of pruning, many will, no doubt, assert, and with truth, that many kinds of fruit trees, if left entirely to themselves, and which never feel the knife or the support of the wall or espalier, will yet, even when young, produce an abundance of fruit year after year. Nevertheless, while not doubting this statement, the fact remains that, on the whole, and in the long run, trees which are carefully trained and pruned while young, will repay the grower by a more regular and abundant supply and a better quality of fruit than those trees which are left entirely to their own natural devices.

The fact that the old trees of farm and cottage orchards are observed to bear, year after year, an exuberance of luscious fruit of excellent quality is a natural result, firstly, of the probable early training and pruning of the trees when young and easy of manipulation; and, secondly, of the arrival at maturity of these trees when, the acme of their vege-

tative vigour and growth having been passed, and the ultimate natural form and size of the tree attained, this vegetative growth at length, in the fulness of the trees' maturity, has been equalled by that of the reproductive organs—the flowers and the fruit; this process resulting in the striking of an even balance between the two forces mentioned in the opening paragraphs of this article—the vegetative and the reproductive; a return to the more perfect ways of Nature being the result. And such trees in their maturity are always more beautiful to the eye than when, in their younger state, they are under the domination of the knife and the wall. The superior quality of the fruit in such orchard-trees, as compared with the wild crab-trees of a similar shape and mode of growth, and bearing an equal abundance of fruit, is due to their training and pruning when young, and all the other methods of cultivation throughout their life, and to their descent from an age-long cultivated ancestry.

The point more particularly to be insisted on here is that it is during the youthful active vigour of the tree, when the vegetative growth is at its strongest, and when naturally the tree is striving upwards to that maturity of size and form when it will be best fitted for the bearing of fruit, that this natural vegetative vigour must be firmly but judiciously restrained, side by side with other methods of cultivation, in order to the premature production of a superior quality of fruit both in the early and the later periods of the tree's existence; but the tree, having passed a certain age, and beginning to enter on maturity, may be left largely to itself to work out its own salvation in the attainment of an equilibrium between its vegetative and reproductive growth.

W. C. Worsdell, F.L.S.

THE NEW FLOWER GARDENING.

IN order to see the latest departure in flower-gardening, one must go to Regent's Park, where a complete system has been elaborated which includes a nursery in which hardy plants in immense quantities are cultivated; pits and houses for the production of tender plants, and also a store for ripening, drying, and preserving the thousands of bulbs which are used for decoration in early spring.

The principle pursued is to grow a great variety of plants, in large or small quantities as required of the most beautiful of hardy as well as tender plants; the season beginning in early spring, and continuing without interruption till late autumn. There is no waiting for effect, but when a bed is cleared of plants that have become bare of bloom, others in full flower at once take their places. Plants the most unlikely to remove safely are transplanted with no bad effects ensuing, as, for instance, in the case of Hollyhocks, of which an enormous number is cultivated, and all single forms. Some of these were pointed out to me immediately after transplantation, and in full flower, and after a lapse of ten days I again saw them, when they were in splendid condition. In the same way Celosias and Cockscombs that I saw growing in pits had been assorted as to colours and height, and were taking their place in the general scheme of autumn decoration. A large bed of Cannas in full bloom were conspicuous, where previously Pyrethrums were grown, and so the process goes on. In the nursery thousands of the best kinds of Starworts, of *Helianthus autumnalis*, of *Chrysanthemums* and other late flowering subjects, were found growing on, to occupy the position of those plants at present in flower in the garden.

A first inspection of this truly beautiful garden inclines one to at once conclude that its style and the system pursued are unsuitable for private gardens. But an explanation of the details, with a glimpse at the systematic manner in which the work is conducted, forces one to the conclusion that a clever gardener, backed by a liberal master, ought to be able to work out the details of this system with much assurance of success. It is no slight advantage that numbers of gardens are seen by their owners during only a short period of the year, and in such cases labour, which is an important consideration, would be not greatly

increased. While allowing so much, it must, however, be conceded that in general, extra men, extra ground, and a portion of glass set apart solely for the purpose of forwarding tender plants, would need to be provided.

It is, perhaps, unnecessary to refer in detail to all the beds, but only to the more conspicuous. Hollyhocks have already been mentioned. They are exceedingly beautiful, and of these the finest display is provided on a broad border which, with a hedge, divides the garden portion on the east side from the park beyond. Though a number of herbaceous plants, such as Oswego Tea and Rose Willow-herb, and others are interspersed throughout the border, the Hollyhocks are so lovely that they alone attract one's attention. In this and other combinations of a like nature, the Hollyhocks are arranged all over the border, from back to front, and thus it is, that they excel in beauty. A large oblong bed at the north end of the central row of flower-beds, has also Hollyhocks dotted all over it as the chief flowering plant, *Nicotiana affinis* and *Coreopsis tinctoria* filling the interspaces, and near the outer edges these are supplemented by *Heliotrope*, white *Phloxes*, and by a line of white *Marguerites*. Also in a large border bounding a group of shrubs on the west side, large irregular masses of single Hollyhocks are used most effectively. All the plants employed in this border are massed, *Antirrhinums*, *Celosias*, *Michaelmas Daisies*, *Sedum speciosum*, and the glaucous-foliaged *Elymus arenarius* being the more conspicuous. The above is a very effective piece of decorative gardening, and perhaps requires less labour than other arrangements that I noticed. The grouping of the shrubs, moreover, is signally good, and adds here, as in other parts of the grounds, very much to the general effect. Further north, on the same side, an irregularly-shaped bed, lying on a slope close to the junction of two walks, is also arranged in a most pleasing though, perhaps, singular manner. The groups of plants employed are arranged without regularity; they are unequal in height, though none is tall; the colouring is apparently without motive, and yet the effect of the whole is good in the extreme. Some of the plants grouped are *Campanula carpatica*, Chinese Pinks, white and blue *Lobelia* mixed, yellow and red *Nasturtiums*, also mixed in colours; yellow-leaved *Moneywort* trailing over *Stonecrops*, *Chlorophytum elatum variegatum*, rising from a carpet of blue *Lobelia*; *Francoa ramosa*, arranged in the same manner; Iceland *Poppies*, mixed *Verbenas*, mixed *Violas*, and *Echeveria secunda glauca*. A few dot-plants of *Araucaria excelsa*, and a mass of *Campanula pyramidalis*, lend the needed grace to this very attractive bit of uncommon bedding. On a lawn nearly opposite to this bed, one formed of succulents, charmingly arranged, gives a feeling of coolness where all is so very bright and gay.

Of the central groups of flower-beds, that planted with Hollyhocks has already been mentioned. Other beautiful beds include one of oblong shape, covered with *Viola William Neil*, thickly dotted with a rough-looking red *Carnation* named *Albert Durer*—this perhaps wrongly—anyhow, the effect was good. Two beds of tall *Fuchsias* filled in with smaller plants, and *Dactylis elegantissima* and scented-leaved *Pelargoniums*, were also pretty. A large oval bed filled with *Canna Alphonse Bouvier*, among which *Nicotiana affinis* was intermingled, and with a margin of *Marguerites*, gave a grand effect. A corresponding bed planted with an orange-flowered *Canna*; *Cannas* with dark foliage, *Abutilon Thomsonianum variegatum*, and the same edging plants as the last, was very effective. Here also was a very large bed of *Raby Castle Carnation*, with a carpeting of *Viola Mabel*, but in this instance the effect was decidedly tame. Other *Carnations* employed include *Germania*, a very fine yellow; *Miss Audrey Campbell*, not so good a yellow as the last-named; and *Yule-tide*, a dark-red *Clove-scented* variety that showed up well. *Cardinal Wolsey Carnation* was very poor, and is unsuitable for bedding. The same remarks apply to *The Pasha*, which is the least effective of the apricot-coloured varieties. The best of this shade is doubtless *Hampton*, free-flowering, and of a perfect habit of growth. *Hayes' Scarlet*, generally a difficult subject,

was here really very fine, and the colour brilliant; *Alice Ayres*, on the other hand, was dirty-looking. I admired the effect of a circle of double-flowered *Ivy-leaf Pelargonium Abel Carrière*, with flowers of deep rose, and a large bed of one of *Lemoine's* new *Begonia*, *Corbeille de Feu*, which was very striking, the general effect being bronzy-red. *B. semperflorens rosea* was also grown as a carpet plant, and *B. Afterglow*, with *Heliotrope* and *Lobelia* formed a charming combination. In addition to these, notice may be taken of small beds filled with *Montbretia crocosmæflora* and blue *Lobelia*, with *Zinnias* in various colours, with crimson *Celosias*, of various shades, and *Saxifraga hypnoides* for a carpet, with yellow *Celosias* and crimson *Coxcombs* mixed and interspersed with *Dactylis elegantissima* and with *Salpiglossis*.

The large vases were largely filled with *Ivy-leaf Pelargoniums*, supplemented with other flowering plants. All the vases were well done, and the plants with which they were filled in the most luxuriant health. The central group of *Palms* with a vase was delightfully arranged. In addition to these, a feature that must be noticed, is the well-arranged groups of shrubs whose branches in some places sweep the turf, in others they rise from groups of *Hydrangeas* full of bloom, or from among *Saxifrages* that have flowered. There is here a very large plantation of *Bambusa*, including *Arundinacea*, vigorous and doing well. *A. Simonsii*, very fine, and a light green foliaged species in the way of *Phyllostachys nigra*, but which is not known, are very fine. Dot plants of *Palms* of large size, and of smaller groups of *Bamboos*, are placed in position where their full effect can be best seen; while masses of *Polygonums* of most luxuriant growth, add not a little to the good effect of the whole.

Of the brilliancy of the zonal *Pelargoniums*, of the *Calceolarias*, and of many other common plants, it is unnecessary to do more than make mention. These, no doubt, strike one as being very well done, but it is to the uncommon and the surpassingly beautiful arrangements made with plants, some of which have been in cultivation for centuries, but the qualifications of which as decorative subjects have been hidden till now, that our sympathies go out. *B.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 79 to 85.)

(Concluded from p. 188.)

7, ENGLAND, N.W.

LANCASHIRE.—Apples are a full crop on the following varieties: *Grenadier*, *Golden Spire*, *Tower of Glamis*, *Ringer*, *King of Pippins*, *Pomeroy*, *Mère de Ménage*, *Dutch Codlin*, *Early Margaret*, *Pott's Seedling*, *Kentish Fillbasket*, *Malster*, and *Irish Peach*. Of *Pears*, *Jargonelle*, *Williams' Bon Chrétien*, *Doyenné du Comice*, *Beurré Diel*, and *Easter Beurré* carry fruits, but the crop is a very poor one. *B. Ashton*, *Lathom House Gardens*, *Ormskirk*.

— The Apple-crop in this garden is a heavy one, but generally in the district there is not nearly an average yield. The owner of an orchard 8 acres in extent, and situate 2 miles from here, assures me that except the berry-trees, his orchard has not been so bare for twenty years. Cold winds, aphids, and other insect pests have each done their share. *Wm. P. Roberts*, *Cuerden Hall Gardens*.

8, ENGLAND, S.W.

CORNWALL.—There was promise of an abundant fruit crop in this district, but during the blooming period heavy rain and hailstorms, accompanied by low temperature, spoilt all chance of a good Apple crop. As usual, the *Codlin* varieties are carrying a moderate crop; so also are *Alfriston*, *Loddington Seedling*, *Bramley's Seedling*, *King of Pippins*, and *Lady Sudeley*. *Pears* and *Plums* on wall-trees are very good. *Peaches* and *Nectarines* are poor, though in sheltered positions some trees are carrying a crop. *Chas. Page*, *Boconnoc Gardens*, *Lostwithiel*, *Cornwall*.

DEVONSHIRE.—In this part of Devon the Apple and Pear crops are very light. There are no *Lord Suffields*, and few *Lord Grosvenors*; *Warner's King*, *Cox's Orange Pippin*, and other sorts are doing fairly well.

The orchard crop, too, is very light. The thin crops may be accounted for by the fact that in 1896 and 1897 there were heavy yields, and last year we had a sunless autumn. *Geo. Baker*, *Membland Gardens*.

— Apple trees in cultivated gardens are carrying clean and good crops, but orchard trees have not so much fruit as the abundance of bloom seemed to promise. *Pears*, *Plums*, and *Apricots* are all that can be desired. *Peaches* promised well, but owing to the cold, sunless May the majority of fruits turned yellow and fell. *J. Mayne*, *Bicton*, *East Devon*.

GLoucestershire.—The Apple-crop in this garden is decidedly the best we have had for some years past. *Pears* bloomed magnificently, but the cold east winds and late frosts had a very prejudicial effect on the crop. *Plums* are a very partial crop; some trees have borne abundantly, while others have none. *Greengages*, *Jefferson*, and *Coe's Golden Drop* on walls are excellent. *G. W. Marsh*, *Arle Court*, *Cheltenham*.

MONMOUTHSHIRE.—There is an average crop of Apples, but the trees in some places are badly infested with blight. *Pears* are fairly good, the following comprising the best: *Williams' Bon Chrétien*, *Madame Treyve*, *Beurré Rance*, *Beurré Diel*, *Winter Nelis*, *Marie Louise d'Uccle*, and *Durondeau*. *Plums* are under average, the severe late spring frosts having had much to do with the failure of this crop. *Peaches* and *Nectarines* on trees against a south wall were very good, and required thinning. *W. F. Woods*, *Llanfrechfa Grange Gardens*, *Caerleon*.

— The following Apples carry good crops:—*Frogmore Prolific*, *Bismarck*, *Queen*, *Betty Gesson*, *Golden Spire*, *Worcester Pearmain*, *Lord Suffield*, and *Newton Wonder*. The most prolific *Pears* are *Durondeau*, *Louise Bonne of Jersey*, *Doyenné du Comice*, *Beurré Diel*, *Easter Beurré*, *Souvenir du Congrès*, and *Jargonelle*. Of *Plums*, *Victoria* is the only variety that carries a good crop. *Thos. Coomber*, *The Hendre Gardens*, *Monmouth*.

SOMERSETSHIRE.—We have had a very fair lot of fruit, and especially small fruits. *Strawberries* have been most abundant, *Royal Sovereign* taking the lead. Apples are a good crop in some instances. The cold winds and sharp frosts injured *Peaches* when the trees were in bloom. *Plums* are good in places. *Thomas Wilkins*, *Inwood House*, *Henstridge*.

WORCESTERSHIRE.—With the exception of *Plums*, the fruit-crops are fully up to the average, and the quality promises to be of a high standard. There has been the most persistent attacks from green and black aphides, which required the constant application of insecticides to repress, involving much labour and attention. Wall-fruit trees look promising, and bush and standard-grown trees have medium crops of healthy fruit. The worst of all our enemies to fight has been the Pear-midge, "*Diplosis pyrivora*," otherwise we should have had very heavy crops of *Pears*. *Strawberries* have been the crop of the season, especially *Royal Sovereign*, *President*, and *Latest-of-All*. *William Crump*, *Madresfield Court*, *Malvern*.

— Taking the fruit-crops on the whole they are quite satisfactory in this district. Apples are a good average crop of clean fruits. *Pears* are not so plentiful, but the fruits are good. *Apricots*, *Plums*, and *Peaches*, although in full bloom at the time of the "blizzard," I never saw set more thickly. The trees were merely protected with a couple of layers of fish-netting. The weather being quite dry at the time made all the difference between success and failure. *A. Young*, *Witley Court Gardens*, *Stourport*.

WALES.

GLAMORGANSHIRE.—The fruit-crop in this district is very disappointing, especially after the exceptional promise in the early part of the season. Apples are very scarce, many of the trees not carrying a single fruit. The most prolific varieties are, *Ribston Pippin*, *Warner's King*, *Dumelow's Seedling*, *Lord Burghley*, and several local varieties. *Pears* are better on the whole than Apples, but large numbers dropped, and some trees have a very thin crop. *Louise Bonne of Jersey*, *Forelle*, *Doyenné du Comice*, *Williams' Bon*

Chrétien, Marie Louise, Pitmaston Duchess, Glou Morceau, and Winter Nelis, are amongst the best. Plums are an average crop and clean. *R. Milner, Penrice Castle Gardens, Swansea.*

MONTGOMERYSHIRE.—There was no frost to injure the trees when in bloom, but all Apples are badly infested with blight, which is causing the fruit to drop. Among Apples our best croppers this season are Stirling Castle, Ecklinville Seedling, Bismarck, Tower of Glamis, Lord Derby, Lane's Prince Albert, Kentish Fillbasket, Pott's Seedling, Early Rivers, Mrs. Barron, and Golden Pippin; among Pears Glou Morceau, Beurré Diel, Marie Louise, Louise Bonne of Jersey, Marie Louise d'Uccle, Beurré d'Anjou, Pitmaston Duchess, Beaurré Superfin, and Doyenné du Comice. Plums are badly blighted, although they promised well. *John Lambert, Powis Castle Gardens, Welshpool.*

PEMBROKESHIRE.—The Apple crop is a failure in this district, owing to very wet, cold weather prevailing during the time the trees were in bloom. Apples on wall-trees have a splendid crop. Pears and Plums are poor, even the common Damson failing with us. The trees bloomed splendidly. *Geo. Griffin, Slebeck Park Gardens, Haverfordwest.*

9, IRELAND, N.

DOWN.—Owing to exceptionally fine weather during the early part of March we have a very good crop of Apricots, but, owing to heavy sleet and hailstorms, the Pear-crop is nearly a failure. Apples are abundant and of good quality. *Ed. Cole, Ballywalter Park Gardens.*

DUBLIN.—Apples and Pears are good, but stone fruits are poor and disappointing. All small fruits have been good excepting Strawberries. The season has been favourable to other garden crops, which are consequently looking well. *G. Smith, Vice Regal Gardens, Phoenix Park.*

LONGFORD.—Small fruits in general have been very good, especially Strawberries. Of these fruits Royal Sovereign cannot be beaten for size, flavour, and abundant cropping. I have many times gathered from ten to twelve fruits that were 1 lb. in weight, some of the individual fruits weighing 2½ ozs. *John Rafferty, Castle Forbes Gardens.*

LOUTH.—During the spring months there were strong easterly winds, with heavy falls of rain and hail. These destroyed the bloom upon Pear and Plum-trees. Strawberries have been very good, especially Royal Sovereign, Noble, and Latest-of-all. The only fault I find with the last-named variety is, that it does not colour well at the point. *Charles Pilgrim, Drumcar Gardens, Dunleer.*

SLIGO.—Fruit has this season turned out very good in this county. I was afraid in the early spring that the weather would ruin the blossom, but it was not so. Small fruits have been much over average, and the quality was excellent. *James E. Dawson, Lissadell Gardens.*

WESTMEATH.—The fruit-crops in this district are all fairly good with the exception of Plums (a total failure), and Gooseberries, which, although of good quality were scarce. Apples are a very fine crop, such standard varieties as Blenheim Orange, Cox's Pomona, and Lord Suffield, being loaded with fruit, and all growth is strong, clean, and healthy. *Robert Anderson, Waterstown, Athlone.*

WICKLOW.—Small fruits have been remarkably good this season, especially Gooseberries. Some of the standard varieties of Apples are bearing a full crop, such as Warner's King, Keswick Codlin, Ecklinville, and Worcester Pearmain; of the newer sorts, Bismarck, Lane's Prince Albert, and Schoolmaster, are carrying large crops of good fruit. *D. Crombie, Powerscourt.*

—April and May were wet and cold months. There were also frequent heavy hail showers, which destroyed the blossoms of early varieties of Apple and Plum trees, and caused the Pear crop to be, on the whole, a poor one. Crops of Gooseberries, Currants, Raspberries, and Strawberries have been extra heavy, and the fruits very large and fine. *James Whytock, Coolattin, Shillelagh.*

10, IRELAND, S.

CLARE.—Apples and Pears are not much grown in his district, and the orchards are neglected. It is a great pity, as Ireland is a fine country for Apple cultivation. *Wm. Clarke, Castle Crine, Six Mile Bridge.*

KILDARE.—On the whole the fruit crop is disappointing after such an abundant promise in spring. This is chiefly due to the severe frost on the night of May 15, followed by frequent east winds. Insect pests have been very troublesome. Apples on exposed trees have good crops, but sheltered trees, even of the same kinds, are nearly fruitless. *Frederick Bedford, Straffan House Gardens, Straffan Station.*

11. CHANNEL ISLANDS.

JERSEY.—The Jersey fruit crop will be a record one this year in point of quantity and quality. Cherry-trees suffered greatly early in June from cold nights, and lightning destroyed hundreds of trees, especially of the Morello. *Edwin John Ashelford, Queen's Road, Jersey.*

ISLE OF MAN.—The fruit crop upon the whole is a good one. Apples showed abundant bloom, but wet weather and hail-showers thinned it very considerably. Pears upon pyramids set badly, but there are immense crops and good fruit upon wall-trees. This has been a record year for Strawberries—heavy crops and fine fruit. *J. Inglis, The Nunnery House, I. of M.*

—The most reliable Apples here are Lord Suffield, Manx Codlin, Cellini Pippin, Keswick Codlin, Hawthornden, Cox's Orange Pippin, Beauty of Kent, Beauty of Bath, and Ribston Pippin. *Joseph Lloyd, The Gardens, Whitehouse, Kirkmichael, I. of M.*

EXPERIENCES IN FIG CULTURE.

It is surprising how large a quantity of fruit a healthy, well-trained and cared-for tree will produce in one season, when grown under glass. The most common method of training is that of fan-shape, and with due attention with regard to regulating, and the preservation of suitable sturdy fruitful growth, a good crop may well be relied upon. The Figs, however, enjoy plenty of extension to be fruitful, and when the room is somewhat limited, the roots must be repeatedly cut, otherwise the wood will grow coarse and soft. At Preston Hall I have repeatedly observed very heavy crops of luscious fruits growing on a tree which has been planted at the back of a lean-to house, and trained first up the back wall, and then in a downward direction to the roof. Whether by this method the tree is more fruitful or not I am unable to say; but one thing I was told—this individual specimen has cropped heavily for some years. Considering the Fig as a first-class dessert fruit, it does not always get the proper attention it deserves. The plants delight in a fibrous, loamy soil, with plenty of chalk or old, dried mortar incorporated with it, and manure-water at intervals if the fruit crop is a heavy one.

Under glass, if some of the young shoots are pinched at the sixth joint at intervals all over a tree, there will be plenty of fruit produced, and which will ripen for a lengthy period. Where Figs are highly appreciated, and there is no space of trellis available, some capital dishes may be obtained from plants growing in pots or tubs. As a rule, when the roots are somewhat confined, the growth is less gross and more fruitful with an annual top-dressing of suitable material. Repotting is not necessary every year; but when this operation must be done, I have found early autumn the best time of any to do the work. Frequently, if the trees are in a healthy condition, the pots will be crammed with strong roots. These balls of roots may be shaved off, and reduced in such a manner as to allow a good portion of fresh soil being rammed tightly round the pots and ball, seeing that the roots are thoroughly moist previous to disturbing them. Although a fairly good crop of fruit may be obtained from pots partially shaded with Vines or Peach-trees, to be highly successful a good position must be afforded the plants. As an all-round Fig Brown Turkey is simply excellent. Bourjassotte Grise, Negro Largo, and White Ischia fruit well in pots. *H. Markham, Margate.*

SHORT NOTES ON BULBOUS PLANTS.

(Continued from p. 136.)

FILICEA ORNATA.—A rare bulbous plant, resembling in its flowers *Hippeastrum vittatum* in miniature; it produces rush-like, channelled leaves, a foot long and a short flower-scape, bearing an umbel of three or four flowers, white in colour, with crimson stripes both inside and outside the segments; it has a small tubular, lobed, crimson corona, with crimson filaments and style, and a white stigma; each flower measures about 1½ inch across. It is said to be quite hardy, but I cannot verify this, the high prices ruling until recently hardly justifying the risk. It succeeds well treated as are *Zephyranthes*.

Griffinia dryades is an interesting and beautiful species of the "Blue Amaryllis." The flowers, about a dozen of which are borne on a stout scape, in the manner of a *Lycoris*, are pleasingly grotesque in appearance. The segments, with the exception of the lower one, are recurved, deep sky-blue in colour with white bases; the lower segment is quite straight and a trifle keeled, inside of which lie the stamens, the upper stamen in the whorl being parallel with the upper segment. This species is closely allied to *G. hyacinthina*, differing only in having pedicellate flowers. Imported bulbs of *Griffinia* are notoriously difficult to establish, sometimes remaining practically dormant for two years in stove temperature. They appear to do best with the same treatment as the *Eucharis* receives, keeping them moderately dry when they incline to rest, and affording a temperature of not less than 50°.

Hæmanthus Kalbreyeri.—This West African species is now flowering with me. It produces an umbel containing a large number of flowers, borne on a stout scape, inclining to a spherical shape, and about 6 inches across. The flowers are of a deep, rich red colour, and bear bristling yellow anthers, which give it a very effective appearance. Unlike the South African *Hæmanthus*, all the flowers in this species are individually displayed to the best advantage, the tips of the segments just touching each other. The bulb, scape, and leaf-stalk are spotted and mottled red. It flowers before making any considerable leaf-growth. It does best in a compost of sandy loam, mixed with about one fourth of its bulk of dried leaf-mould and basic slag in equal proportions; the latter should be fairly coarse. It must be kept dry when the foliage turns yellow, affording water at intervals of a few weeks to keep the soil from leaving the bulbs. Plenty of sunshine, and an intermediate temperature, suit it best while growing, which may be lowered to 45° while at rest. It may be propagated by offsets, or by seed, which should be sown as soon as ripe, disturbing the seedling as little as is possible for the first two years.

Brunsvigia Josephinae.—Of the few decorative qualities *Brunsvigia* possess, *B. Josephinae* may claim the larger share, its flowers being by far the largest and handsomest. The bulbs are about 1 foot long, and 6 inches in diameter, and are clothed with a thick, coarse tunic, resembling weather-beaten roofing-felt. The leaves, which die down before the bulbs flower, are distichous strap-shaped, rough and leathery in texture, averaging 3 to 4 inches wide, and 3 to 4 feet long. The flattened and glaucous flower-scapes are produced from the tops of the bulbs and average 2 feet in length, bearing umbels of from twenty to thirty deep crimson-tinted flowers on long glaucous pedicels, the pedicels partaking of the colour of the flowers for some distance toward the base. Each flower measures 4 inches across from tip to tip of the segments. The three upper segments are much recurved, the three lower ones being slightly depressed at first, but recurving completely as the flower ages. The colour and forms are variable in different bulbs, some showing lighter marbling inside the segments.

The bulbs should be started as winter approaches, in a temperature of 55°, affording plenty of water as the leaves advance, with occasional doses of manure-water, avoiding a very wet soil if the weather is dull and sunless. They should have completed their growth by the following April, and the leaves turning

allow at the tips will indicate this. When this is the case, expose them in the full sun on a shelf, or lay the pots on their sides in a sunny spot under a south wall when all danger from frost is over, allowing them to remain quite dry for two or three months; they may then be placed upon a coal-ash-bed, righting the pots, giving them occasional waterings till the lower-scapes appear. *B. Josephine* is very uncertain in flowering in this country, a very hot summer and very dry resting period being essential to success. The flowers being thick and fleshy, rains do not injure them in the least degree, and they last for several weeks in perfection. *Geo. B. Mallett.*

DIMORPHIC FERNS.

DIMORPHIC plants, or plants bearing two distinct types of leaves or fronds, are extremely curious and interesting, since in them, in one and the same axis of growth, we find the little formative cells constantly changing their minds, as it were, and adopting now one and now another structural plan. Doubtless, in most cases, this must result, or does result, from intermittent reversion in a variety or sport, to

fixed varieties in which only parts of fronds are affected, the medio deficient, or abasipinnula Lady Ferns, to wit, wherein the fronds are normal throughout, except that a few of the pinnules are reduced to thorns or entirely absent; in these, however, every frond is similarly characterised, and the dimorphism, therefore, is confined to the sub-divisions.

More curious cases are those in which the plant, as in our *Polypodium vulgare* var. *elegantissimum*, persistently sends up fronds of two extremely different types, one simply pinnate and perfectly normal, and the other finely cut into long, slender divisions. These diverse characters are not, however, necessarily constant throughout each frond, one or more normal pinnae or even pinnules may appear in a dissected frond, and conversely a single pinna of the other type may be finely dissected, and all the rest normal. This peculiarity is so fixed in this variety that all attempts to breed it out by selection have so far failed, and as we see by that remarkable Fern, *P. Schneideri* (a cross between this variety and the large exotic, *P. aureum*), it crops up in

and an æsthetic party constituting a county council with short tenures of office. In building a long street bit by bit, the rival architects would rule the roast by turns, and the result would be precisely akin, ornate gothic and plain brick and mortar being the picturesque (?) dimorphism evolved from the conflict. Dimorphism in Ferns is in many species associated with their reproductive peculiarities, the barren fronds being leafy, and the fertile ones more or less narrowed and contracted. Profuse fertility in spores is frequently obtained at the expense of leafy tissue; and conversely, very foliose or plumose forms are usually barren, or nearly so. In *Blechnum* and *Lomaria*, *Acrostichum*, and others, the fertile fronds are little more than midribs bearing the spore-heaps and their protective covers. In these cases we have simply a concentration of the reproductive forces in one set of fronds whose different form results therefrom; but even here the little cell architects are sometimes freaky, and in one of our varieties of *Blechnum* (*B. s. anomalum*) they evidently cannot settle between them what fronds shall be fertile, what barren, and so they have come to a compromise by building semi-leafy fronds, with little streaks of sporangia along their centres.

Thanks to the courtesy of Mr. J. W. Barnes, of Levens, the writer has received an extremely curious dimorphic *Scolopendrium*, remarkable even in that protean species for the great difference between the two types of fronds it bears, and the absence of any intermediate stages. Some of the fronds are quite normal except at the tip, where they form a handsome crest; the other fronds are perfectly linear, very long, and about a quarter of an inch wide—a merely ribbed rachis, indeed, with two incipient lobes at the base, and a spreading tassel of narrow segments at the tip. A still more curious feature is the fact that while the leafy fronds are normally fertile, the narrow ones are usually sterile. The two types spring from identical axes of growth, constituting it as thoroughbred a case of dimorphism as one could desire.

I insert here the following note by Mr. W. Marshall, Bexley:—"The accompanying plant is not a seedling, if it had been I should not have been astonished; as facts are, I must confess I am. Some seven or eight years ago I raised a batch of seedlings from a fine form of *S. ramo-digitatum*, or one of its first cousins (the naming of the *Scolopendrium* varieties is now so wonderful that I have given it up. I had a catalogue sent me the other day with six or eight pages of names of varieties, double columns); from among these one plant developed one frond of abnormal width and ramification, but barren, so I cut it off, and potted it up to its points. I got five plants—this is one. It started all right, then ran right out to the normal variety, and now has thrown a frond of var. *crispum*. What the next will be I am anxiously looking forward to."

This is a very singular case of multiformity in one and the same plant. The parent form of *ramo-marginatum* is so extremely distinct from the plumose or *crispum* section, that the latter is the very last form I should expect a sport from it to take; and the conjunction in the specimen of *ramosely-crested* fronds, a perfectly normal one, and a true but slightly *crested crispum* frond, is very interesting. (See fig. 42, taken from Mr. Marshall's plant.)

All cases of bud-variation are, of course, cases of dimorphism *pro tem.*, and subsequent partial reversion creates it again; but except in this case of bud-sports, to which our florists owe so much, dimorphism is hardly acclaimed a virtue by fernists or florists, since more often than not it means inconstancy, and detracts from, instead of adding to, the beauty of the plants. *Chas. T. Druery, F.L.S., V.M.H.*

NURSERY NOTES.

MESSRS. R. VEITCH AND SONS, EXETER.

NUMEROUS uncommon herbaceous perennials have appeared during the present season at these nurseries, which, with others seldom seen, have made the beds

FIG. 42.—A DIMORPHIC VARIETY OF *SCOLOPENDRIUM VULGARE*, RAISED BY MR. W. MARSHALL, BEXLEY.

the ancestral normal type, such variety not being fixed, and hence, just as the seeds vary and yield progeny of differing types, so the initial cells in the plants obey similar impulses, and do the same things. In Ferns the commonest examples are found in those partial sports known to Fern-hunters as "rogues," and in the male Fern these are by no means uncommon, plants otherwise normal sending up fronds which are forked or depauperated in an irregular fashion, as if they were trying to crest, but did not exactly know how. Generally the experienced eye detects this inconstancy, but it has occasionally happened that good hunters have been deceived, so successfully have the "rogues" played the confidence-trick upon them. In other cases, as in the "pulcherrimum" type of *Polystichum angulare*, plants showing the characteristic long sickle-shaped pinnules, which develop prothalli from their points, have been found, only to revert to the normal for years, occasionally, however, throwing out a pinna or two, and rarely a complete frond, as a tantalising reminder of the original prize. In such cases, the varietal forces are clearly latent, depending for their development upon some subtly congenial condition of growth which appears extremely difficult to determine. Dimorphism, too, plays a part in these constant and

a hybrid as it does in all mere crosses. In that lovely Lady Fern, *A. f.-f. Kalothrix*, precisely the same thing occurs in a less marked fashion, glossy, silky, finely-cut fronds being marred occasionally by pinnae or pinnules of a merely plumose type, from which *Kalothrix* originated. A very curious fact, however, occurs in this connection. A somewhat foliose *Kalothrix* has been raised, I think, by Messrs. Stansfield, in which the silky glossiness is preserved, but the cutting is less delicate. In this variety the reverted portions are normal, and not plumose, indicating that the *Kalothrix* form has reverted to the extent of throwing out the first varietal sport into plumosum while retaining the *Kalothrix* cutting of the secondary sport to a large degree. Spores of *Kalothrix* yield two distinct types of plants, the plain plumose type, and the true *Kalothrix*, with its little defects. In this case, as in the previous one of the *Polypody*, the tendency to become finely dissected must be a delicately balanced one, the votes of the architectural cells, so to speak, must be numerically close, so that when some little accident occurs the usual minority gets the upper hand for a while, and varies the plans of the opposition to suit their own taste. Just so could we imagine a common-place party

and rockwork very showy and attractive. I noticed the following when calling at the nursery a day or two ago:—*Eucryphia pinnatifolia*, a hardy shrub, was full of its large white flowers, reminding one somewhat of *Carpenteria californica*: this latter, however, is flowering under glass protection at present. *Ononis rotundifolia*, over 1 foot in height, with branching habit, bearing a quantity of bright red flowers; *Ononis fruticosa*, having flowers of a pink hue. *Lychnis vespertina alba flore-plena*, growing about 2 feet high, bearing large white flowers, which are double, as its name implies—a most useful form for cutting-purposes; *L. officinalis flore-plena*, with bright pink blooms; *Tupa salicifolia*, a most desirable plant for a sheltered spot, growing 4 feet high, and bearing masses of tubular scarlet and yellow flowers; *Helenium grandiceps striatum*—erect grower, about 4 feet high, with orange-coloured flowers striped with crimson; *Rudbeckia laciniata*, growing to a height of over 4 feet, is a useful plant for the back rows in borders, and in lightening up shrubberies—the leaves are prettily lobed, and the yellow flowers are of a large size; *R. pinnata*, with yellow flowers; *Hedysarum multijugum*, a flowering shrub having bright flowers of a purplish-crimson; *Acanthus mollis*, 3 to 4 feet high, bearing spikes about 18 inches long, of white and purple flowers; *Helianthus multiflorus maximus*, with very large, double, yellow flowers; *Statice latifolia*, a fine border plant with very large leaves, and immense panicles of purplish-blue flowers, useful for isolated position on the lawn, and very serviceable for filling vases and for house decoration; *Scabiosa caucasica*, a beautiful perennial, growing 1½ feet to 2 feet high, the flowers, which appear rather late in the season, being about 3 inches across, and of a soft lilac-blue, a most desirable species; *S. c. alba*, a white form of the above. In a rockery, a large plant of *Fuchsia corallina* is full of its bright crimson and purple blooms. *Notospartium Carmichaeliæ*—the New Zealand Broom that bears small, pink-hued flowers, singular looking and interesting; *Androsace lanuginosa*, another plant of singular beauty, which should be so planted on the rockery that its slender stems may fall over the stones—these pendent stems and leaves are coated with white silky hairs, and the flowers of a delicate purplish-rose. *Gentiana asclepiadea* is another pretty species with graceful shoots about 2 feet long, covered with purplish-blue flowers; *Geranium Wallichianum*, blue; *Meconopsis Wallichii*, a stately Indian species, growing 4 to 5 ft. high, very effective when planted as a solitary specimen, where its full beauty may fully develop; the leaves, of large size, are covered with yellow hairs, while the drooping flowers are of a pale blue colour. It prefers a situation where shade and moisture can be assured. *Physostegia virginiana* is a very fine plant, growing 2 feet high, with leaves resembling those of a *Chelone*, its pure white flowers being fine for cutting purposes. Numbers of other interesting plants are still in flower, rock plants, alpine, and herbaceous perennials forming a great feature here.

In beds close by these are numbers of choice *Cannas* planted out, which are just now in full blaze of beauty, among which *Bacchus*, Chestnut Yellow, *Geoffrey de St. Hilaire*, *Königin Charlotte*, *Phœbus*, *Souvenir d'Antoine Crozy*, *Stadtgärtner Sennholz*, are the more showy and free-flowering.

In a tank a number of *M. Marliac's* new Water-Lilies are growing in pots sunk in the water. These varieties have recently been so fully touched upon in these pages, that little further need be said than that every variety is kept in stock; and all are very beautiful.

The stock of Bamboos at this nursery is perhaps the most complete in the kingdom, as far as species and varieties are concerned, and many large specimens are to be seen here. *W. Swan.*

NEW INVENTION.

A NEW HOP-WASHING PLANT.

The old and expensive system of washing Hops by means of hand-pumps is likely soon to become a thing of the past. Mr. R. W. Thomas, of Rodmersham, Sittingbourne, has just invested in a steam-plant, made by Messrs. Merryweather, of London, under Merryweather & Corling's Patent, which, in efficiency and economy of working, is far ahead of any other system yet invented. It consists of a light portable steam-pump, supplying from twelve to twenty-four spray jets through portable iron pipes, with flexible joints and rubber hoses. The whole of the pipes

can be laid down ready for use in half an hour, and the pipes shifted by a few men to various parts of the gardens as required. The first cost is about one-tenth of a fixed plant, and the cost of working is about half that of the hand apparatus, while the steam-plant is also applicable for spraying fruit, corn, and vegetable crops.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Hardy Herbaceous Perennials.—These plants are becoming more generally cultivated, and in some gardens are ousting the tender exotics from their place of eminence in the flower-garden. When judiciously employed—that is, not made to fit into the intricacies of a geometrical-garden contrived for “bedding-plants”—their effect is everything that could be desired, besides affording suitable flowers in endless varieties of form and colour for use indoors. They may be planted in wide or narrow borders in round, oval, or oblong beds sheltered from the windiest quarter. The soil that suits most of the species is a rich loam, but that being rarely come-at-able, the beds should be liberally manured with good rotten dung, and be given a heavy dressing of loam. A border facing a shrubbery or a wall covered with climbing plants is not a good place, as the roots of these plants impoverish the soil, and deprive it of moisture. Borders, or a series of beds planted on each side of the centre walk of a kitchen garden, is a good place for them, especially if the kitchen-garden quarters are screened from view by ornamental hedges or espalier fruit trees. [We would advise those who may be contemplating the formation of a border or some beds of these plants, and are not well acquainted with them, to visit one of our leading nurseries at this season, and make a selection of the plants on the spot. Our space is too valuable to permit of a tithe of the fine plants available to be mentioned by name. Ed.]

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Winter-fruiting Cucumbers.—Plants raised from seeds or cuttings some time ago will now be ready for planting. Let the houses be made clean and sweet, and then place mounds of light rich soil, consisting of three quarters loam to one-quarter rotten dung, resting on a bed heated with hot-water pipes. After planting, place a stick to each plant, with one end in the soil, and the other reaching to the trellis, the plants being in a straight line near the front of the house, and from 3 to 4 feet apart. Afford water to settle the soil, and for a few days shade the plants from bright sun. Suitable temperatures are 70° at night; 75° by fire-heat in the day, with a rise of 10° to 15° with sun-heat. Ventilate when 80° is reached, and close early in the afternoon. Keep the soil moist, and damp the foliage in fine weather; at other times maintain a growing atmosphere by damping the floors and other surfaces.

The Pinery.—The potting-up of suckers taken from the summer fruiting-plants will now require attention, and the pit in which they are to be grown should be got in readiness for them, by washing the woodwork and glass, lime-washing the walls, &c. The old hot-bed of tan or leaves having become cold must be wholly or partially removed, and new materials put in its place, so as to secure a bottom-heat of 85°. Sometimes Pine-apples are grown by means of hot-water pipes entirely, and this is a very convenient method, especially when the plan is followed of laying a sufficient number of 2 to 3-inch pipes in a 2-feet thick bed of rubble, sea-pebbles, macadam, or the like, the plunging material being laid on this. The heat from a bed of this kind is more genial, moist, and better suited to plant-culture than the dry heat obtained from a heated chamber roofed in with slate, stone, boards, &c. A bed in which Pine suckers are grown should be so raised that the leaves of the plants are not more than 1 foot distant from the roof-glass when they are plunged. Whatever be the means adopted for affording bottom-heat, a heat should be assured that will last for six months without much fluctuation, and for that reason dung ought not to be used. In taking off a sucker, grip it firmly with one hand low down, and bending it outwards give it a sharp twist, removing it from the plant. The base of a sucker

should be made smooth with a knife, and a few of the lower leaves removed. “Sucker-pots” should be used, that is, pots 1½ to 2 inches deeper than their width, and of a size commensurate to the size of the sucker. If ordinary flower-pots are employed, 48's, 32's, and 24's are suitable sizes, and if new they should be laid for a few minutes in a tub of water. The pots should be drained with 1½ inch layer of crocks. The best sort of soil for suckers is light fibrous loam one year in stack, which should be pulled to pieces of about the size of pigeon's eggs, the finer particles of which should be removed with a half-inch meshed sieve; to this a quart of bone-meal and another fresh soot, and some charcoal broken small, should be added. If dry, the soil should be slightly moistened, and allowed to lie in a heap for a day or two in a warm place. Pot the suckers low down in the pot, and fill up with soil firmly to within 1 inch of the rim. If suckers are plentiful, secure more of them than are actually required, so as to be prepared for emergencies. Plunge the pots to the rim in the prepared bed, allowing space for growth. Until roots are formed the pit should be kept close, and shaded during the warmer hours. The suckers may be dewed once or twice a day, according to the state of the weather, no water being afforded in quantity till rooting-up has taken place to some extent. A suitable temperature at night is 65° to 70°, by day 75° when it is dull, with a rise of 10° with sun-heat. Suckers potted some time ago may have plenty of roots, and should be repotted in the same kind of soil as that recommended for the fresh suckers, and treated similarly. The hot weather makes it necessary to ventilate all divisions liberally, and to damp the floors and walls frequently, and as the loss of moisture in the soil is then great it will be necessary to afford the plants water more frequently, and also to damp the tan, leaf, or other kind of plunging material.

Succession plants approaching fruiting-size, if the pots are well filled with roots, may, as the weather becomes cooler, be afforded a reduced temperature and less moisture.

Fruiters will still need liberal treatment, and occasionally manure should be added to the water that is afforded the soil until the fruit colours. If it is a tan bed, and the heat has begun to decline, and the pots are much above the surface, some new tan may be added, sufficient to raise the bed to the rims of the pots. If more fruits are ripening than can be consumed, it is well to retard some of the least ripe by putting the plants in a cool vinery.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Coleus.—These useful decorative subjects may now be struck from the best coloured shoots, and when the cuttings are rooted, which takes but a short period of time, grow the plants slowly, so as to have sturdy plants to stand through the winter. Cuttings put in later than this date often strike unsatisfactorily, and are too feeble to be of value at that season. Let the rooted cuttings be examined weekly, freeing them from insect foes. Cuttings of *Coleus* should be struck singly in small flower-pots, placed in the propagating-frame, and when they are rooted they may be hardened off and then stood near the glass in a moderately warm house, the chief objects being a stocky growth and good colour in the foliage.

Begonias.—Those of the herbaceous-rooted section that were started early in the summer will have ceased to flower, and should be kept somewhat drier at the root, and when the top growth changes colour and falls over, water should be entirely withheld.

Ananassa sativa variegata, the variegated Pine-apple plant, when well cultivated is an object of striking appearance, quite equal to *Pandanus variegata*, and excellent for standing alone, or associated with others in a vase. The suckers should be left on the older plants till they are sufficiently strong to be taken off with a twist and a pull; afterwards root them in bottom-heat, in the same manner as an ordinary Pine sucker.

Stephanotis floribunda.—In order to ripen the growths of this plant, plenty of air and direct sunlight should be afforded, therefore a place very near the roof of the stove is a good place for it, and the growths should never be allowed to grow at will, but be kept straight and unentangled. Manure-water should be afforded for the next month or so, and then withheld, and the plants afforded cooler treatment. Very weak shoots should be removed, or, rather, spurred back, and clean water freely applied with the syringe, nothing being more effectual in keeping mealy-bug in check.

Allamandas, Clerodendrons, and Bougainvilleas.—Specimens of these species, now standing in cool houses, will, as the wood ripens and the foliage changes colour, require less water at the root, gradually applying less and less as the foliage matures.

Bertolonias.—If the stock of these pretty plants is insufficient, cuttings may now be rooted in sphagnum-moss and silver-sand in a close propagating-frame. As cuttings, the lat-rals are those mostly procurable, but a top may also be used as such. The Bertolonia winters more surely and safely in the young state than in the old, the larger leaves of the latter being liable to damp-off.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Platyclinis glumacea having finished growing, should be placed in a shady corner of the intermediate-house, very little water being needed at the root till growth has recommenced, but an occasional syringing overhead will keep the foliage fresh and green, and free from red-spider. The elegant *P. filiformis* is now flowering from its half-formed growths. It has to support a large crop of flowers, and to continue growth, it therefore needs water in abundance. Fresh compost may be afforded as soon as the flowers fade. When grown in a shallow pan, with a very thin layer of peat and sphagnum-moss to root in, and hung in a cool, shady position in the intermediate-house, this lovely Orchid grows to perfection with but little trouble. The chief foe to its well-being is red-spider, which, however, may be readily kept under. As a table-plant, *P. filiformis*, with its pendulous, slender racemes, is probably unequalled.

Miltonias.—The present season is the best of the year for repotting plants of *Miltonia vexillaria*, because the new growths that are now starting will soon produce from their base a number of roots. But before this work be commenced, make sure that the growths are free from yellow Thrips. If any be detected, dust a little sulphur or tobacco-powder well down into the growths; this will drive the Thrips from their hiding-places on to the surface of the leaves, and by the use of the XL-All vaporiser they may then be easily killed. *M. vexillaria* forms numerous fibrous roots, which push their way just over and under the compost, and for this reason a rather large and shallow surface of soil has been recommended for them; but after much experience, I find that a greater depth of compost is conducive to better results. The young growths rise stronger, and the leaves do not become brown at their points so quickly as they did in the shallow potting material. I select pots that are small in comparison to the size of the plants; drainage is given to about one-fourth of their depth, and instead of the usual crocks for this purpose, I use the thick pieces of the Fern rhizome taken from the peat when preparing it for use; the advantage of the rhizome being, that it makes the plant so much lighter than when crocks are used. Over the drainage place a thin layer of sphagnum-moss, and over this the compost, which should consist chiefly of sphagnum, a small quantity of fibrous peat, and crocks broken quite small. Elevate the plant a trifle above the rim of the pot, and work the compost well in amongst the roots; at the same time place a few thick pieces of crock or charcoal in the centre with the old roots, which will assist the drainage, and prevent sourness occurring in the soil. Potted in this manner, great care is afterwards necessary in watering the plants. For a time merely sprinkle the surface of the soil with a fine-rose watering-can, the principal object being to induce the sphagnum-moss to grow. Until the nights become chilly, keep the plants in the cool-house, and give them a position where they will obtain fresh air at all times. The late summer-flowering varieties, *M. vexillaria rubella*, *M. v. superba*, and *M. v. Leopoldi*, should be kept in the same house as the other species, a month hence will be soon enough to repot them. *M. Endressii*, and the distinct hybrid *M. Bleuana*, and its variety nobilior, succeed best in the intermediate-house throughout the year. Now that they are commencing to make their new pseudo-bulbs, copious root-waterings are necessary, and plenty of fresh air should be afforded them at all times.

Miscellaneous Species.—In the East Indian house many of the *Catasetums* and *Cynochos* are developing their flower-stems. Examine the plants every day, and if found to be the least dry, thoroughly water them. When the flowers have faded, and the growths are nearly made up, suspend the plants in the lightest position available, and give them as much fresh air as possible. So long as the leaves remain fresh and

green, keep them well supplied with water, but immediately they change to a yellowish colour, the amount must be gradually reduced. When the leaves have fallen, place the plants in a cool and drier atmosphere, in full sunshine. When the growths have been properly matured by such means, the plants will continue for a very long time without needing any water at the root. *Cyrtopodiums*, *Bletias*, *Thunias*, *Lissochilus*, *Mormodes*, and the deciduous *Eulophias* may be treated similarly. *Chysis aurea*, *C. Chelsoni*, *C. Sedeni*, *C. lævis*, and *C. bractescens* should now be removed from the Cattleya-house and placed in a stove-like temperature, where they will finish up their growths more quickly, otherwise there will not be time to mature their pseudo-bulbs before winter. The plants will require plenty of root-moisture until the leaves begin to change colour, when they may be returned to their former position in the Cattleya-house. It is now a good time to examine such plants as *Mesospinidium sanguineum*, *M. vulcanicum*, *Cochlidia Noezliana*, *Colax jugosus*, *Oncidium Marshallianum*, *O. varicosum*, *O. crispum*, *O. Forbesi*, *O. dasystyle*, *O. concolor*, *O. curtum*, *O. pretextum*, &c., and any that require to be repotted or re-surfaced may be attended to. The curious *Nanodes Medusæ* is now growing freely, and should be well watered every day.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Autumn-fruiting Strawberries.—Plants of *Vicomtesse Héricart du Thury* and *La Grosse Sucrée*, planted out for fruiting in the autumn, as advised in previous issues, being now in process of swelling their fruit, should be mulched with strawy-litter, first taking care to remove runners and weeds, and to make the plantations clean and tidy. It is probable that copious applications of water will be required once a week until the fruit begins to colour, and no longer. If wet weather should ensue while the fruit is ripening, the latter may be kept clear of the earth by placing twigs of Birch around the plants.

Tomatos.—The fruit on out-of-door plants is growing in size, and such of the plants as are carrying heavy crops should be afforded a liberal dressing of Thomson's Vine Manure. Stir the surface lightly after watering, and the chemical manure may be alternated with diluted farmyard-manure, but discontinue both when cool weather ensues. The leading shoot should now be stopped, as the fruits produced after this date cannot ripen. All lateral growths must be closely pinched off, but the principal leaves should be preserved entire, it being a mistaken practice to cut them off, or halve them; they may, however, be fastened back to allow the sunshine to reach the fruit.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

French Beans.—A sowing of the Osborne's Forcing or Syon House varieties should be made at about this date, in a brick pit capable of being heated, although no heat need be applied before the outside thermometer falls to 32° at night. At the time, however, when the plants come into bloom and onwards, a small amount of artificial heat assists them. Should such pit not be available the sowing may be made in 8-inch flower-pots, placing these outdoors and throwing some shading material over the pots to prevent loss of moisture from the soil, as until the plants appear no water should be afforded. When germination has taken place stand the pots in the full sunshine, removing them to a warm-house on the approach of cool weather. Another sowing may be made ten days after the first one. These late-sown Beans need good loamy soil, and generally liberal treatment from first to last.

Winter Vegetables.—All losses in the ranks of the Brassica crops should be made good by removing the strongest plants to be found in the seed-bed. Plants that are established, should be earthed-up without delay.

Lettuces.—Plantations of all ages should be kept quite free from weeds, and the soil moist and frequently hoed. Those Cos and Cabbage varieties intended for winter consumption should either be planted on a warm border, in rich, free soil, or in cold frames. First-class Lettuces have been difficult to obtain in the south for some weeks past, unless planted on north borders in cool soil, and then waterings have been necessary. Sow some more seeds of Brown Cos Lettuce.

Seed-sowing.—Seeds of Early London Cauliflower, Brussels Sprouts, and Early Cabbage should be sown on an open, dry border, for planting out next spring, and another sowing of Turnips made in rich, well-tilled soil; likewise Spinach, for winter use. Thin out the last sown Turnips when the plants show the first true leaves, and keep the bed copiously supplied with water whilst the drought lasts. The Spinach of the last sowing may need thinning to about 6 inches apart. Sow Rape or white Mustard-seed on vacant land, and dig it into the ground as green manure; it is excellent for the Potato crop.

THE APIARY.

By EXPERT.

Bees in a Ferret's Hutch.—A Soberton correspondent communicates the following incident in connection with the swarming of bees in his neighbourhood:—Mr. J. Silvester, of St. Clair's Farm, had some ferrets in a hutch near an outhouse; on Wednesday last a swarm of bees was seen to alight on the top of the hutch, but in the evening they had disappeared. During the three following days a few bees were seen buzzing about outside the hutch, but no notice was taken of them until Mr. Silvester, sen., was stung by one of the insects. He got a bucket of water and dashed it over all the bees that he could see, thinking to drown them. Then Mr. James Silvester opened the sleeping part of the hutch to clean the ferret's litter, and was astonished to find the swarm inside on the straw. They had been there four days, and had formed a good bit of comb on the top of the straw. Meanwhile the ferrets had slept under the straw each day, coming out to feed in the outer portion of the hutch, and returning without apparently disturbing the busy lodgers. They on their part did not attempt to sting or harm the ferrets. The latter have now been removed, and the bees remain in full possession of their novel hive.

Super-Clearers.—The advantages of using a good super-clearer, or bee-escape, when removing surplus honey are now so obvious and so generally admitted, that we need not waste time in detailing old plans which once took the place of this most useful of modern bee-appliances. Its use adds so considerably to the comforts of bee-keeping, that we will suppose every reader to have furnished himself with an efficient "clearer" of the "Porter" type, of which several good ones are now to be had. In removing surplus, the early morning or the evening, when work for the day is over, are the best times to operate. In the first case, the bees are cleared out by evening, and in the latter by the following morning. When using the Clearer, first gently raise the section-rack or super one-eighth of an inch by inserting the point of a screw-driver at each corner, and slipping in a thin wedge; then give just a puff of smoke at the junction of hive and super, and with a screwing motion lift the latter off, set it on the clearer—placed conveniently at hand—and replace the super with clearer below it on the hive. If an assistant be at hand to slip on the clearer when the super is raised, the job may be done in a moment, and the bees hardly be aware of what has been done. In order to have a few half-filled sections or frames left for extracting when the honey income begins to slacken off in earnest, it is well to remove such sections or combs as are sealed over from strong stocks, and replace them with partly-filled ones from less populous colonies for completion, reducing the amount of unfinished work on the latter, and adding warm coverings to the surplus chambers to guard against cold nights, otherwise there will be great risk of the unsealed honey being carried below into the brood-chamber. By judicious handling of partly-filled sections and frames in this way, and specially by keeping all warmly wrapped up during the closing days of the season, a good deal of the nuisance of half-finished bee-work will be avoided.

Prices for Honey.—We find from a return furnished to the *Beekeepers' Record* by the Statistical Office, H.M.'s Customs, that the value of the honey imported into the United Kingdom during the month of May, 1898, was £4433 of selling honey. There will be many inquiries for new honey, and as crops in the south this year must necessarily be small compared with those of the past two or three seasons, bee-keepers should ask a fair price for first produce. See that you offer a good finished section, put it up in a marketable shape, clean and glazed, and then you can command a fair price for the trouble expended in raising a crop of honey, besides feeling that there is some return for the anxious labour bestowed on the bees, and the long hours spent in the preparation of the surplus honey before it is ready for the market.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR SEPTEMBER.

THURSDAY,	SEPT. 1	—Maidenhead Horticultural Show.
FRIDAY,	SEPT. 2	{ National Dahlia Society's Exhibition at Crystal Palace (2 days).
TUESDAY,	SEPT. 6	{ Royal Horticultural Society's Committee; National Chrysanthemum Society's Exhibition (3 days); Durham Floral Society's Exhibition (2 days); Scottish Horticultural Association Meeting.
WEDNESDAY,	SEPT. 14	{ Royal Caledonian Horticultural Society Exhibition in Waverley Market (2 days).
TUESDAY,	SEPT. 20	{ Royal Horticultural Society's Committees.
MONDAY,	SEPT. 26	{ National Chrysanthemum Society's Floral and Gen. Committees meet.
THURSDAY,	SEPT. 29	{ Royal Horticultural Society's Fruit Show at the Crystal Palace (3 days).

SALES FOR THE ENSUING WEEK.

MONDAY,	AUG. 29	{ Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	AUG. 30	{ Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Lights, Glass Erections, Piping, Stock, &c., at Munster Lane, Fulham, S.W., by Protheroe & Morris (2 days).
WEDNESDAY,	AUG. 31	{ Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	SEPT. 1	{ Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	SEPT. 2	{ Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Imported Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—60.2°.

ACTUAL TEMPERATURES:—

LONDON.—August 24 (6 P.M.): Max., 71°; Min., 58°.

PROVINCES.—August 24 (6 P.M.): Max., 65°, Ipswich; Min., 53°, Off Shetland Isles.

ONCE more the great horticultural festival of the industrial classes has come and gone, and we return to our pleasant and we trust profitable task of endeavouring to estimate in some measure its effect on the improvement and advancement of horticulture, among the masses. Year by year we have hitherto had the pleasure of chronicling a continued advance for the One and All Flower Show, and although up to the very eye of the show we have heard the most diverse views expressed as to its dismal failure and transcendent success this year, we have felt pretty sure of a great success, such as we are pleased to write has now been realised.

The opponents of the show, and prophets of impending disaster, had some sturdy facts to rely upon, such as the genial spring in February, the cruel spell of suspended animation, rather than growth afterwards, the cold, late, and on the whole, and in most places, dry summer. Such could hardly be claimed as highly foster-

ing physical conditions for the seasonable and perfect development of luscious fruits, succulent vegetables, and flowers of faultless form, great brilliancy, and fullest fragrance. Hence, there was to be a great falling off in the number and quality of the exhibits, and consequently of the interest of the general public.

Before giving a few facts and figures as to the scope and character of the exhibition, which this year occupied the nave of the Crystal Palace, it may be well to give, in a sentence or two, the views of its sanguine supporters, who confidently predicted that the show would prove

plants and flowers. The vegetables ran to 455 exhibits, the cut flowers to 407, the pot-plants to 166, and the fruit to 155, many of these being collections. Two entries of farm produce came from co-operative farms.

The entire length of the two naves was filled, the north with the industrial, the south with those of professional gardeners and amateurs, the two together demanding a walk of 1½ mile to get a mere glimpse of the productions exposed to view. To assert that all the products were good alike would be to state what would be as impossible as untrue. To

PORTRAIT OF THE RIGHT HON. EARL GREY, K.G.

(President of the National Co-operative Festival.)

a better one than any hitherto held. And it may be here said that this National Co-operative Festival holds the same relation to the Agricultural and Horticultural Association as the Royal Agricultural Show holds to the Royal Agricultural Society of England. Be that as it may, there can be no question that the show furnishes a most opportune annual occasion for a practical, vivid, and far-reaching object-lesson to many, of some of the far-reaching results of the year's work.

The entries in the section for members of the Agricultural and Horticultural Association, and for professional gardeners, included choice varieties of hothouse fruit and greenhouse

assert that the amateurs products were equal to the professional gardeners, would be to understate one of the most gratifying features of this great show. Excluding such fruits as Grapes, Peaches, Melons, Figs, &c., and showing the same fruits, vegetables, and other products in the same numbers, the masses beat the professionals, or matched them in most things, except in Carrots, in which the more learned and cultured exhibitors beat the amateurs easily. But such friendly contests break no bones, and they do an immense amount of good. As a matter of fact, there was only one special prize open to competition to all, in either nave. But throughout the show the two sections, viz.,

VIEW IN THE GARDEN, ABBOTSBURY, NEWTON ABBOT, DEVON.

the professional and the industrial, were kept entirely distinct—thus, each exhibitor is enabled to compete with his equals in means, resources, &c.; but also, so far as may be, he is made to run abreast in social, climatic, and physical environment. Each division of the kingdom competes separately, so that North is not pitted against South, or East, or West. Entries come from all parts of the kingdom, excepting only the extreme North and Scotland.

The character of the exhibits is rapidly changing, though utility still holds a high place in the arrangements of the committee. Hence, there were over sixty complete collections of vegetables of six kinds in each for the workmen's section, and ten each for the professionals. There were also twenty-four entries of smaller collections of vegetables, so that the five hundred exhibits of vegetables alone would have made a complete show in itself. The separate exhibits of specific sorts of vegetables in the amateurs' classes exceeded those of the professional growers by four to one, and included every kind of edible garden product. Those who can recall the few dishes of Potatoes, Cabbages, Broad Beans, Onions, Parsnips, &c., shown by the working classes at the first and second "One and All" shows must be highly gratified at the enormous difference between the entries of twelve or thirteen years ago and those of to-day. In the amateurs' section this year Potatoes took a strong lead with two hundred and and thirty-nine dishes; different varieties of Beans followed with one hundred and forty-six; and of Vegetable-Marrows, almost unknown among the masses then, there were one hundred and seven entries. Onions, or, as one of the comic papers humorously calls them, Spanish beauties, to the number of eighty-six dishes; garden Turnips, eighty-three; garden Peas, seventy-nine, and most of them good; garden Beetroot, seventy-nine; Shallots, sixty; garden Carrots, fifty-six; Lettuces, fifty-three; Parsley, thirty-eight; Celery, thirty-five; Cabbages, thirty-one; Cauliflowers, twenty-four; Radishes, fifteen; Leeks, eleven. The silent revolution that has been effected in the food supplies and social habits of the toiling millions within the last dozen years are most vividly seen in the last two entries in the amateurs' class, viz., Tomatos, twenty-eight; Cucumbers, forty-three. The writer also saw on Saturday, an apparent artisan making a hearty meal out of two paper bags, one of sweet biscuits, and the other of red Tomatos, and has seldom seen anyone despatch a meal with greater zest.

In the professional section the vegetables mounted up to four hundred and fifty-five entries, cut-flowers to four hundred and seven, plants in pots to one hundred and sixty-six, many of them being collections. Fruit, single dishes and collections, numbered one hundred and fifty-five.

Fruit shown by the working-classes, considering the varieties of soils, sites, seasons, &c., was highly creditable. They staged one hundred and fifty-nine entries of fruits, of which twenty-four were cooking Apples, in two dishes of five each; thirty-four dishes dessert Apples—the finest lot of Apples seen this year; eight of Cherries, in dishes of fifty; twelve of Black Currants, in bunches of twenty-four, some very fine; nineteen of Red Currants; eleven of White Currants.

Nine collections of open-air fruit in four distinct kinds—thirty-six exhibits of Gooseberries, in two dishes of thirty each, mostly white and red, some very fine and large; two bunches of

Grapes, seven dishes of Pears, five of one variety; ten entries of cooking Plums, twelve in dish; sixteen entries of dessert Plums, twelve in dish. An ample dessert, though hardly so varied as we have sometimes seen them.

But we must hasten away from the obvious utility of such great shows to the cultural and educational value of such attractive object-lessons, in the teaching of the humanities among the masses. As we improve our food and flowers, we improve with them. It is a fact, now well proved by experience, that of the many better influences which may be brought into dull lives, and brighten while they arise, there is no influence of such perpetual interest and so easily accessible to all, as that exerted through the necessary assiduous care of flowering plants. By bringing these into our windows, back-gardens, and all bald and bare places, we provide new opportunities for relaxation, we stir deeper interests, and realise higher beauties than is possible by other means, sharing them with the man of means, and enjoying the same common pleasures in the successful pursuit of horticulture, fostering the virtues of forethought, patience, and perseverance. Even the joy of success seems thus more complete, as it is a victory rather over natural forces than over a brother or a sister whose needs may be greater than our own.

Neither is it only or chiefly that the quality of garden produce has been immensely improved within the last dozen years. But its nature and quality has been largely changed; at last we have found that the beauty and the fragrance, the tasteful disposition, the form, colour, and scent, of plants and flowers that have proved educating and refining for the rich, are equally so and even more needed among the industrial population.

At this show there were no fewer than twenty-seven baskets of flowers and collections of Roses; eight baskets and thirty-seven collections or bouquets of annuals; ten entries of table-decorations; sixty-three bouquets, vases, epergnes, by the wives and daughters of the members; and forty-four by their children. Among these there were some admirable examples of good taste. The entries of cut flowers from workmen's gardens numbered five hundred and four, and comprised Carnations, Chrysanthemums, Dahlias, Everlastings, Indian Pinks, Pansies, Mignonette, Petunias, Phloxes, Sweet Peas, Antirrhinums, Asters, Stocks, Salpiglossis, Marigolds, Zinnias, Lilies, Gladiolus, Godetias, &c.

Two hundred and fifty-seven pot-plants were shown in the workmen's section, and a wonderful advance shown in the culture of Fuchsias, Pelargoniums, Lilies, Begonias, Petunias, Musk, annuals in pots, &c.

Mr. EDWARD OWEN GREENING has little or no faith in a rest-and-be-thankful policy, and is constantly adding to the area and usefulness of this great show. Hence such special lines and prizes as consolation prizes, special prizes for local co-operative societies; from Mrs. HEMSLEY—so well known as Miss MARIE LOWE—of a picture painted by herself; from the Countess and Earl GREY, handsome shields and challenge cups.

Overcrowding is as great an evil in the garden as in the home. Not a few gardens and photos, large or small, are like pictures that you cannot see for the paint. There can be little pleasure in either picture gallery or garden without space, and restful shadow to relieve the brightness of the colouring or the light. A few small trees or flowering shrubs,

"a bonnie Briar-bush," bright flowers and green groups of Ferns artistically placed in a town or country garden, back yard, or dreary waste corner will go far to make them beautiful.

The following is the list of authorities who have done so much to ensure the success of this great show, viz., Mr. EDWARD OWEN GREENING again acted as Hon. Sec. of the Flower Show, and Mr. GEO. WAUGH as Director. The Chairman of the Flower Show Committee this year is Mr. DANIEL ROBERT SCRATTON of Devonshire, the President of the Agricultural and Horticultural Association. Mr. FRANK BELL acted as Assistant-Secretary to Mr. GREENING.

Earl GREY, accompanied by the Countess GREY, and their daughter, the Lady VICTORIA GREY, were shown through the floral show by Mr. ED. OWEN GREENING, Mr. D. T. FISH, and others, between 3 and 4 o'clock on Friday afternoon, and expressed themselves highly satisfied with what they saw. A sentence or two from Earl GREY's speech at the opening of the flower show, and that of the Bishop of RIPON at the opening of the industrial festival on the Tuesday, will fitly close our review of the event.

The Bishop dwelt on the three great principles of co-operation—1st, that society should be made up of one great body, and not of a number of warring atoms; 2nd, that fellow-workers should not regard one another as rivals; 3rd, that in their dealings one with another, they should have regard to a law of exchange and not be guided by selfishness. He further pointed out that it was the biggest blunder in the world to divide when there was the opportunity to unite, and therefore it seemed to him that the co-operative movement was natural obedience to a natural law.

Earl GREY in an able speech before declaring the flower show open, said that the object of the festival was to focus public attention, not on the commercial side of the co-operative movement, as that could very well take care of itself, but on such arrangements as would enable the million and a half co-operators to give fuller play to the side of their nature which found satisfaction in the cultivation and contemplation of flowers; in the rest and pleasure of music, in the intellectual stimulus supplied by literature, in the enjoyment of games, in the wholesome stir of athletic rivalry, and in the development of that spirit of individual independence, ennobled by the consciousness of a common brotherhood which had been the inspiring dream of every philosopher's Utopia. Earl GREY proceeded to sum up the ideal of the working-man in a terse sentence, leaving the impress of genius thus:—"Having secured a home of comfort and reasonable hours of labour, he and his family should have the opportunity, after working hours, of enjoying reasonable recreation, and that this opportunity should be obtainable at a cost within his means." We claim for horticulture that it is at once the cheapest, the purest, the most satisfying of human pleasures and relaxations.

[Our figs. 44 and 45, pp. 165 and 167, show selections made from the photographs shown on this occasion, and kindly placed at our disposal by the Association.]

SWISS HORTICULTURAL SOCIETY.—We have received the schedule of the International Horticultural Exhibition which is to be held in Geneva, under the auspices of the Swiss Horticultural Society, from June 14 to 20, 1899, inclusive. The President is M. MARC MICHELI, the Secretary M. JOHN WOLF, and Treasurer M. A. BAUDIN. The

exhibition will consist of plants, flowers, fruits, vegetables, and objects of art and industry connected with gardening. We will refer more fully to the items in the schedule at a future date.

"THE BOTANICAL GAZETTE."—The issue for August contains a *Comparative Study of the Development of some Anthracnose*, by BERTHA STONEMAN; together with illustrations of the disease. We are told that the investigations recorded in the paper were undertaken for the purpose of ascertaining by the growth characters developed in artificial cultures, the relationship of certain fungous diseases grouped under the common name of Anthracnose, and to determine, if possible, by a study of their life histories, the connection of these so-called imperfect fungi with perfect or ascigerous stages. We note remarks on *Gloeosporium frutigenum*, which attacks Quinces at Ithaca; then follow *G. phomoides*, the ripe-rot of Tomatoes; *G. venetum*, found on the Raspberry; *Hainesia rubi*, also found on the Raspberry; *G. musarum*, on the Banana, and other *Gloeosporiums*. Then we have *Colletotrichum Gloeosporioides* and *C. legendarium* on the Orange and Water Melon, and so in seriatim dealing with the species inimical to garden and orchard products, and garden trees and shrubs. We acknowledge the great assistance to the cultivator of these life-histories.

CANADA AND THE PREFERENTIAL TARIFF.—On Monday, August 1, there came into operation the new tariff charges—preferential, so called—as established between Canada, the United Kingdom, and all the colonies and possessions of the mother country—that vast agglomeration known to the rest of the world as the "British Empire." In these columns we cannot be expected to enter into full particulars relating to the nature and extent of these preferential tariff charges; but we may say that they—by the reduction of one-fourth of the tariff charges—naturally affect the position and prospects of the West Indies, &c. For the benefit of those directly interested in the matter, we may state that printed copies of all particulars are to be obtained from the High Commissioner for Canada, 17, Westminster Chambers.

NOVA SCOTIA.—The "Provincial Government Crop Report" for July, 1898, issued from the Office of Agriculture, Halifax, affords the intelligence that the outlook for the agricultural year, 1898, in that province is, upon the whole, satisfactory. With suitable weather the Oat and other grain crops will be better than usual, and the Potato crop promises to be slightly above a full average, and roots generally are full of promise. There is a notable increase in the acreage under Wheat in recent years. The fruit-crop, which promised to be very abundant in the flowering period, will fall far below early anticipations, as the returns from the fruit region of the Cornwallis Valley indicate. As in these islands, wet and cold weather succeeding the flowering season, prevented the proper setting of the fruit. It is curious to note that outside of the reputed Apple-growing districts the Apple crop promises better than usual.

THE WEATHER AND THE CROPS.—The weather during the past week has varied somewhat in different parts of the Kingdom. Throughout the greater part of England it was sunny and intensely hot, on Monday in London the shade warmth was 86°; but in some parts of Wales and Scotland there was a good deal of rain. Violent thunderstorms have swept over the west of England, Wales, and part of Ireland, doing a considerable amount of damage to crops, while the weather was hot and dry in most of the English counties. The work of harvesting has gone on apace in all but the latest districts, although the laid state of much of the grain-crops has rendered progress less rapid than it would otherwise have been.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE ET DE JARDINAGE."—This French edition of NICHOLSON'S *Dictionary of Gardening* has reached its seventy-fourth part, and is now nearly completed. To those

to whom the language presents no obstacle, we commend this edition, as containing much information not included in the original, and many woodcuts from the *Revue Horticole* and M. M. VILMORIN'S publications.

THE ROSNEY PEAR.—We read in American journals of a new variety of the Pear, a seedling raised in the Mormon territory at Utah. The fruit is described as of middling size to large, shapely, in colour a rich yellow, and crimson-blush on the sunny side. It is a fortnight later than Williams' Bon Chrétien in ripening. The agents for the sale of the variety in the Eastern States are the Phoenix Nursery Co., Illinois. On this side of the Atlantic we seem to have an excessive number of varieties that ripen in September and October.

ANNUAL OUTING.—We are in the very midst of the holiday season, and societies as well as individuals appear to be making the best of it. We have in our hand letters from the secretaries of the Fleet and District (Hants) Gardeners' Mutual Improvement Association, and the Lee, Blackheath, Lewisham, and West Kent Horticultural Society. Members of each of these estimable societies journeyed to Reading on the 18th inst., and were shown the principal features in the establishment of Messrs. SUTTON & SONS—their offices, warehouses, trial-grounds, and indoor flower department. From the tone in which both letters are written, it is evident that the parties had an excellent time at Reading—that, indeed, Messrs. SUTTON treated the visitors with their customary hospitality. Frequent visits to this and other like establishments has convinced us that a day so spent must be most useful to all intelligent gardeners, and is a capital means of blending instruction with enjoyment. Summer will soon have passed and holiday weather will not continue indefinitely. To all gardeners now holiday-keeping, and others, who look forward to a little relaxation in the immediate future, we extend our best wishes. May the time so spent the better fit them for another year's thought—and work.

THE PLUM CROP.—This important fruit, the crop of which is better than that of last year, is ripening rapidly with the forcing weather. What we have seen in the London markets are arriving in excellent condition. The tropical weather has enhanced the consumption of fruit, so that the demand has been lively. Lower prices may, however, soon begin to rule as the markets get glutted, few of the varieties grown in this country being suitable for drying, so that growers will be constrained to take what they can get for their crops.

ROBERT VON POMMER ESCHÉ.—We note with regret the death of this enthusiastic horticulturist, on August 5, from apoplexy. The deceased was an actual privy financial councillor, and provincial director of taxes, and the first director of the Prussian Horticultural Society, of which he was a devoted worker for a period of ten years.

PERPETUAL-FRUITING STRAWBERRIES.—The lecture on this subject by M. H. VILMORIN at the Drill Hall on Tuesday last was of much interest, and the plants and fruits from various exhibitors furnished visitors with an opportunity of noting the comparative value of the varieties recently introduced from the Continent. They are doubtless well worth the attention of gardeners in this country, and for the rest, there appears to be every probability that subsequent improvements upon them will be obtained. We hope we may look forward to having excellent crops of fine Strawberries in August.

FLOWERS IN SEASON.—Just when our southern Carnations have passed away, or are small in size, as are secondary flowers usually, we have received a box of magnificently-fresh and fine flowers from the country to which so many jaded southerners have gone in quest of a cooler, less enervating atmosphere. Messrs. LAING & MATHER, of Kelso-on-Tweed, state that all of these blooms have been produced out-of-doors upon layers planted in the borders last autumn. We

congratulate the firm upon the excellent quality of them. Some, at least, of the varieties are well known to us. The Pasha, a fine reddish apricot-coloured flower, with fringed petals; Queen of the Yellows, a yellow self of much merit; Primrose League, a pale yellow-ground Picotee, striped and spotted with purple and rose; Mephisto, a deep crimson self; Dundas, scarlet—one of the brightest scarlet Carnations we have seen, of large size and fine form; Magnet, a pale yellow ground, deeply edged and marked with rose; Mrs. David Dunlop, a pure white self; Scarlet Clove, a deliciously-scented scarlet variety of the Clove; Lady Nina Balfour, deep blush self; Viscountess Melville, dull crimson self of pleasant scent; Lady Waldie Griffiths, large, deep purple self; Mrs. Scott Kerr, yellow ground, curiously streaked with scarlet; and Kelso Abbey, buff ground, flaked with rose, petals somewhat fringed. These are the varieties sent us in such fine condition from Kelso.

THE PROPAGATION OF HYACINTHS.—In *American Gardening* for August 13, we have an excellent handling of the subject of the propagation of the Hyacinth, and incidentally of other bulbs, by "cross-cutting" and "scooping-out," both of which methods are rendered intelligible by means of illustrations. The writer of the article is a Mr. S. B. DICKS.

M. J. M. MONIZ.—The death is announced of J. M. MONIZ, known by his investigations of the natural history of Madeira, where he died on July 11, at the age of sixty-six years.

KILLED BY THE STING OF A WASP.—A labourer named CHARLES HUTCHINSON went into his garden at Kirby Muxloe, near Leicester, on Sunday night, and plucked a Gooseberry, which he began to eat. A wasp which had penetrated inside the skin of the fruit stung him at the root of the tongue. He went into his cottage and medical aid was summoned, but death ensued in five minutes.

APPLE ANDENKEN AN PALANDT (Souvenir of Palandt).—This new variety was brought into commerce by the firm of WESTENIUS successor, of HILDESHEIM, and named by the son in honour of his departed father, the well-known pomologist, PALANDT, and raiser of the variety. The fruit is of middle-size, coloured deep crimson and yellow, possesses a small core, a prominent eye, half-open or closed, and a thin stalk, set in a tolerably deep basin. The flavour is spicy and pleasant; ripe in November, and keeping good till March. The growth of the tree resembles Baumann Reinette. *Gartenflora*, August 15.

SOBRALIA CATTLEYA.—It will interest Orchid growers to know that this gigantic reed-like Sobralia, which has for some years grown remarkably well in more than one collection, but persistently refused to flower, is at last about to bloom in the famous collection of Sir TREVOR LAWRENCE, Bart., Burford, Dorking, in the care of Mr. W. H. WHITE. The bud, which is of the purple hue familiar in *S. macrantha*, appears on a stem proceeding from the side of one of the tallest growths, about 8 feet from the base, and 2 feet from the top of the stem.

EXPORT OF INDIA-RUBBER FROM THE AMAZON REGION.—The latest report of Mr. CHURCHILL, the British Consul at Para, which is the chief port to which the shipping of the Amazon resorts, shows that the greater part of the great rubber production of the Amazon region is exported from Para. In 1896 the value of this export from Para was nearly 3½ millions sterling, of which Great Britain took over 1½ million, nearly the whole of the remainder going to the United States. The quantity was 15,226 tons, the total export from the Amazon being 20,981 tons, the balance being shipped largely at Manaus, about 1000 miles up the river. The chief sources of production are along the great rivers and islands in the Amazon belonging to the State of Para, the valleys of the main tributaries of the Amazon, such as the Purus and Madeira, and the Amazon districts of Bolivia and Peru. Mr. CHURCHILL gives a long account of this remarkable industry in the Amazon region, its history, the mode in which it is now

carried on, the profits, the varieties of the gum, and the like. The most important observation he makes under this head is that the supply is regarded by competent authorities as inexhaustible, because the tree is being continually reproduced by nature. Some areas, such as Cameta, on the Tocantins, have become exhausted, but when abandoned for a time they recover, and many districts have not been tapped at all. The area producing Para rubber amounts to a million square miles, and further exploration will probably show that this is under-estimated. The richest zones at present known are along the banks of the southern tributaries of the Amazon, and on the islands in the main stream. Some of the northern tributaries have not been explored. Cocoa and Brazil Nuts are the chief exports after rubber, but

Insects of the year 1897, prepared under the direction of Walter B. Barrows, Consulting Zoologist of the Experiment Station, by Rufus H. Pettit. — *Queensland Agricultural Journal* for July, 1898, by authority. (Oceana Government Printing Bureau.)

SOME DEVONSHIRE GARDENS.

(Continued from p. 118.)

ABBOTSBURY (see Supplementary Illustration).—The leading feature of this place, which is snugly situated in the suburbs of Newton Abbot, is a very fine rock-

Conspicuous in this respect is *Zauschneria californica*, a good continuous-flowering plant, *Armeria rosea*, *Papaver nudicaule*, *Aster alpinus*, *Erigeron speciosus*, *Cheiranthus Dilleri*, *Aubrietia Leichtlini*, &c. Striking groups of Irises and *Spiræas* (*S. palmata*, *S. astilboidea* and others), with *Wahlenbergias* in variety, are scattered with profusion along the undulating margin of the basin. Standing boldly up are fine clumps of *Eulalia japonica*, *Spiræa gigantea*, and *Senecio japonicus*. Among the smaller plants are many varieties of *Androsace*, *Gentiana*, *G. verna*, *G. bavarica*, *G. septemfida*, &c., *Lithospermum prostratum*, and the like. In a very natural-looking cave are to be found *Hymenophyllum radicans*, *Cyrtomium falcatum*, with several other Ferns and Lycopods. Hugging the rocks is a fine group of *Ramondia*

FIG. 44.—A VIEW OF A TERRACE GARDEN AT BROOMFIELD.

(Exhibited in the Photograph Section of the "One and All" Flower Show by Fred Spalding, Chelmsford.)

they are of small importance compared to it; and although the region produced Rice of excellent quality it is no longer cultivated, as all the labour is absorbed in the rubber industry, and the people live almost wholly on imported food. *Times*, Tuesday, August 23.

PUBLICATIONS RECEIVED.—*Principal Poisonous Plants of the United States of America*, by V. K. Chesnut; Washington Government Printing Office. — *The Botanical Gazette* for August, 1898. Published by the University of Chicago, Illinois—*A Study of Normal Temperature and the Tuberculin Test*, by Charles E. Marshall, Bulletin of the Michigan State Agricultural College, Michigan. This deals with Bacteriology and Farm Hygiene, as applicable to the treatment of domestic animals.—Bulletins from the same station consist of *Fertiliser Analyses*, by R. C. Kedzie, Chemist at the Station; and *Some*

garden. It was laid out for the late Mr. E. Fisher by Robert Veitch & Son, of Exeter, and is at present under a temporary lease from his executors to that firm. It serves the double purpose of showing an extensive collection of rock and alpine plants growing under somewhat natural conditions, and of illustrating the beauties and attractive features of a well-planned rockery. The site, originally, was a flat meadow of about an acre in area, but by means of excavating in the centre and irregularly building up the sides, a picturesque tureen-shaped rockery has been formed, with cascade, shelving boulders, and a streamlet meandering over the shallow and rugged rocky bed to a length of about sixty yards, the width of the rock garden being about forty yards.

Approached from the higher end the effect is good, plants showing bold patches of colour, standing well out between the rocks, some perched high, and others just revealing themselves beneath the boulders.

pyrenaica, while on the soil just below is a good, bright patch of *Heuchera sanguinea*. The Cheddar Pink (*D. cæsius*), and several members of the *Dianthus* family, look very happy in their positions, while alongside of them are (in a boggy situation) *Dodecatheons*, *Cypripedium spectabile*, *Houstonia cœrulea*, *Primula rosea*, &c. Such plants as *Phormium tenax*, and others, of striking foliage, give a picturesqueness to the place, and are in fine contrast to carpet-like clumps of *Veronica repens*, *Thymus lanuginosus*, *Herniaria glabra*, &c. There are about 2000 species represented, and at the present time they are doing uncommonly well. The collection of new *Nymphæas* is a fine one, and includes some of Marliac's finest varieties, viz., *N. Marliacea albida*, bearing a profusion of very large white flowers; and *N. Marliacea chromatella*, which has bright, soft yellow flowers, with handsome foliage, spotted and marbled with bronzy-brown. There

are also planted some of the smaller-flowered varieties, such as *N. Laydekeri rosea*, *N. L. liliacea*, *N. pygmæa alba*, and others. They have all flowered very freely this summer, and have greatly beautified the pool. Still-water in a rockery may become an eyesore, but in this case the pool seems the natural complement to the overhanging rocks; and the bright colours of the Water-Lilies afford just the necessary ornamentation. A good illustration of the landscape-gardener's art is furnished by the cave and waterfall. The steps leading down to the cave appear to be hewn out of the rocky cliff, and are everywhere excepting the actual treads of the steps, carpeted with cushion-like plants, which seem to have grown there in the most natural manner. The walls of the cave itself has an irregular lining of shade-loving Ferns, and the tufts of *Scolopendrium crispum*, *S. c. fissum*, and *Selaginella helvetica* afford a cool and pleasant effect. Just below, and spanned by a stepped stone bridge, is a ravine, down which tumbles a very effective cascade of about 6 or 7 feet in width, with a fall of about 15 feet, and while being effective, it supplies moisture to the neighbouring plants. An effective specimen in this part of the garden is *Acaena ovalifolia*, which forms a verdure-clad veil of over 10 feet long, and half that in width. As a contrast to the brightly-coloured alpine around few, if any, subjects can compare with it.

By means of a zig-zag descent, a lower level is reached, and here dainty little groups of hardy species of *Cyclamens* thrive wonderfully, receiving the necessary protection from the sun's rays from some dwarf forms of Japanese Maples. Below this is the pond, which derives its supply of water from the cascade, and seems to be its most natural goal. The water emerges on the east side of the pond as a tiny streamlet, finds its way among the stepping-stones, and is finally hidden from view under a rocky ledge. The smaller plants on the low banks surrounding the pond are *Campanula G. F. Wilson*, *C. Waldsteiniana*, *C. garganica hirsuta*, *C. erinus*, &c.; *Primula Clusiana*, *P. Sieboldi*, *P. marginata*, *P. japonica*, *P. sikkimensis*, and others; while good clumps of *Papaver alpinum* in variety afford plenty of colour without appearing unduly heavy. The views are very varied, according to the different points from which they are taken. The plants employed have been selected with a view to obtaining an early effect, to be succeeded by a blaze of summer flowers, and that, in turn, by the rich tints of autumn foliage and flowers. *A. H.*

HOME CORRESPONDENCE.

SAXIFRAGA PELTATA.—I have just measured a leaf of *Saxifraga peltata* which I thought was an extra specimen—the leaf-stalk is $5\frac{1}{2}$ feet in length, and the leaf over 2 feet in diameter. There are others very similar, but this was the longest. It is much more gigantic than that described in the *Botanical Magazine*; it throws up flower-stems several feet in length. *Justus Corderoy.*

ACALYPHA SANDERII?—It seems, according to the *Revue Horticole*, that Mr. Brown, of Kew, who named the above most beautiful and interesting plant, which made such a sensation when exhibited by Mr. Sander at the Ghent Quinquennial Exhibition last spring, was mistaken in pronouncing it to be a new plant, as it is only *A. hispida*, described by Sir Joseph Hooker long ago as a well-known Indian flowering plant, and of which a coloured drawing, dated 1812, exists in the library of the Herbarium at Kew. Burmann describes it in his *Flora Indica* under the name of *A. caturus*, and it is also mentioned in a work of the same title by Roxburgh. Rumphius describes and figures it under the name of *Cauda felis*, or Cat's-tail. *W. E. G.*

BLACKBERRIES.—Whilst fruit and ordinary trees, and most of our field plants, seem to be badly needing moisture, the long line of cultivated Brambles that edge a shrubbery-border at Maiden Erlegh, Reading, and are trained up to a wire-trellis, 6 feet in height, not only look remarkably well, making fine summer growth, but are also carrying what promises to be a wonderful crop of fine fruit. It is interesting to learn in relation to these Blackberries,

that even before they are ripe, they are being asked for as dessert fruits. It seems as if, whilst some of the American varieties, as are found in Cliveden, need plenty of root-moisture, the pretty *Rubus laciniatus* prefers a dry, warm position. Evidently it needs warmth to induce the suckers to harden, and thus become fruitful. Some of the trusses of fruit on the Maiden Erlegh bushes are of great size. One of these flat-trained bushes, and not at all stiff or formal, but just loosely tied to the wire-trellis, is some 20 feet by 6 feet, covering the entire space, and when carrying ripe fruit will be quite a picture. It will be very difficult to produce any black-fruited hybrid that will prove more fruitful or more pleasant eating. The very fine clusters of the Kittatiny, which Mr. B. Wadds sent up to the Drill Hall in August last, were probably the best examples of the variety yet seen in England. These were the product of plants growing in strong, wet soil, where in the winter the water overflowed. Assuming that for what is the finest flavoured of the American varieties, so much of sunshine is needful, we find in that and the free-growing *R. laciniatus* very diverse requirements, which those who embark in Blackberry-culture should well understand. *A. D.*

TURNER'S CRIMSON RAMBLER ROSE.—Although this charming Rose is now well known, complaints as to its unsatisfactory flowering are not unknown. On visiting a garden in the neighbourhood of Woking a few days ago, the owner told me that notwithstanding his plants had been established for three or four years, he had so far been disappointed with its flowering. On examination the cause was found to be severe pruning. In my opinion pruning is scarcely necessary with this variety if much flower is looked for, and this is proved by the magnificent specimens at West Dean Park, Chichester. Mr. Smith, the gardener at that place, uses the variety for arches, and the plants form masses of bloom. *E. S., Woking.*

SCARCITY OF WASPS.—I was greatly surprised to read in your last issue a correspondent's remarks on the scarcity of wasps this season. We are literally swarmed with them, and this notwithstanding the fact that I have already destroyed fifty nests this season, besides numerous others that have been brought to my notice in the immediate neighbourhood. I might add, that I paid also for sixty dead queen wasps in the spring. The plague is not confined to this particular neighbourhood, for I have information that it exists in other parts of the county. The spring here was exceptionally cold, and one of the least favourable on record. We had no seasonable weather until July 2, when it became very hot, and remained so for four weeks; and I think it was from that period that the wasps increased so rapidly. My experience has been that they are not so venomous as usual, which I think may be explained by the dulness of the weather, for although it has been and is still very hot, we get no brilliant sunshine such as that in which the wasps appear to delight and grow strong. Although some hundreds of wasps have been caught in the dwelling-houses, few persons have been stung, and no one seriously. *Stanley Platt, Head Gardener, Loughcrew, Co. Meath.*

MONTBRETIA.—A bed of *Montbretia Pottsii* or *M. crocosmaeflora* has a charming appearance, and few other plants are so useful for cutting for house decoration. The two varieties named grow to the height of $2\frac{1}{2}$ feet, and possess *Gladiolus*-like foliage, of a pleasing bright green colour, and the flowers are borne on erect branching stems in profusion. *M. crocosmaeflora* has orange-red coloured flowers, and these are much larger and bolder than those of *M. Pottsii*, which is a hybrid. In arranging the flowers in vases, the most suitable greenery is their own foliage, with perhaps a few bits of the foliage of the culinary *Asparagus*. In water the flowers continue to open for several days. The blossoms may also be utilised with good effect for tracing on the table-cloth of a dinner-table, using the expanded flowers, and inserting them in triplets; and for button-hole bouquets, when wired, they are very attractive. Cultivation is very simple. Many cultivators permit their bulbs to remain in the same spot year after year, but this is a mistake, as by so doing the sun's rays cannot reach the soil where the bulbs lie, and as a result they do not mature thoroughly, and good flowering depends on their proper maturation. The soil for the plants should be trenched in the autumn or early winter, afterwards working in some farm-yard dung, and if the soil be heavy, it may be rendered lighter with potting-bench refuse,

sand, &c. The bulbs should be lifted in October or November, or when the leaves begin to decay, and planted in potting soil in cutting boxes, and be placed in a Peach-house or vinery near the hotwater-pipes. These in the natural course of things contain just that amount of warmth which the bulbs require to finish the ripening process. A cold frame or pit is a suitable place for the bulbs in the winter, taking care that they do not become wet. In the month of February they should be shaken out, cleaned and reboxed, and placed in a close frame and kept moist by sprinkling. When the bulbs commence to grow a dryer atmosphere should be afforded, and more air given, the lights being eventually left off altogether. In fine weather in April, the bulbs may be planted in the ground prepared for them in rows 18 inches apart, and 6 inches from bulb to bulb. *H. T. Martin, Stoneleigh.*

LACHENALIAS.—I have grown the above successfully and extensively for nearly fifty years until four years since, when disease attacked the bulbs. They are covered more or less with a brown-looking, shrivelled skin. I enclose a sample, and shall be glad of your opinion. I have taken various precautions; last year dusted the bulbs with sulphur, the year before soaked them in weak Condy's fluid. *T. T.* (See "Answers to Correspondents," p. 172.)

JUDGING FRUIT.—At an exhibition recently held in North Devon, a prize was offered for a "Collection of fruit, six dishes." One exhibitor staged black and white Grapes, one bunch of each on the same board, and four other kinds of fruits in plates, including, I think, Peaches, a Melon, Nectarines and Figs. Over this collection some discussion took place; the controversy arising from the fact that one of the judges contended that there were but five dishes of fruit presented. He would not admit that the two varieties of Grapes, on one board, could be considered as two dishes. A third party was called in, who also took this view, and as it came to be two opinions to one the exhibitor was disqualified, and a much inferior lot of six distinct sorts was awarded 1st prize. The schedule simply ran, "Class 98: Collection of fruit, six dishes." At a much more extensive and perhaps important show held in the same county during the past few days, class 45 in the schedule reads as follows:—"Collections of fruit to consist of ten dishes. In this collection two dishes of Grapes, white and black (two bunches in each) are required, but not more than one dish of any other kind of fruit allowed." In one prize collection I noticed on one board a bunch of Alnwick Seedling, and one of Madresfield Court; on another board a bunch of Muscat of Alexandria and one of Buckland Sweetwater, four kinds; on other dishes were a Pine, Melon, Peaches, Figs, Apricots, Cherries, Plums, and Nectarines, eight sorts. Was this perfectly correct? I wondered if the exhibitor had complied with the schedule in its entirety. Is it not usually considered that a dish of Grapes is two bunches of one kind? and can an exhibitor stage four distinct sorts for two dishes? It struck me on looking at this latter decision, that it scarcely corroborated that in the former case. The judges were not the same persons, but at both shows the same exhibitors were present in one or more classes. I should much like to know how one ought to act if such a collection came before them at any time, when called upon to officiate as judge? *Vitis.* [These difficulties arise from lack of clearness in the wording of the schedules. Usually a dish is taken to mean a distinct kind of fruit, and one kind only. *ED.*]

SEVERE THUNDERSTORM IN SOMERSETSHIRE.—A very severe thunderstorm, accompanied by hail of immense size, passed over this place on Sunday last, August 21. The glass has been much damaged. In some cases holes were cut through as if shot from a rifle, and the hailstones measured from 4 to 5 inches round. Such a storm, I believe, was never known in the locality before, and it will be long remembered. *James Webber, Dunster Castle Gardens.*

GARDENING CHARITIES.—As a regular reader of the *Gardeners' Chronicle* since my boyhood, I can well remember that you have at frequent intervals allowed your columns to be used by those interested in gardening charities to defend them against those who, from various standpoints, have assailed those excellent institutions. I think the greatest stumbling-block to these assailants seems to me to be that, with few exceptions, they look upon the institutions as benefit-clubs worked under wrong names. This, as has often been stated, is entirely wrong, for

I take it that these institutions are philanthropic, not benefit societies. Take, for instance, the Gardeners' Royal Benevolent Institution: it is kept going chiefly by voluntary subscriptions; and it is a fact that is well known, that, alas! the bulk of these subscriptions come from the wealthy supporters of the profession, and not from the ones who will eventually derive benefit, namely, the gardeners themselves. No one will, I think, contradict the statement of Mr. Fletcher, who in your issue of July 16, p. 53, says, the best thing is for everyone to help himself. This we know, is very excellent advice, but everyone cannot, or does not, help himself by laying by the store for a time of adversity or for old age. In many cases, and especially among gardeners, it is impossible to do so, and it is just this that the Gardeners' Royal Bene-

would have in the same ratio a smaller number of votes allotted; whereas a rank outsider would have none but the amount of support he can command among his or her friends who are subscribers. The Gardeners' Royal Benevolent Institution is undoubtedly doing a grand work, but from some talks that I have had with many intelligent gardeners, I think the work is not sufficiently known to be appreciated as it deserves. Much might be done by the committee, I think, in arranging meetings in connection with flower shows, &c., whereby its merits and objects should be explained and subscriptions invited. The gardening press has done an admirable work by permitting the discussions thereon, and the reports published therein, but still more could be done, in the direction of individual effort. *John Clayton.*

as strongly as ever. The first is, that it is an error in judgment to multiply classes. Leaving out of sight the summer Roses, we have already hybrid Perpetuals and Bourbons (the latter very few in number), Teas and Noisettes, and my contention has been that it would greatly simplify matters if these were separated into two classes, Hybrids and Teas; into the former I would throw all Roses having Bourbon blood, and those which are now called Hybrid Teas, leaving the Teas and the few Noisettes in a separate and distinct class, as they are now. My second objection was that it would lead to no end of confusion, and this seems to be more fully developed every day; the class was first formed by

FIG. 45.—A VIEW OF A WINDOW-BOX AT RICHMOND.

(Exhibited in the Photograph Section of the "One and All" Flower Show by C. Byrne, photographer. See p. 162.)

volent Institution has been trying to do for gardeners for years. To look at the question solely from an altruistic point, one of the best invested guineas that can be found even in this age of alluring prospectuses and gold-fields galore is for a gardener to become an annual subscriber to the Gardeners' Benevolent Institution. It has often been shown that the subscriptions of gardeners, if relied on for the continuance of the Institution, would be utterly inadequate to pay the pensions at present granted, without adding to the list. A point to which Mr. Fletcher seemed to attach great weight was the fact that subscribers for a certain number of years fewer than fifteen only received a "vote," or number of votes. Well, sir, at an election, votes are the only necessity, the point is to have plenty, and for a subscriber of eight or ten years the chances are greatly in his favour, from the fact of his having allotted to him a certain number of votes, in addition to all he can command at the election. A subscriber of a shorter period,

THE ROSARY.

HYBRID TEA ROSES.

I HAVE been often twitted by many of my Rose friends as to the position I have taken up with regard to hybrid Teas; and sometimes when the subject is mentioned, and some one of the class is much praised, a significant cough and a side glance at myself seem to imply—are you not very much ashamed of yourself? Of course, as in many cases, there is a misapprehension of my meaning, and I am credited with running down some very beautiful flowers when I have no intention of the kind; my objection to the introduction of this new class is not that I find any fault with the Roses, but that a new and separate class has been made for them. There are two things which I have always stated with regard to them, and which I still maintain

pitchforking into it Roses which had always been classed as Hybrid Perpetuals, and of whose origin in many cases the raisers knew but little. When I first saw *La France* at Guillot's, the raiser himself told me he had no idea of its origin; the climate of Lyons being favourable for the ripening of seed, Rose growers use to go into their plots of Roses, gather the hips indiscriminately, so that when the seedling plants bloomed they had not the slightest idea from what variety they had been gathered, or how they had been fertilised. But now each year brings us a number of additions. In some cases we are told how they have been obtained, but whether the operation has been carefully carried out, so that nothing else has interfered with it, we are not told. How often one is asked now, what is a hybrid Tea? and how difficult the answer! One has oftentimes to fence the question, and say, as

a great master of logic used to be fond of saying, "Definitions are dangerous things, and I would rather not give one." But now as to the confusion. I have just been reading in a contemporary two papers on the subject of Roses. They are carefully written; the first one is over the signature of "P.," and is entitled "Hybrid Tea Roses," and is a very exhaustive paper. In it he mentions La France as the first hybrid Tea, and he goes on to say that some years later Captain Christy made its appearance; but both of these were classed by their raisers amongst the Hybrid Perpetuals, as was also Lady Mary Fitzwilliam by the late Mr. Bennett. In the second paper, which bears no signature, and is under the head of "Good Garden Roses," the writer says, "One of the most surprising things in connection with the great Rose family is, how really few of the H.P. kinds generally are good garden Roses, that is, creating a show, and producing really good-sized blossoms also." After mentioning with praise Ulrich Brunner, the writer goes on to say, "Equally good in its way is Lady Mary Fitzwilliam, a prettily shaded flower, very full and pleasing to the last; another fine kind is Captain Christy, a Rose that rarely fails to produce a good crop of handsome flowers in a soil that is moderately light and warm. In some respects La France is excellent, though the habit is not so uniformly compact as in the kinds previously mentioned." Here, then, we have in the same page two writers, who evidently knew what they were writing about, describing the three Roses named, the one as Hybrid Perpetuals, and the other as Hybrid Teas, and is not this confusion, and is it not likely to muddle any one who is just beginning to interest himself or herself in forming a Rose-garden. I am quite aware this is a preaching in the wilderness, and that we shall have the pleasure of seeing many a Rose about which the raiser himself is not sure, put in a class where it ought not to have a place.

Ever raiser of seedlings is, I believe, conscious of the fact that although he may cross two flowers, it does not at all follow that the effects produced are his work, and the seedling flower they exhibit may show no sign of cross hybridisation. In looking round one's garden now, we can see at once what a debt of gratitude we owe to the Tea Roses for giving us such a feast of flowers in the autumn; many of the so-called Hybrid Perpetuals fail to gratify us in this respect. In some gardens, one variety will do so, and the grower may attribute it to some especial care that he has taken, but the next year the same plant may do nothing in the autumn. Of all the hybrid perpetual Roses, the one which I think is the most persistent autumn-flowerer is that grandest of all Mr. Bennett's seedlings, Mrs. John Laing. In all gardens, in all soils, and in all climates, it seems to be fully at home; and if one could only get an equally persistent autumn-bloomer of the colour of Louis Van Houtte, what a prize it would be!

Some very beautiful Roses have been recently added to this class of hybrid Teas, but I do not see that any loss would have accrued if such flowers as Kaiserin Augusta Victoria had been placed amongst the Teas, and Caroline Testout and Clara Watson amongst the Hybrid Perpetuals. A good many, but not all of the additions, come from France, but seeing the drift of things amongst Rose-growers here, they are falling in with the taste, and describe many of their Roses as hybrid Teas, which would formerly have been placed among the Hybrid Perpetuals. Most of these new varieties are vigorous in growth, some of them are not so; these, under whatever name they come, or however brilliant their descriptions, ought to find no quarter in these days.

Vigour of constitution is one point to be most earnestly insisted upon as essential to any new Rose. The National Rose Society has set a good example in this respect by requiring that not only the blooms of any new Rose exhibited for the purpose of obtaining the Gold Medal of the Society should be shown, but that a ground plant should also be exhibited; thus enabling rosarians to see what is the character of the plant as well as that of the flower. *Wild Rose.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 23.—That the fortnightly meeting of the Committees, held on Tuesday last in the Drill Hall, Westminster, was one of several that occur annually during the holiday season was very evident. The hall was not nearly filled with exhibits, and the number of visitors during the day was decidedly small. As the Chairman remarked after the lecture by M. Vilmorin upon Perpetual Fruiting Strawberries had been given, "London is not at home at the present time;" and visitors being fewer than usual, exhibitors are not so desirous to make a show. In August one does not expect a large display of Orchids, and on Tuesday we did not get them. Before the Fruit and Vegetable Committee, there were submitted several collections of fruit, including two from private exhibitors and an equal number from the trade. The only awards to novelties made by the committee were Awards of Merit to the well known Currant-Tomato, and to a new and deliciously flavoured early Apple named Langley Pippin. The former was from Chiswick and the latter from Messrs. JAS. VEITCH & SONS. Among a few miscellaneous exhibits were several samples from different parts of the country of the alpine and perpetual fruiting Strawberries. The Floral Committee recommended Awards of Merit to Gladiolus Madame Desbordes Valmore, to Hunnemannia fumarifolia, to Lathyrus grandiflora alba, and to Nymphaea odorata sulphurea grandiflora. There were collections of hardy annual and herbaceous flowers, a large display of Gladioli, a few stove and greenhouse plants, Bouvardias, and miscellaneous and comparative novelties.

Floral Committee.

Present:—W. Marshall, Esq., in the chair; and Messrs. J. Fraser, O. Thomas, C. T. Drury, H. B. May, R. Dean, G. Nicholson, G. Stevens, W. Howe, J. F. McLeod, R. B. Lowe, H. Selge Leonard, W. Bain, C. E. Pearson, J. Fraser (Kew), C. E. Shea, H. J. Jones, E. T. Cook and D. B. Crane.

Messrs. BARR & SON, King Street, Covent Garden, obtained an Award of Merit for Gladiolus Lemoinei, Mme. Desbordes Valmore, a bluish-tinted variety, with very distinct markings of brownish scarlet on the two lower segments. Messrs. BARR had also a fine display of general hardy flowers, among which the herbaceous Phloxes, Heleniums, Gladioli, Liliun elegans Batemanniae, Gaillardias, and Helianthus were conspicuous. The new yellow flowered Kniphofia lachesis was also observed in this collection (Silver Flora Medal).

Messrs. WALLACE & CO., Colchester, exhibited spikes of bloom of Gladiolus Madame Desbordes Valmore, which was recommended an Award of Merit, and a general collection of beautiful hardy flowers. These included a number of varieties of Lemoinei's hybrid Gladioli, amongst which the purple or blue flowered variety Sénateur Volland was noticeable. Some Gladiolus Brechleyensis, a few strong spikes of Kniphofias; also Liliun auratum platyphyllum, and other fine varieties of the Japan Lily, Hemerocallis aurantiaca major, and other species (Silver-gilt Banksian Medal).

Mr. Hudson, gr. to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex, who showed blooms of several Nymphaeas, was recommended an Award of Merit for N. odorata sulphurea grandiflora. The blooms were of large size, cream coloured, with golden centre. The other varieties shown included N. odorata rosea, and N. odorata exquisita, the latter being better coloured than the former.

Messrs. JAMES VEITCH & SONS were awarded an Award of Merit for sprays of the well-known Hunnemannia fumarifolia, with glaucous, much divided Eschscholtzia-like foliage, and bright true yellow coloured, single flowers with reddish stamens or anthers.

Mr. THOMAS S. WARE, Hale Farm Nurseries, Tottenham, made an exhibit composed for the greater part of Dahlia blooms, backed by bunches of various hardy flowers, including some fine varieties of Liliun auratum, Gladiolus, Liliun speciosum, &c. The Dahlia blooms were representative of the Cactus and Pompon sections, and were very bright in colour and good in quality (Silver Banksian Medal).

Bouvardias in a group of considerable size were shown by Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, London. These plants occupied one side of one of the long central tables, fully filling the whole length. The varieties included the well known Alfred Neuner, double white; Priory Beauty, single pink; Jasminifolios paniculata, Reine des Roses, Mrs. R. Green, pink; candidissima, President Cleveland, scarlet; Humboldt, white, with very large segments, also a grandiflora strain of this variety, the flowers as shown being appreciably larger than the type; Maiden's Blush, Alba odorata, jasminiflora, Dazzler, Purity, and Hogarth fl.-pl. In all there were about a score varieties shown. (Silver Flora Medal).

From FURNELL, FURNELL, Esq., Woodlands, Streatham Hill, came a group composed of tuberous rooted Begonias, Fuchsias, Ferns, Liliun speciosum, &c. Some of the Begonias were very fine, and the rest of the plants were suitable specimens for the ornamentation of the conservatory, sitting-room, &c. (Silver Banksian Medal).

Plants and blooms of a dull purple-flowered Carnation

were shown by Mr. JNO. EVANS, Darley Dale, Matlock Bath. It was named Winnie Webb. There was a number of new Dahlias before the Committee from Mr. GREEN, Norfolk Nurseries, Dereham, and other exhibitors, but no award was gained. Mr. GREEN, however, obtained an Award of Merit for Lathyrus grandiflorus albus, of which some fine specimens were exhibited.

Messrs. F. SANDER & Co., St. Albans, exhibited a group of plants of Acalypha Sanderi and of D. Godseffiana.

Messrs. H. CANNELL & SONS, Swanley, had a particularly pretty group of cut flowers composed of Salpiglossis and Scabiosas, with a facing of Gypsophylla paniculata, which, by the way, has never been used at exhibitions so freely as during the last two years. Salpiglossis, though they require rather more than ordinary care, are not seen nearly so frequently in the flower garden as they deserve to be. The varieties shown included flowers of pure yellow, intense purple, various shades of blue and curiously striped blooms of exceeding interest. The varieties of Scabiosas included alba, brick red, purple, purple azurea, and rosea. Some double flowered Gaillardias and excellent Cocks-combs in pots were also shown by Messrs. CANNELL (Silver Banksian Medal).

Messrs. JAS. VEITCH & SONS, King's Road Nursery, made another tasteful and uncommonly bright exhibit of cut annuals in competition for the Hurst Cup. The most noteworthy of the species shown were Scabiosas, Salpiglossis, single flowered Dianthus, the beautiful yellow flowered Hunnemannia fumarifolia, Schizanthus, Phlox Drummondii, Godetias, Gaillardias, Larkspurs, Coreopsis, Asters, &c. The exhibit was faced with Saponaria calabrica, and Gypsophylla muralis, a pink flowered species.

From Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. Bain), came a handsome exhibit of Gladioli. These represented varieties of G. Childii, G. Gandavensis, G. hybridus Nanceianus, and G. hybridus Lemoinei.—They were exceedingly beautiful. The spathes of hybrid Anthuriums, too, were very fine, and the blooms of crested Begonia interesting (Silver Flora Medal).

Messrs. KELWAY & SONS, Langport, Somerset, made one of their great annual displays of Gladiolus spikes. There were something like fourteen dozen spikes of bloom, all illustrative of the choicest varieties, some eight dozen being named. It was difficult to observe in the specimens shown any indication of the drought that has obtained recently, but no doubt the collections of these plants have suffered materially from lack of sufficient rain. The flowers were bold, bright, and as large as can be desired, whilst the varieties, though none were deemed sufficiently distinct for further awards, were very fine (Silver-gilt Banksian Medal).

Orchid Committee.

Present: A. H. Smea, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. M. Pollett, J. Gurney Fowler, H. J. Chapman, W. H. Young, J. Jaques, W. B. Latham, W. Cobb, and T. B. Haywood.

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. W. H. White), showed a magnificent specimen of Platyclinis filiformis, with over one hundred of its charming pendulous, slender racemes of yellow flowers—an excellent example of continued good cultivation, the plant having been shown every year in similarly good condition for some years. Sir TREVOR LAWRENCE also showed a plant of the rare Bornean Saccobolium Hendersonianum, with a strong, erect spike of carmine and white flowers, with crystalline surface.

NORMAN C. COOKSON, Esq., Oakwood, Wylam, Northumberland (gr., Mr. Wm. Murray), showed Cattleya × Hardyana "Oakwood variety," a fine home-raised form, with the bright tints and rich crimson-purple lip of the good forms of the imported type; also a flower of his Odontoglossum × crispohalli, a fine form, with cream-white ground, heavily spotted with chocolate colour.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed their new Disa × Clivia (grandiflora ♀ × Veitchiana ♂), a worthy addition to the list of good garden hybrid Disas, its flowers in size more nearly resembling D. grandiflora than any of the others. The four plants shown varied somewhat in colour, ranging from rosy-scarlet to purplish-rose (Award of Merit). Messrs. Veitch also showed the singular and pretty Epidendrum × radicans - Stamfordianum (Stamfordianum × radicans), which, like other crosses of E. radicans, adheres closely to the habit of growth of that species. The large terminal head of flowers was yellow, the sepals and petals and tips of the lip reddish-orange, and being spotted and freckled in a similar manner to E. Stamfordianum. Masdevallia × Circe (Veitchiana ♀, Schroderiana ♂), with a rather slender scape, bearing one flower and two buds, the flower orange in colour, with numerous purplish papillae, and in size nearly as large as an ordinary M. Veitchiana; and Cypripedium × Rothschildianovillosum, a singularly intermediate hybrid with yellow ground to the flowers, which bear on the sepals and petals some purplish lines, and on the face of the lip a rose-coloured hue.

G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr., Mr. Morris), showed Cypripedium leucocheilum Mooreanum, a very fine variety, with yellow ground, beautifully marked with purple, and somewhat resembling the fine form Certificated to R. I. Measures, Esq., as "aureum." Mr. Moore also showed two flowers of the Popayan form of Cattleya Trianae flowering at an unusual season.

Admiral Sir H. FAIRFAX, Priorwood, Melrose, N.B., showed a very fine form of Cattleya × Hardyana, and a noble inflorescence of Odontoglossum Harryanum, for which a Cultural Commendation was given.

Messrs. F. SANDER & Co. showed a small group, set up with specimens of their beautiful *Acalypha Sanderiana* and *Draecena Godseffiana*, and comprising the singular feather-lipped *Bulbophyllum barbigerum*, whose delicately-constructed flowers move in a remarkable manner in air currents; the large-flowered *B. grandiflorum*, with singularly hooded flowers of cream-white, freckled with greenish-brown; a pretty hybrid *Cattleya*, with pink flowers spotted with purple; *Cattleya Leopoldi*, two varieties of *Odontoglossum Bictonense album*, *Cattleya velutina*, and other *Cattleyas*.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, staged a small group, in which were *Cypripedium Lawrenceanum* Hyeum, Low's var., in which the yellowish-green of the original form was represented by bright emerald-green; *Laelio-Cattleya* × *elegans* var. *Enfieldense*, of a rich claret-crimson colour. The plant shown was small, and hence there is reason to believe it will become much finer. Messrs. Low also showed the pure white *Cypripedium bellatulum album*, *Lælia* × *Amanda*, *Cattleya bicolor* Wrigleyana, *Sobralia xantholeuca*, *Laelio-Cattleya* × *Aurora*, *Phalenopsis Aphrodite*, *Oncidium Lanceanum*, &c.

WALTER COBB, Esq., Dulcote, Tunbridge Wells, showed the pretty *Laelio-Cattleya* × *intermedia flava*, "Dulcote variety," with clear white sepals and petals, and rich rose-coloured lip.

Mr. THOS. HOGG, Woodside Gardens, Paisley, N.B., showed *Cypripedium* × *Lawrebel*.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, showed *Acineta colossa*, a curious species with flowers somewhat resembling those of *Peristeria elata* (Botanical Certificate).

Fruit Committee.

Present: H. Balderson, Esq., in the chair, and Messrs. G. Bunyard, H. W. Ward, A. Dean, J. H. Veitch, W. Bates, W. Farr, R. Hife, and J. Willard.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, exhibited fruits of a new Apple named Langley Pippin, from a cross between Mr. Gladstone and Cox's Orange Pippin. The fruit is of moderate size only, roundish, colour yellow, flaked with red or crimson. It is ripe by the middle of August, and in flavour is very similar to Cox's Orange (Award of Merit). Messrs. Veitch had also a specimen of *Rubus phoenicolasius*, about 9 feet high, pyramidal, and bearing a lot of fruit (Cultural Commendation).

Mr. J. W. MILLER, gr. to Lord FOLEY, Ruxley Lodge, Esher, Surrey, had six excellent dishes of fruits, consisting of Grosse Mignonne Peach, Alexandra Noblesse Peach from orchard-house, Alexandra from open wall, very finely coloured; also three dishes of very fine brown Turkey Figs (Cultural Commendation).

Some fruits from Messrs. T. RIVERS & SON, Sawbridgeworth, were remarkable for the extreme high quality they presented. There were about six dozens of the most tempting fruits of Oullin's Golden Gage, the same number of Late Transparent, and a few of McLaughlin's Gage Plums. The McLaughlin's Gage Plums were from a pot-tree, that has been plucked outside since the fruit set. Then there were Rivers' Early Silver Peach, from a cold-house, and upwards of a dozen wonderfully-coloured fruits of Dryden Nectarine, also from a cold house. Eight very large fruits of Peasgood's Nonsuch Apple completed the collection (Silver Banksian Medal).

A collection of fruit from the Dowager Lady FRAEKE, Fulwell Park, Twickenham (gr., Mr. Rickwood), was awarded a Silver Banksian Medal. It included Black Hamburgh Grapes, two Melons, Morello Cherries, Peaches, Nectarines, Figs, Plums, Apples, Pears, and Red and White Currants; in all about thirty dishes.
